

PENQUIS DISTRICT:

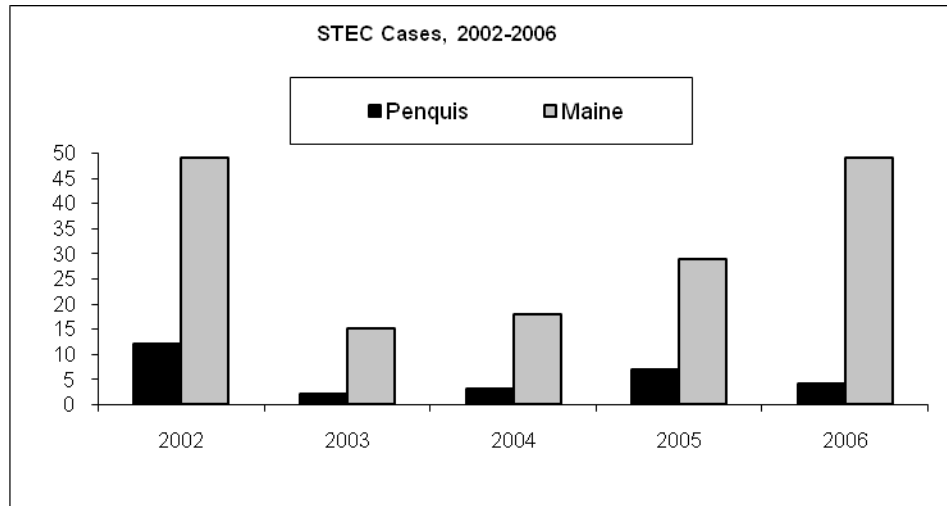

Infectious Diseases

Shiga Toxin Producing E. coli (STEC)

STEC is a leading cause of foodborne illness in Maine. It is a source of the food-borne illness associated with the life-threatening hemolytic uremic syndrome (HUS), particularly in children under five years of age. It can result in death; and causes fear and disruption for communities and businesses.

Decreasing STEC infections is an objective of *Healthy Maine 2010*. The Division of Infectious Diseases tracks and monitors cases and provides education and technical assistance to clinical providers and communities.

For more information on STEC: www.cdc.gov/ecoli.

	Penquis District Number	Maine State Number
STEC Cases 2002	12	49
STEC Cases 2003	2	15
STEC Cases 2004	3	18
STEC Cases 2005	7	29
STEC Cases 2006	4	49
