RE: Juniper Ridge Landfill 2021 Annual Report

Dear Ms. Parmelee:

Enclosed for your review is the Juniper Ridge Landfill 2021 Annual Report and supporting documentation as required. Should you require additional information or clarification, please do not hesitate to contact me at 207-249-8025 or Wayne Boyd at 207-862-4200 ext. 224.

Respectfully submitted,

NEWSME Landfill Operations, LLC

Jeffrey Pelletier

1.0 INTRODUCTION

Pursuant to the requirements of 38 MRS §1310-N(6-D), this document, and associated attachments, serve as the 2021 Annual Report for the Juniper Ridge Landfill (JRL) located off Route 16 in Old Town, Maine. The information contained in this report also addresses the requirements of:

- Section 401.4.D of Maine Solid Waste Management Rules;
- Condition 19 of Solid Waste Order #S-020700-WD-N-A;
- Condition 4 of Solid Waste Order #S-020700-WD-W-M;
- Conditions 12, 14, 15, and 20 of Solid Waste Order #S-020700-WD-BI-N; and
- Condition 2 of Solid Waste Orders #S-20700-WD-CM-M.

As the contracted operator of the Juniper Ridge Landfill, NEWSME Landfill Operations, LLC (NEWSME), an indirect subsidiary of Casella Waste Systems, Inc. (CWS) is submitting this annual report to the Maine Department of Environmental Protection (MEDEP) on behalf of the Maine Bureau of General Services (BGS). Pursuant to P.L. 2011, Chapter 655, Sec. GG-69, on July 1, 2012 the Bureau of General Services in the Department of Administrative and Financial Services became the owner and licensee of JRL. Prior to July 1, the State Planning Office (SPO) owned JRL and held its licenses. The SPO was abolished on July 1, 2012.

1.1 Overview

JRL property consists of a 780-acre site accessed off Route 16 in Alton, with a physical address of 2828 Bennoch Road, Old Town, Maine. The licensed solid waste footprint of the JRL is approximately 122 acres. A location map of the JRL site and the surrounding facilities is shown on Figure 1-1. The JRL was originally licensed (#S-020700-7A-A-N) by the Board of Environmental Protection on July 28, 1993 as a generator-owned landfill for disposal of pulp and papermaking residuals generated by the Fort James Paper Mill located in Old Town, Maine. The original approved capacity of the facility was approximately 3 million cubic yards. Landfill operations began in Cell 1 in December 1996.

In June 2003, the Maine legislature passed Resolve 2003, Chapter 93, which authorized the State of Maine to pursue the purchase of the JRL from Fort James Operating Company. The final purchase agreement between SPO and Fort James would provide disposal capacity for the mill's waste for a 30-year period. On October 30, 2003, the SPO submitted an amendment application to the MEDEP to increase the approved final elevation of the landfill, and to dispose of additional waste streams at the facility.

On February 5, 2004, SPO formally purchased the JRL property from Fort James and signed an Operating Services Agreement with NEWSME to operate the facility for a 30-year period. At the same time, previously approved MEDEP operating licenses for the JRL were transferred to the SPO. On April 9, 2004, the MEDEP approved the amendment application and issued permit #S-020700-WD-N-A to the SPO to increase the original JRL capacity from approximately 3.3 million cubic yards to approximately 10.2 million cubic yards. An expansion of an additional 9.35 million cubic yards of capacity was approved for the site by the Maine Board of Environmental Protection (MEBEP) on June 1, 2017 with Board Order #S-020700-WD-BI-N and #L-19015-TG-D-N.

Since the execution of the Operating Services Agreement, NEWSME has been operating the site and is responsible for costs associated with development, operation and closure/post-closure activities at the JRL.

To date, Cells 1, 2, 3A, 3B, 4, 5, 6, 7, 8, 9, and 10 of the 2004 amendment license have been constructed; this accounts for the 68-acre landfill approved by the MEDEP Solid Waste Order #S-020700-WD-N-A. The last phase of filling the originally permitted landfill includes filling over the eastern and northern outer waste side slopes of the originally permitted landfill cells to achieve final waste grades of the 2004 permitted footprint. It is NEWSME's intent to fill this capacity in conjunction with the filling of expansion cells.

To date, Cells 11, 12 and 13 have been constructed as part of the 54-acre JRL expansion, approved by MEBEP Board Order #S-020700-WD-BI-N and #L-19015-TG-D-N. Cell 11 was constructed in 2018, followed by Cell 12 in 2020, and Cell 13 in 2021. Approval to commence waste placement in Cell 13 was issued by the MEDEP on September 14, 2021. In 2021 waste placement occurred primarily in Cells 11, 12, and 13, along with other adjacent cells located in the 2004 permitted footprint. Intermediate cover was placed once final waste grades were reached.

As of December 31, 2021, 6,184,207 cubic yards of total permitted capacity remained at the JRL. Of that total permitted capacity, 751,191 cubic yards remained in the previously constructed Cells 1 – 10 of the 2004 permitted footprint (#S-020700-WD-N-A), 1,193,007 cubic yards remained in the previously constructed Cells 11 and 13 (the first three of seven landfill cells to be built as part of the JRL expansion footprint (#S-020700-WD-BI-N)), and 5,433,016 cubic yards remained in the entire JRL expansion footprint (#S-020700-WD-BI-N).

1.2 Annual Report Format

This Annual Report contains the information required by Section 401.4.D of the Maine Solid Waste Management Rules (Rules), including a general summary of activities during 2021, a compliance evaluation performed by JRL's environmental manager, a summary of 2021 operations and operational information, a summary of facility site changes, a summary of the site monitoring performed at and around the site during 2021, an update of the costs and documentation of changes to the closure and post-closure funding of the facility, and a summary of best efforts by CWS to divert MSW from landfilling at the JRL to the greatest extent practicable.

2.0 SUMMARY OF SITE ACTIVITIES

2.1 Site Activities

The following landfill related site activities occurred at JRL during 2021:

- Construction of Cell 13 and associated infrastructure;
- Placement of soft layer/frost layer material in Cell 13, along with routine waste material placement in Cells 11, 12, and 13 of the expansion footprint;
- Continuance of waste material placement in the 2004 permitted footprint;
- An extension to JRL's perimeter fence beginning from the new scale and connecting to pre-existing infrastructure at the northwest corner of the 2004 permitted footprint;
- Installation of additional road gravel around the new scale house;
- Excavation and stockpiling of soils from the borrow area;
- Continued placement of intermediate cover on the 2004 permitted footprint and the side slopes of Cells 11 and 12 as waste grades were reached;
- Continued installation of new landfill gas collection components in the original 2004 permitted footprint and Cells 11/12 of the expansion. Components installed included new vertical LFG extraction wells, gas collection trenches, 12" header piping, and lateral extraction piping; and
- Construction of the Cell 14 underdrain.

