

## Locating a Site Assessor

A site assessor samples the soil during an underground storage tank removal to determine if a petroleum discharge has occurred. The site assessor presents the findings of this work in a written report that is submitted to the Department. The site assessment must meet the requirements of Chapter 691 Rules for Underground Oil Storage Facilities. The following options could be used to locate an assessor.

**Thru Tank Installers/Removers:** The Department certifies underground tank installers/removers. Depending on the type of oil product stored in the UST a certified installer/remover may be required when an underground storage tank is removed. These contractors generally subcontract assessors or may recommend an assessor. The Department can provide a list of certified tank installers/removers.

**In Yellow Pages or By Web Search; Categories:** Civil Engineers - Consulting Geologists - Geologists - Engineers - Environmental Engineers - Geotechnical Engineers - Environmental - Ecological

**Call firms on the following list:** Some of the firms on this list have more than one office location. Firms outside of Maine are not listed. The Department does not certify, endorse, or register site assessors and, consequently, has not maintained a complete list of assessors. The following companies have submitted a site assessment to the Department recently:
