

### MOULTON POND

Dedham and Bucksport, Hancock Co.  
U.S.G.S. Brewer Lake, ME (7 1/2')

#### Fishes

Brook trout	Minnows
Rainbow smelt	Golden shiner
White perch	White sucker
Chain pickerel	Pumpkinseed sunfish
	American eel

#### Physical Characteristics

Area- 45 acres	Temperatures
	Surface- 70°F
Maximum depth- 35 feet	35 feet- 52°F

Principal Fishery: White perch

Moulton Pond is located in the hill country around Lucerne in Maine. Presently, there is no public access.

An experimental brown trout stocking program was initiated in 1980. These stockings succeeded in establishing a generally satisfactory fishery. The pond proved to be a productive habitat as it yielded fair numbers of 3 to 4 pound trout along with some trophy-size fish in the 6 to 9 pound range. The two largest brown trout (known to be stocked fish) caught in Downeast Maine came from this pond. Brown trout grew extremely well by feeding on smelts, small white perch, and sunfish. Unfortunately, public access was lost in the mid-1980's, and the stocking program was terminated in 1987.

The pond provides a limited fishery for a few wild brook trout produced in a gravelly spring area. White perch provide a modest fishery, but many are in the 6 to 8 inch range.