2.2 Summary of Applications Submitted and/or Approved at JRL in 2021

Listed in Table 2-1 is a summary of MEDEP, Local, and Federal applications that were submitted and or approved at JRL during 2021.

Table 2-1 Summary of Applications Submitted and/or Approved at JRL, 2021

Application Description	Agency	Permit/License Number
Received an amendment to JRL Air License A-921-70-B-R to reflect updates in applicable USEPA Standards for MSW Landfills (from NSPS Subpart WWW to NSPS Subpart XXX and NESHAP Subpart AAAA)	MEDEP	A-921-70-H-A
Received a renewal of JRL Part 70 Air Emission License	MEDEP	A-921-70-F-R
Approval to modify the location of two groundwater monitoring transducers below the Cell 13 area from the expansion application	MEDEP	Approved (no permit issued)
Approval to modify Cell 13 geosynthetic material conformance sample collection	MEDEP	Approved (no permit issued)
Approval to begin Cell 13 pre-projects and ancillary tasks which were either outside of the cell footprint or at base grade	MEDEP	Approved (no permit issued)
Approval of the Cell 13 Construction Design Report and received condition compliance license	MEDEP	S-020700-WD-CL-C
Maine Construction General Permit - to perform the grubbing and stumping work for the perimeter chain link fence	MEDEP	Approved (after 14 day waiting period)
Federal Fish & Wildlife Permit Renewal (Bird Depredation)	US Department of Fish and Wildlife	MB670894-0
Approval of Permit Change Orders 1-3 and construction documentation report for Cell 13	MEDEP	Approved (no permit issued)
Approval to begin Cell 14 pre-construction activities	MEDEP	Approved (no permit issued)
Approval to commence soft layer material placement in Cell 13	MEDEP	Approved (no permit issued)
Approval to construct Cell 14 underdrain	MEDEP	Approved (no permit issued)
Approval to modify Cell 14 geosynthetic material conformance sample collection	MEDEP	Approved (no permit issued)
Received Solid Waste License Minor Revision to revise the expansion area OBW limit based on the previous five years OBW tonnage and the average CPI during the same period	MEDEP	S-020700-WD-CM-M

2.3 Compliance Self-Audit

As required by Section 401.4.D (1) (b) of the Rules, JRL performed an annual evaluation of landfill operations for calendar year 2021. A copy of the Audit is included as Attachment A of this report.

3.0 SUMMARY OF OPERATIONS

3.1 Types of Wastes Received at JRL during 2021

During calendar year (CY) 2021, JRL received and disposed a total of 882,124 tons of waste material. Table 3-1 summarizes the waste types received, along with their corresponding tonnages.

In compliance with JRL's permit condition, wastes going to the landfill were screened in advance to prevent out-of-state wastes from being accepted at the facility.

3.2 Estimates of Capacity Utilized during 2021 and Remaining Capacity

Listed below are estimates of capacity utilized and remaining for JRL based on June 24, 2021 aerial survey results. Since survey data for the entire site is utilized, these values account for capacity gains due to settlement, compaction, and waste decomposition. Further details are provided in Attachment I of this report, the 2021 JRL Geotechnical Monitoring Report. Within the report, please refer to Appendix B.

Disposal Capacity Utilized During 2021:

- 144,098 cubic yards in the 2004 permitted footprint (Cells 1-10)
- 1,130,494 cubic yards in the expansion footprint (Cells 11-13)

Disposal Capacity Remaining as of December 31, 2021:

- 6,184,207 cubic yards of total permitted capacity (Cells 1-17)
- 751,191 cubic yards in the constructed 2004 permitted footprint (Cells 1-10)
- 1,193,007 cubic yards in the constructed expansion footprint (Cells 11-13)
- 5,433,016 cubic yards in the entire permitted expansion footprint (Cells 11-17)

Table 3-1 Summary of Wastes Accepted at JRL, 2021

Summary of Wastes Accepted at Juniper Ridge Landfill Report Year 2021				
Waste Type #	Waste Types	Total (tons)	Origin	% Total Waste
1	Bypass MSW[5]	221,926	Maine	25.2
2	CDD/MSW Processing Residue - OBW (Disposed of in the Original 2004 Permitted Footprint)	8,874	Maine	1.0
3	CDD/MSW Processing Residue - OBW (Disposed of in the Expansion Permitted Footprint)[4]	73,561	Maine	8.3
4	CDD Processing Residue - Fines[1]	95,519	Maine	10.8
5	Mixed CDD	319,038	Maine	36.2
6	Wood from CDD[2]	44	Maine	0.0
7	Residue/Trash from Single Stream	6,683	Maine	0.8
	Special Wastes Types			
8	Burn Pile Ash and/or Hot Loads Area Ash	514	Maine	0.1
9	Catch Basin Grit & Street Sweeping	538	Maine	0.1
10	Coal, Oil & Multi-fuel Boiler Ash	3,250	Maine	0.4
11	Contaminated Soil & Debris	9,300	Maine	1.1
12	Dredged Spoils	1,593	Maine	0.2
13	Industrial (Miscellaneous)	40	Maine	0.0
14	Industrial WWTP Sludge	16,194	Maine	1.8
15	Leather Scraps	68	Maine	0.0
16	Lime Mud/Grit	3,461	Maine	0.4
17	MSW Incinerator Ash	28,210	Maine	3.2
18	Municipal WWTP/POTW Sludge	73,876	Maine	8.4
19	Non-Friable Asbestos	3,183	Maine	0.4
20	Non-Hazardous Chemical Related	1,108	Maine	0.1
21	Oil Spill Debris	2,803	Maine	0.3
22	Polyethylene & Cellulose Trimmings	9,619	Maine	1.1
23	Pulp Mill Waste	402	Maine	0.0
24	Sandblast Grit	494	Maine	0.1
25	Spent Septic Systems	104	Maine	0.0
26	Spoiled Foods	257	Maine	0.0
27	Sulfur Scrubbing Residues	838	Maine	0.1
28	Water/Air Filtration Media	10	Maine	0.0
29	WWTP Grit Screenings	617	Maine	0.1
SUBTOTAL WASTE TYPES 1-7		725,644	Maine	82.3
SUBTOTAL WASTE TYPES 8-29		156,480	Maine	17.7
GRAND TOTAL WASTE RECEIVED[3]		**882,124**	Maine	

1. Used as alternative daily cover (ADC).

2. Wood from CDD was received at the Juniper Ridge Landfill wood storage facility (ADC).

3. Total does not include purchased materials: tire chips (548.01 tons). Monthly reports included this purchased material. Total derived from sum of higher significant digit numbers, not rounded whole numbers as provided in the above table.

