

Appendix B – Proprietary Systems

A structure designed for the treatment of stormwater runoff from a new development has to meet all requirements of Chapter 500, Stormwater Management Law to be considered equivalent to any of the above systems. The Department has reviewed the design and performance data for each structure and can approve the following proprietary measures as an alternative, or as an integral part of the treatment train for stormwater management. Each approval letter identifies the specific design for sizing, layout, installation and maintenance requirements that are necessary for the system to perform as approved. Per this list, the most recent approval date of a letter will supersede any older version of the same.

The letters are found separately on DEB website:
