Hemlock Forest

State Rank S4

Community Description
This closed canopy forest type is dominated by hemlock (>50% cover) or, less often, hemlock is co-dominant with red spruce, white pine, or red maple; soils are typically not saturated; sparse herbaceous and bryoid layers.

Similar Types
White Pine - Mixed Conifer Forests have more white pine than hemlock. Mixed examples of this type can be transitional to Beech - Birch - Maple Forests, but hemlock will have >33% cover. Hemlock - Hardwood Pocket Swamps have wetland soils and vegetation, red maple and/or black gum co-dominant with the hemlock, and more well developed shrub, herb, and bryoid layers.

Soil and Site Characteristics
Hemlock forests are usually on slopes (typically 5-50%) and ravines, with well drained loamy soil. On lower slopes and flats, soils may grade to imperfectly drained. Soils tend to be shallow (<50 cm) and acidic (pH 4.8-5.6). Sites are from sea level to 1200' and often in cool microsites, although aspect varies.

Conservation, Wildlife, and Management Considerations
Demand in the 1700s -1800s for hemlock considerably reduced mature, undisturbed examples of this type, yet poor market conditions more recently have caused hemlock to be left in partial harvests; many of these legacy trees are quite old. Some evidence suggests that hemlock is less successful at maintaining itself in the face of human-caused disturbance than are northern hardwoods. Most sites known to be of high ecological quality are in southern and central Maine and lack formal protection. Maintaining the surrounding lands as forest is important in conserving particular stands of this type, particularly given that many known examples are small (<50 acres).

South of Maine, the hemlock woolly adelgid (an introduced insect) has decimated hemlock stands. It has recently been documented in York County, and efforts are underway to limit its impact.

This community type may be used as nesting habitat by a number of coniferous forest specialist bird species, such as the yellow-bellied flycatcher, blackthroated green warbler, blackburnian warbler, red crossbill, and northern parula.

Distribution
Statewide, less common northward; extends in all directions from Maine.

Landscape Pattern: Small to Large Patch

Examples on Conservation Lands You Can Visit
- Cooper Brook, Appalachian Trail – Piscataquis Co.
- Fourth Machias Lake, Duck Lake Public Lands – Washington Co.
- Little Concord Pond Public Lands – Oxford Co.
- Magoon Pond Public Lands – Penobscot Co.
- Scraggly Lake Public Lands – Penobscot Co
- Squa Pan Mountain, Squa Pan Public Lands – Aroostook Co.

Characteristic Plants
These plants are frequently found in this community type. Those with an asterisk are often diagnostic of this community.

Canopy
Eastern hemlock*
Paper birch
Red maple
Red oak*
Red spruce*
Sugar maple*
White pine*
Yellow birch*

Sapling/shrub
American beech*

Herb
Canada mayflower

Bryoid
Dicranum moss
Three-lobed bazzania