4. On 11/29/21, MEDEP approved an increase of OBW in the Expansion area. The previous limit of 65,000 tons per year, set by expansion license #S-020700-WD-BI-N, was modified through solid waste minor revision #S-020700-WD-CM-M. The minor revision approved additional disposal of OBW to 76,648 tons for calendar year 2021.

5. CRM/MRC 17,547.41 tons, ecomaine 23,924.29 tons, PERC 180,453.80 tons.

3.3 Estimates of the Amount of Cover Material Placed

During 2021, a mixture of synthetic and soil cover was utilized as final waste grades were reached. Approximately 5 acres of additional synthetic cover (30 and 40-mil) was added to the side slopes of Cells 11 and 12. Approximately 3 acres of soil cover was utilized on the north side slope of Cell 12.

Throughout 2021 operational areas received alternate daily cover (ADC). ADC is also used as a bedding layer on the waste side slopes prior to placement of the intermediate cover. Approved ADC materials utilized throughout the year included: CDD processing residue wood fines and clean wood from CDD after being chipped. Total ADC usage for 2021 amounted to 95,563 tons. Utilization of waste-related materials for daily cover and bedding for the intermediate cover obviated the use of virgin soil material.

3.4 Summary of Changes to the Facility's Operations Manual

Included as Attachment C are updated sections to include to the JRL Expansion Operations Manual (April 2021). Once included the Operations Manual will be complete and will be considered the April 2022 revision. The updated sections for the 2022 revision are listed below:

- Binder Cover/Spline Labels
- JRL Expansion Operations Manual Narrative Section
- Appendix A - MEDEP Operating Permits
- Appendix C - Operator Training Program Outline
- Appendix D - Cell Development Plans for Cell 14 (to add to previous cell plans)
- Appendix G - Waste Characterization and Acceptance Plan

3.5 Proposed Changes to the Operations Manual or Other Landfill Operations

During 2022, JRL staff plan to continue updating the revised April 2022 JRL Expansion Operations Manual as changes arise. Changes will likely occur with the addition of Cell 14, set to be constructed during the 2022 construction season.

In 2022, JRL will continue filling/shaping Cells 12, 13, and the north slope of the 2004 permitted footprint, until Cell 14 is constructed. Once constructed, the Cap 1 Area will be once again mined for soft layer material, if bypass MSW is not available or insufficient to the site's needs.

3.6 Responses to Spills, Fires, Accidents or Unusual Events at the Landfill

During 2021, the JRL facility experienced spills, fires, and waste related events. All spills were properly cleaned up by JRL Staff or a 3rd party environmental services company. Further details of the events are listed below.

Petroleum Related Spills

Two small petroleum related spills occurred in 2021. The MEDEP spill hotline was contacted on both events and the details are listed below.

1. A hydraulic spill occurred when a 3rd party hauler busted a hydraulic line while leaving the tip area of the landfill. A majority of the spill was contained within the open portion of the landfill, but the driver only realized the leak once he made it on the paved road. The spill was quickly cleaned up using a skid steer, speedy dry, and the sweeper.

2. A water/oil mixture spill occurred when the floor drain and underground holding tank for the shop overflowed with water. Onsite staff noticed the event and quickly shut the water off. A 3rd party environmental service company was called to empty the tank and pick up any residual that spilled across the paved driveway. A skid steer was also used to pick up anything in the dirt. The spill remained contained and did not leave the parking area around the shop.

Leachate Related Spills

No leachate related spills occurred in 2021.

Waste Related Fires

During 2021, on-site waste-related fires occurred at JRL. All fires were resolved by JRL site personnel. Fire events occurred in both active waste placement areas and/or areas where synthetic intermediate cover was installed. The MEDEP Project Manager was notified when the fires occurred and was made aware of how they started and were resolved.

Active waste placement fires were typically extinguished with the use of both water and/or soil to cool and eliminate air. Fires where Intermediate cover was placed were typically resolved using a combination of fire extinguishers, a bentonite slurry, water and soil cover, and then making the necessary synthetic cover repairs.

Damaged Intermediate Cover

During 2021, several small areas of synthetic immediate cover were damaged around landfill gas (LFG) infrastructure due to heavy rain/wind events. 3rd party crews were called in to make necessary repairs. JRL site personnel continuously try new things to better secure the cover material to prevent reoccurrences.

Waste Related Events

During 2021, two waste related events occurred at JRL in 2021. The first occurred on 03-17-21 and the second on 04-07-21. After these two events, the MEDEP was notified and informed of each occurrence. Additional information was provided if requested.

3.7 Updated Cell Development Plans

Cell 11, 12, and 13 plans will remain in the JRL Expansion Operations Manual, along with the future plans for Cell 14. Cell 14 is set to be constructed during the 2022 construction season and will represent the fourth cell of the 9.35 million cubic yard permitted expansion.

3.8 Copies of Reports Prepared in Accordance with the Landfill's Hazardous and Special Waste Handling and Exclusion Plan

During 2021, JRL submitted monthly special waste activity reports to the BGS, the City of Old Town, and the MEDEP. Reports were also and placed on the BGS's JRL website for the public and the Landfill Advisory Committee to access.

3.9 Inspections and Testing

During 2021, JRL personnel performed routine inspections of the landfill and infrastructure as outlined in the JRL Operations Manual. Copies of quarterly (routine) and weekly inspection reports may be found on file in the Environmental Manager's Office. Completed sample inspection sheets are included in Attachment D of this Annual Report.

3.10 Description of System Failures and/or Repairs

Routine and non-routine maintenance activities were performed on the leachate and landfill gas collection infrastructure, access roads, stormwater structures, and cover systems during 2021.

Leachate maintenance activities are listed chronologically in Attachment E. A summary of other identified landfill maintenance activities are listed in Attachment D.

