

## Unintentional Injury

Unintentional injuries were the leading cause of death among 1-44 year olds in Maine in 2000-2004, and the 6<sup>th</sup> leading cause of death among all ages combined. Motor vehicle crashes are the most common cause of unintentional injury deaths in the state.

Unintentional falls were the leading cause of injury hospitalization among Mainers aged 65 and older in 2001-2005. Hip fractures in this age group are usually caused by falls and can result in reduced quality of life or premature death. Hip fracture hospitalizations are a key measure of the problem, and falls can be reduced or prevented.

The Maine CDC’s Injury Prevention Program tracks and analyzes injury data and has recently revised the Maine Injury Prevention Plan. Contact the program at [www.maine.gov/dhhs/bohdcfh/inj/](http://www.maine.gov/dhhs/bohdcfh/inj/).
