

Salmonellosis

Definition:

Salmonellosis is caused by a bacteria called *Salmonella*.

Signs and symptoms:

Symptoms include diarrhea, fever and abdominal cramps. Illness lasts for 4 to 7 days.

Transmission:

Salmonellosis is primarily transmitted to a person through swallowing the bacteria from a contaminated item. Known exposures that result in illness include consumption of contaminated food, consumption of unpasteurized (raw) milk, consumption of water that has not been disinfected, contact with cattle or contact with the feces of infected people or animals.

Diagnosis:

Salmonellosis is diagnosed by clinical symptoms and laboratory tests. Laboratory tests include testing of stool, blood, or other sterile body fluid for the presence of salmonella bacteria.

Role of the School Nurse:

Prevention

- Provide education to students and staff regarding good hand washing with soap and water
- Promote proper hand washing after handling animals, especially reptiles and baby chicks or ducks or avoid having reptiles and baby chicks or ducks in the classroom
- Avoid swallowing water when swimming or playing in lakes, ponds, streams, swimming pools and backyard “kiddie” pools
- Exclude students symptomatic from school and school trips, especially involving swimming
- Provide education on good food safety practices
- Promote washing of fruits and vegetables
- Avoid unpasteurized dairy and juice products

Treatment Recommendations

- If symptoms are noted, the child should be referred to their primary care provider for treatment
- Non-specific supportive therapy, including hydration, is important
- Antibiotics should not be used to treat salmonellosis, except for severe, hospitalized individuals

Exclusions

- Students should be excluded from school while symptomatic with diarrhea

Reporting Requirements

- Salmonellosis is a reportable disease – report to 1-800-821-5821