During report year 2021, the following routine maintenance and/or repair functions were performed at the facility:

- Leachate maintenance and cleaning activities occurred as needed and in accordance with the Facility's Operations Manual;
- On-site stormwater structures were cleaned and/or repaired in accordance with standard BMP's to maintain erosion & sedimentation control during rain events;
- Various repairs were made to the existing 30/40-mil intermediate cover systems due to tears, rips, and/or holes from movement, settlement, or wind;
- Gas collection piping was repaired in multiple locations to accommodate for normal settlement and operations;
- Landfill gas (LFG) wellheads were repaired throughout the year due to normal wear and tear; and
- Access roads were graded and maintained as necessary to allow access to the facility.

4.0 FACILITY SITE CHANGES

During 2021, the following minor facility site changes not requiring Department approval occurred and are once again planned for 2022:

- Mowing, brush cutting, and other site maintenance upkeep;
- Continued safety and visual upgrades of the landfill paved access road;
- Continued improvements to stormwater control systems; and
- Continued efforts to mitigate wind-damage of landfill synthetic intermediate cover materials.

5.0 MONITORING

Water Quality

The 2021 Annual Water Quality Report for JRL is included as Attachment F of this report and includes an evaluation of the environmental monitoring data for the JRL site. During 2021, water quality samples were collected at JRL in accordance with the Environmental Monitoring Program (EMP), during April, July, and October.

Leachate Quality

Leachate quality was also evaluated and included as part of the 2021 Water Quality Report, Attachment F of this report. Below in Table 5-1, are leachate volumes of each pump station, along with total leachate hauled for 2020 and 2021. As seen, leachate flows decreased overall for 2021. This decrease was likely attributed to a change in weather patterns and an increase of installed synthetic/soil intermediate cover material.

Table 5-1 Leachate Total Comparison, 2020 & 2021

Total Leachate Pumped By Cell Pump Stations					
	Cell 4	**Cell 5**	**Cell 8**	**Cell 12**	**Cell 13**
2020	7,328,981	2,656,795	3,928,875	1,051,635	0
2021	6,547,858	3,324,483	3,262,395	942,260	630,250
Difference	-12%	20%	-20%	-12%	100%

Total Leachate Produced (Hauled) By Month			
	2020	**2021**	**Difference**
January	1,665,470	1,433,245	-16%
February	1,048,445	886,215	-18%
March	1,585,340	1,412,180	-12%
April	1,302,425	1,235,535	-5%
May	1,166,005	1,062,860	-10%
June	1,057,245	925,987	-14%
July	1,152,965	1,318,515	13%
August	1,001,035	1,001,495	0%
September	987,085	1,579,020	37%
October	1,303,400	1,458,840	11%
November	1,311,335	1,368,955	4%
December	2,405,515	1,556,495	-55%
TOTAL	15,986,265	15,239,342	-5%

Landfill Gas Monitoring

The 2021 Landfill Gas Monitoring Evaluation for JRL is included as Attachment G of this report. This routine landfill gas monitoring took place at various on-site gas management locations with results being submitted via electronic deliverable documents to the MEDEP as required.

The 2021 monitoring data associated with the landfill gas collection and treatment system indicates that the system is operating in accordance with the facility's air license.

Air Monitoring

The 2021 Air Monitoring Evaluation for JRL is included as Attachment H of this report. Two types of air monitoring activities occurred on-site during 2021; (1) hydrogen sulfide (H_2S) monitoring with stationary continuous monitors, and (2) quarterly methane (CH_4) emission surface scans on the landfill intermediate cover. Additionally, odor complaints from the 24-hour JRL odor complaint hotline provided an opportunity to evaluate the effectiveness of odor control measures at the JRL.

Geotechnical Monitoring

The 2021 Annual Geotechnical Monitoring Report for JRL is included as Attachment I of this report. During 2021, JRL continued to monitor site settlement and stability as in the past with the assistance of Dr. Richard Wardwell.

The report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and the Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application for a new solid waste license, as approved by the MEBEP under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017.

Results of this monitoring verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2021). Specifically, geotechnical monitoring during 2021 included: (1) visual observation of landfill slope stability, settlement, and general landfill conditions, (2) assessment of site aerial topographic surveys; (3) a review of waste types, quantities, location of waste placement, and filling sequences, and (4) evaluation of fluid levels in the leachate collection layer of Cells 11 and 12.

6.0 FINANCIAL ASSURANCE

The closure and post-closure costs have been recalculated to reflect those Cells that, as of the end of calendar year 2021, have been or will be constructed, but have not received final cover. A copy of the revised closure and post-closure costs may be found in Attachment J of this report. Following approval of the estimates, a revised financial assurance package will be submitted to the MEDEP under a separate cover.

7.0 MSW DIVERSION

In accordance with Condition #5 of Solid Waste Order #S-020700-WD-BC-A, a summary of best efforts by CWS to divert MSW from landfilling at JRL to the greatest extent practicable has been completed and may be found in Attachment K of this report.

ATTACHMENT A

Compliance Self Audit

JUNIPER RIDGE LANDFILL
COMPLIANCE SELF-AUDIT EVALUATION
REPORT YEAR 2021

This Compliance Self-Audit Evaluation is to be used to perform an annual audit of landfill operations as required by of Chapter 401, Section 4.D. (1) (b) of the State of Maine Solid Waste Management Rules. The purpose of this audit is to verify general compliance with the site operations manual, licenses and regulatory requirements. Qualified facility personnel performed the audit.

Facility Name………………. **Juniper Ridge Landfill (JRL)**

Location…………………….. **Old Town, Maine**

Audit for Calendar Year….. **2021**

Compliance Auditor……….. **Jeffrey M Pelletier**

Title…………………………. **Environmental Manager**

Signature of Auditor……….

GENERAL EVALUATION:

1. Are active facility licenses kept on file at the facility?

Copies of active MEDEP licenses may be found in the Environmental Manager's office located at Pine Tree Landfill. Licenses are also available electronically to the landfill supervisor and staff at the JRL site.

2. Do the facility licenses have special license conditions relating to landfill operations?

Yes, a number of conditions are laid out in various licenses held by the facility. MEDEP licensed conditions are entered into a company Environmental Compliance Database that allows the division manager and compliance manager to monitor compliance with submission deadlines and fee requirements.

3. What pending licenses or approvals were sought from the MEDEP at the time of this audit.

- Minor Revision Application (Solid Waste License # S-20700-WD-N-A) to add a Renewable Gas Facility at JRL (submitted on 01-19-22).
- Cell 14 Design Report Review (submitted on 01-25-22).
- 2022 Annual Oversized Bulky Waste Limit Request Form submittal (pursuant to Condition 2 (D) of Solid Waste Minor Revision License #S-020700-WD-CM-M) (submitted 01-28-22).

4. Date of payment of MEDEP Annual Report/License Fees.

- MEDEP 2021 annual report fee invoice will be paid once received.
- MEDEP 2021 annual license fee of $15,380.00 was paid on August 17, 2021.

5. Date of submittal of previous MEDEP Annual Report & Report/License Fees.

- MEDEP 2020 annual report was submitted on April 30, 2021.
- MEDEP 2020 annual report fee of $3,981.00 was paid on April 15, 2021.
- MEDEP 2020 annual license fee of $15,011.00 was paid on July 07, 2020.

6. Does the facility have a Host Community Agreement in-place and on file?

A Host Community Compensation and Facility Oversight Agreement was signed with the City of Old Town on December 8, 2005. Although not a host community, a Community Benefits Agreement also was signed with the Town of Alton on October 6, 2005. Copies of these agreements may be found in the Division Manager's Office.

7. Does the facility have a current liability insurance policy in-place and on file at the facility?

Yes, a copy of the policy is available in the Division Manager's Office.

8. Has the facility submitted an executed financial assurance instrument for closure and post closure care along with updated closure/post closure cost estimates to the MEDEP?

Yes, performance bonds were initially provided to the MEDEP on February 19, 2004. An updated financial assurance package for the closure/post-closure care is provided to the MEDEP within the annual report.

9. Last date a certified copy of the facility Operations Manual was updated.

An update to the JRL Expansion Operations manual was distributed in April 2021 alongside the 2020 Annual Report.

10. MEDEP approval date of last updated Operations Manual.

The facility Operations Manual was formally approved on June 01, 2017 as part of Solid Waste Order #S-020700-WD-BI-N.

11. Number and locations of the Certified Copies of the Operations Manual.

Certified copies of the Operations Manual may be found at the following locations:

- The Augusta Office of the MEDEP
- The Municipal Office of the City of Old Town
- JRL's Environmental Compliance Manager's Office
- JRL's Operations Supervisor's Office
- Manager of State Landfills at the Maine Bureau of General Services

12. Operational personnel who received landfill training during audit year.

During 2021, operations personnel received monthly training sessions on a variety of topics relating to safety, environmental compliance, and landfill operations. Records relating to the ongoing training of landfill personnel are kept on file in the Landfill Supervisor's office.

13. Are only solid wastes or special wastes as allowed in the landfill's current license accepted and are those wastes handled as described in the landfill's Operations Manual?

Yes, only approved non-hazardous special and solid wastes from Maine are being accepted at JRL and are being characterized according to the conditions laid out in the facility's Waste Characterization Plan.

14. Are solid wastes and special wastes permitted for acceptance characterized on an ongoing basis in conformance with the characterization plan approved by the Department?

Yes, those wastes are being characterized at the required intervals and/or tonnage rates. Records associated with waste acceptance are kept on file electronically.

15. Is access to the facility controlled so that the public is not exposed to potential health and safety hazards and access is only permitted when an attendant is on duty?

Yes, an attendant is located at the scale house during operational hours. During non-operational hours the facility is manned by security personnel that perform regular site inspections. For public safety reasons, non-employee visitors entering the site during operational hours must first stop at the scalehouse and check in prior to further entry. The site is secured with fencing. Doors and gates around the site are secured unless in use.

16. Are the hours of operation and other limitations for access and use prominently posted at the entrance to the landfill?

Yes, the facility has the required signage in-place at the entrance to the landfill prior to and at the scale house. Additional signage is placed in prominent areas throughout the landfill.

17. Are the access roads within the facility maintained?

Yes, roads from the entrance to the active landfill are maintained year-round to accommodate passage of vehicles.

18. Are any access roads into the active cell of the landfill constructed and maintained to prevent migration of leachate outside of the cell.

Yes, the main access road into the active cell is designed to prevent leachate from migrating outside of the cell.

19. Is a road maintenance program appropriately implemented to prevent the accumulation of dust, mud, or wastes from the facility access, public, or private roads?

Yes, paved roads are mechanically swept, scraped, and/or plowed as needed to prevent accumulation of undesirable material on the roads. Roads are additionally watered seasonally as necessary as a further dust control measure.

20. Are the appropriate signs posted or other approved means implemented to indicate clearly where solid waste is to be unloaded and the location of any separate handling areas?

Yes, drivers are directed by the scale house attendant and/or landfill operators to the proper staging/unloading area where they are then given further instructions via radio communications with the operators. Delivery vehicles utilizing the site are required to be equipped with a means of radio communication. Hand-held radios are made available as needed.

21. Are the setbacks and buffer strips approved by the Department being maintained?

Yes, required setbacks and buffers are being maintained as required.

22. Are the cell development plans up-to-date and submitted with the annual report?

Yes, cell development plans are included for Cell 14 which will be constructed throughout the 2022 construction season.

23. Is compaction performed at least once per operating day and more often as necessary unless otherwise approved by the Department?

Compaction is currently being achieved at JRL with the use of compactors that are operated in a manner to achieve favorable compaction rates.

24. Has cover been placed as outlined in the operations manual?

Yes, suitable waste materials, (i.e., alternate daily cover) are primarily being utilized as daily cover as necessary. Intermediate soil/synthetic cover materials are being installed as slopes reach appropriate elevation & grades.

25. Have storm water management and erosion control measures been implemented as outlined in the operations manual?

Yes, storm water management & erosion control measures are being utilized as outlined in JRL's Storm Water Pollution Prevention Plan, located in the Operations Manual.

26. Are leachate management systems including collection, transport, storage, and pumping systems maintained in accordance with the site Operations Manual?

Yes, systems receive regularly scheduled maintenance and are inspected at pre-determined intervals in accordance with the site Operations Manual.

27. Are landfill gas systems installed and maintained as outlined in the Operations Manual?

Yes, the landfill maintains an active gas collection system consisting of horizontal gas collection piping, vertical wells, and a flare.

28. Is a methane gas-monitoring program implemented to verify the concentration of explosive gases generated by the landfill, and if an exceedance is triggered, appropriate steps are taken to protect human health and the Department notified of the occurrence and the protective steps that were taken?

Yes, methane gas monitoring is being performed as required at the groundwater quality wells, landfill surfaces, at landfill structures, and LFG wellheads as required. The facility has developed a plan of action that needs to be followed should elevated levels be detected. No elevated levels of H_2S (a separate component of LFG) were detected in 2021.

29. Are routine inspections of the landfill facilities performed as outlined in the Operations Manual, and are records of the inspections kept on file at the facility?

Yes, routine inspections are performed at pre-determined frequencies in compliance with the site Operations Manual, with records of inspections kept on file in the Environmental Manager's office.

30. Does the facility have a fire protection plan in-place and is it outlined in the operations manual?

Yes, fire protection procedures are located in the JRL Operations Manual, and are being followed as required.

31. Does the facility have a hazardous and special waste handling and exclusion plan and is it implemented at the facility?

Yes, the hazardous and special waste handling and exclusion plan may be found in the Operations Manual. Appropriate response procedures are followed as required.

32. Does the facility have a litter control plan and is it implemented as outlined in the Operations Manual?

Yes, the facility controls off-site litter through the use of strategically placed fencing and regular litter patrols.

33. Has the Environmental Monitoring Program been implemented as outlined in the Operations Manual?

Yes, requirements as laid out in the environmental monitoring plan are being adhered to and are located in the Operations Manual.

34. Environmental sampling events being conducted as required and results reported to the MEDEP.

A record of environmental sampling events with corresponding dates may be found in the annual water quality report being submitted to the MEDEP as part of the Annual Report. Site water quality monitoring was completed on a tri annual basis in April, July, and October, with monitoring reports from those events submitted to the MEDEP. Required landfill leachate PFAS testing was completed in the fall of 2021 and reported to the MEDEP on 01-06-22.

35. Are waste staging and storage areas maintained as outlined in the Operations Manual?

Yes, staging and storage areas are being operated and maintained in accordance with the site Operations Manual.

36. Is a vector control program in-place and implemented as outlined in the operations manual?

Yes, a pest control service regularly visits the site and maintains control devices. Additionally, the facility utilizes lethal & non-lethal means of deterring bird populations.

37. Does the facility accept asbestos wastes?

The facility is only licensed to accept non-friable asbestos containing wastes and manages the material in a manner that minimizes exposure during offloading.

Annual Solid Waste Management Report

ANNUAL SOLID WASTE MANAGEMENT REPORT
FOR LICENSED LANDFILLS

FACILITY NAME: Juniper Ridge Landfill Report For Year: 2021

DEP LICENSE NUMBER #S-020700-WD-N-A & #S-020700-WD-BI-N

This report includes information on solid waste handling and disposal per 06-096 C.M.R. ch. 401, § 4(D) and § 7(21), as applicable, for the following facility and/or municipalities, as applicable (please list all users):

CONTACT PERSON: Jeffrey Pelletier Title: Environmental Manager
Mailing Address: 358 Emerson Mill Rd.
City/Town: Hampden Zip Code: 04444
Phone: 207-249-8025 E-mail: jeffrey.pelletier@casella.com

LANDFILL MANAGER: Wayne Boyd
Mailing Address: 358 Emerson Mill Rd.
City/Town: Hampden Zip Code: 04444
Phone: 207-862-4200 x224 E-mail: wayne.boyd@casella.com

■ **Please check here if a stand-alone annual report is being submitted. If so, submit this cover sheet only along with your report.**

I have examined this report to the best of my knowledge and believe this report is true, accurate and complete.

Signature of person completing this form: Jeff P Date Signed 04/29/22

Printed name of person completing this form: Jeffrey Pelletier

Please return one (1) paper copy and an electronic copy of your completed form with the required annual report fee by April 30th of each year to:

WEEKLY/MONTHLY INSPECTION FORM

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	09-02-21
Inspector Name/Signature	Jeffrey Pelletier

Note: For weekly inspections, only Table 1 and Table 3 need to be completed. For monthly inspections, Tables 1, 2 and 3 need to be completed.

Table 1
Inspection of Active Areas at the Facility

Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Borrow Pit	Is there evidence of tracking or erosion from site soil borrow areas with potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Mobile Equipment	Is mobile equipment leaking oil or other liquids with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)

Active Areas at the Facility	
Comments	Looks good

Table 2
Inspection of Stabilized Areas at the Facility

Stabilized Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Comments	Looks good		

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Detention Pond 1	Good
Geomembrane Lined Storage Pond	Good
Detention Pond 2	Good
Detention Pond 6	Good
Litter Fence	Good
Lechate Storage Tank Containment Area	Good
Leachate Storage Tank Containment Area Riprap Outlet	Good
Leachate Loading Rack Catch Basin	Good
Detention Pond 9	Good
2,000-Gallon Underground Storage Tank	Good
Detention Pond 5	Good
Outfall No. 1	Good
Outfall No. 2	Good
Outfall No. 3	Good

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Outfall No. 4	Good
Outfall No. 5	good
Outfall No. 6	good
Outfall No. 7	good ECM Could be refreshed. Completed by Sargent Corp. 09-10-21

In the comments section, enter physical description of floating, settled, and suspended solids for each outfall sampled. Enter general comments on the condition and appearance of each outfall in the comments as well as any corrective actions taken as indicated in the instructions.	
Outfall 7	Comments: Sample was cloudy but not really bad. Had light dirt smell, 1 ml settled solids, trace of suspended solids. Source of contamination were due to construction activities. BMPs put in place to help clean up water prior to leaving site. Several large check dams, filter stone, erosion control mix being utilized as required. Overall a job well done.

ROUTINE INSPECTION REPORT

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	09-02-21
Inspector Name/Signature	Jeffrey Pelletier / [signature]
Weather	Rain 56 °F

Does this inspection qualify as the one required annual inspection conducted during qualifying storm event? ☒ Yes ☐ No

Are there any new discharges or pollutants at the site? ☐ Yes ☒ No

Table 1
Inspection of Potential Pollutant Sources (PPS)

Description	
Industrial Activity or Area	**Describe where any of the following were observed:** • **Any discharges present at the time of inspection;** • **Any evidence of pollutants entering the drain system or outfalls;** • **The condition of the outfalls, including any restricted flow;** • **Industrial materials, residue or trash on the ground;** • **Leaks or spills from industrial equipment, drums, barrels, tanks or other containers;** • **Offsite tracking of industrial or waste materials or sediment; and** • **Tracking or blowing of raw, final, or waste materials.**
Scale House and Scale	Good
Office Building	Good
Soil Stockpile Areas	Good
Borrow Pit	Good / will need to be mulched but on Sargents Schedule. (Completed by Sargent sometime in October)
Wood Waste Handling Area	Good

Table 1
Inspection of Potential Pollutant Sources (PPS)

Maintenance Building	Good organized + clean
Rubb Building	Good
LFG Treatment Facility	Good clean
Leachate Storage Tank	Good no sign of leaks
Leachate Loading Rack	Good
Leachate Collection System	Good
Gravel Laydown Area	Good
Employee Parking Area	Good
1,500-Gallon Gasoline Tank	Good containment empty
1,500-Gallon Diesel Tank	Good not in use
2,500-Gallon Diesel Delivery Truck	Good in landfill cell
Access Roads	Good light litter here and there but not bad. Pickers onsite daily

Table 2
Inspection of Structural Control Measures and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly; • Any evidence of erosion; and • Industrial materials, residue, or trash.
Detention Pond 1	Good
Geomembrane Lined Storage Pond	Good
Detention Pond 2	Good
Detention Pond 6	Good
Litter Fence	Good
Leachate Storage Tank Containment Area	Good
Leachate Storage Tank Containment Area Riprap Outlet	Good
Leachate Loading Rack Catch Basin	Good
Detention Pond 9	Good
2,000-Gallon Underground Storage Tank	Good
Detention Pond 5	Good
Detention Pond 10	Good
Outfall No. 1	Good

Table 2
Inspection of Structural Control Measures and Outfalls

Outfall No. 2	Good
Outfall No. 3	Good
Outfall No. 4	Good
Outfall No. 5	Good
Outfall No. 6	Good
Outfall No. 7	ECM could be reAested completed by Sargent Corp. 09-[illegible]

2021 Juniper Ridge Landfill Other Maintenance Activities	
Below is a list of all other maintenance activities that occurred throughout 2021. A list of all leachate maintenance and cleaning activities is chronologically listed in Attachment E of the 2021 JRL Annual Report.	
Access Road Maintenance	
●	Access roads going to the top of the landfill and around the north, west, and south sides of the landfill perimeter were graded as necessary.
●	All access roads were swept and watered as necessary.
Landfill Cover System Maintenance	
●	Various repairs were made to the existing 30/40 mil intermediate cover system due to tears, rips, and holes from liner movement, settlement, and the wind.
Landfill Gas System (LFG) Maintenance	
●	Roughly 211 improvements were made to the LFG system throughout 2021. These improvements included: well/gas collection trench installations/extensions, maintenance to all collection well head components (valves, ports, hoses), and torn well boots.
●	The flare flame arrestor was cleaned periodically.
●	Routine maintenance was performed at the JRL Thiopaq Facility in accordance with the Facility's operations manual.
●	Condensate knockout pots (KOP) were cleaned as necessary.
Other Site Maintenance	
●	An extension of the security fence line was added, to incorporated future landfill expansion from the new scale location to the northwest side of the 2004 permitted landfill footprint.
Scale House Maintenance	
●	Additional gravel was installed along the road shoulders to better accommodate truck travel around the new scale house.
●	Scales were cleaned, de-iced, and calibrated as necessary.
Stormwater Maintenance	
●	All stormwater ditches on the north, west, and south sides of the landfill were cleaned. Culverts were cleaned and new rip-rap was installed as necessary.
●	Both sides of Detention Pond #5 were cleaned with new drainage sand installed.
●	New erosion control mix was added around the level lip spreader and prior to Outfall #2.
●	Seeding and mulching occurred as necessary to prevent erosion.
●	Continuous litter patrols were performed by 3rd party temporary personnel.

Leachate Collection Maintenance Activities

2021 Juniper Ridge Landfill Leachate Maintenance and Repairs	
01/22/21	Emptied surface water from the leachate force main manholes. Inspected the manholes and pressure gauges.
04/03/21	Flow meter verification performed on the leachate loadout rack and landfill pump stations.
04/15/21	Emptied surface water from the leachate force main manholes. Inspected the manholes and pressure gauges.
07/21/21	Emptied surface water from the leachate force main manholes. Inspected the manholes and pressure gauges.
09/07/21	Removed and cleaned leachate collection (LC) pump #2 from Cell 12 pump station. Reinstalled it in Cell 13 pump station for future use.
09/17/21	Inspected the leachate tank and force main, cleaned force main man hole structures.
09/27/21	Temporarily removed LC pump #1 from Cell 5 pump station. Replaced level transducer and safety transfer switch. Cleaned the pump, hose, discharge line, valves, and sump.
10/01/21	Removed and cleaned LC pump #1 from Cell 12 pump station. Reinstalled it in Cell 13 pump station for future use.
10/11/21	Located and marked out LC lines to be cleaned.
10/22/21	Cleaned LC lines around the east and southeast side of the landfill.
10/26/21	Cleaned LC lines around the north, west, and south sides of the landfill.
11/17/21	Emptied surface water from the leachate force main manholes. Inspected the manholes and pressure gauges.
11/22/21	Cleaned the remaining 4 LC lines and replaced bolts and hardware.

2021 ANNUAL WATER QUALITY REPORT
JUNIPER RIDGE LANDFILL

EXECUTIVE SUMMARY

Water quality samples were obtained in April, July, and October 2021 at the Juniper Ridge Landfill (JRL) in accordance with the current site Environmental Monitoring Plan. The 2021 water quality data for the JRL monitoring locations are consistent with the historical data for the site and with the setting of monitoring locations among the construction and operational activities of the landfill. Site groundwater and surface water quality data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The evaluation of site water quality, which incorporates the 2021 water quality data, identifies trends at multiple locations and for a number of parameters, both upgradient and downgradient from the landfill. Historical groundwater quality data through 2021 indicate that these trends, however, are largely attributable to landfill operations and changes in redox conditions, which occur as expected around the landfill due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.[1]

Leachate from monitoring location LT-C4LR during 2021 and historically since July 2013 is generally characterized by high parameter values. In 2021, the annual maximum value of specific conductance in JRL leachate (i.e., monitoring location LT-C4LR) was 21,200 µmhos/cm in July 2021. The annual maximum concentrations of chloride and arsenic at monitoring location LT-C4LR were 9,900 mg/L (April 2021) and 0.45 mg/L (October 2021), respectively. Generally, at a given water quality monitoring location, if landfill leachate were present, there would be a notable, significant increase in specific conductance values and chloride and arsenic concentrations (in conjunction with changes in other parameter concentrations) due to their presence at high concentrations in the JRL leachate.

Where there was flow during 2021 from underdrain monitoring locations, the underdrain monitoring data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. During 2021, annual maximum chloride concentrations from the sampled underdrain monitoring locations (ranging from 1.3 mg/L to 18 mg/L) were very low relative to the JRL leachate and do not indicate influence from the presence of landfill leachate. There were no volatile organic compounds (VOCs) detected in 2021 above laboratory reporting limits at any of the sampled underdrain locations.

Based on review of 2021 and historical groundwater data, SME has identified 24 of the 36 site-wide groundwater monitoring locations with water quality that: (1) do not indicate influence from landfill

[1] The MEDEP agreed with this assessment in its review of the 2017 Annual Report. MEDEP, February 20, 2018, Memorandum regarding the 2017 Annual Report, Juniper Ridge Landfill, Old Town, Maine, MEDEP Lic. #S-020700-7A-A-N and Amendment #S-020700-WD-N-A, Prepared by Sevee and Maher Engineers, Inc., April 2015.

leachate; and (2) shows limited influence from landfill construction operations. The annual maximum specific conductance values at these wells range from 111 µmhos/cm to 424 µmhos/cm. The annual maximum chloride concentrations at these monitoring locations ranged from 1.3 mg/L to 16 mg/L. These wells also exhibit limited or no statistically significant increasing trends.

More pronounced water quality changes have been observed at 12 of the site groundwater monitoring locations, which include wells both upgradient and downgradient from the landfill. These monitoring locations are discussed in detail in Section 7.3. The water quality changes are evidenced at some of these 12 groundwater monitoring locations by statistically significant trends for multiple parameters. These trends are largely attributable to changes in redox conditions, which occur as expected around the landfill due to the construction and operations of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate landfill related impacts to water quality from malfunction of the landfill liners. This conclusion is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations and leak detection monitoring locations.

Arsenic is the only parameter analyzed in groundwater monitoring wells detected above its U.S.EPA Maximum Contamination Level (MCL) or Maine Maximum Exposure Guideline (MEG) in 2021. There were only three of the thirty-two monitoring wells in the detection monitoring analytical program with arsenic concentrations detected above its MCL and MEG (0.01 mg/L) during 2021. The maximum arsenic concentration detected at site-wide monitoring locations was 0.021 mg/L during 2021. There were no arsenic concentrations detected above its MCL and MEG at pore-water monitoring locations or above its Maine Freshwater Criterion Continuous Concentration (MFCCC) at surface water monitoring locations in 2021.

The 2021 surface water, stormwater, and pore-water monitoring data are generally characterized by very low values of key indicator parameters by comparison to the JRL leachate (i.e., LT-C4LR). This is generally consistent with historical data at these locations.

Monitoring of the landfill leak detection sampling locations for Cell 11 and Cell 12 began in 2021. Annual maximum chloride concentrations were very low at these monitoring locations during 2021 (less than the laboratory reporting limit of 1.0 mg/L to 1.5 mg/L). These chloride concentrations do not indicate the presence of leachate in the leak detection systems for Cell 11 and Cell 12.

During 2021, SME performed four baseline water quality monitoring rounds at Cell 13 monitoring wells MW-503, MW-504, MW-505, MW-506, PW-08-01, P-04-11A, P-04-11B, OW-606B, OW-607B, OW-608B, and OW-609B. The baseline water quality monitoring data results from the Cell 13 monitoring wells were submitted to MEDEP in 2021. The Cell 13 monitoring locations were monitored for detection monitoring parameters in October 2021 and will be incorporated into the EMP in 2022.

1.0 INTRODUCTION

The Juniper Ridge Landfill (JRL) is a secure landfill located on a 780-acre parcel in Old Town, Maine. It is owned by the Maine Bureau of General Services (BGS) and is operated by NEWSME Landfill Operations, LLC (NEWSME). Since 2004, JRL has been an integral part of the State of Maine's overall solid waste management program, providing environmentally sound disposal capacity for non-hazardous solid waste generated throughout the State of Maine. Figure 1-1 shows the location of the site. Figures 1-2 and 1-3 show the general site layout and monitoring locations of the site in 2021.

Water quality has been monitored at the site since 1990 when the site was first selected for a landfill.[2] This report describes the results of the water quality sampling and an analysis of site water quality in 2021 completed by Sevee & Maher Engineers, Inc. (SME). The analysis compares the 2021 results to historical water quality at the Site, using statistical and graphical evaluations of trends in the data by sample location, and to State and Federal water quality standards. The analysis also looks at the water quality data in terms of the site conditions that exist at the JRL.

Sampling during 2021 was completed in general accordance with the current Environmental Monitoring Plan (EMP) for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017).[3,4] Descriptions of the 2021 water quality monitoring results are provided in this report. There were supplemental components to the 2021 water quality monitoring program, consisting of sampling and analyses for dissolved methane at one monitoring well and three pore-water sampling locations.

Monitoring of Phase II monitoring wells MW-507, OW-605A, OW-606A, OW-608A, and OW-611A, for which baseline analytical monitoring was performed in 2018, began under the current EMP specifications in 2021.

Monitoring of Cell 12 monitoring wells MW-04-09A, MW-04-09B, and MW-502, for which baseline analytical monitoring was performed in 2020, began under the current EMP specifications in 2021.

---

[2] The JRL was formerly known as the West Old Town Landfill and was owned and operated by Georgia-Pacific (previously known as Fort James and James River Paper Company) as a secure, non-hazardous, generator-owned waste disposal facility. A comprehensive description of the site setting and hydrogeology is contained in the 1991 report by SME entitled: *James River Paper Company Inc., West Old Town Landfill Project, Old Town Maine, Volume III, Site Investigation and Hydrogeologic Evaluation, August 1991*).

In addition to EMP and supplemental monitoring, baseline analytical monitoring for Cell 13 monitoring wells MW-503, MW-504, MW-505, MW-506, PW-08-01, P-04-11A, P-04-11B, OW-606B, OW-607B, OW-608B, and OW-609B was performed in 2021.

Descriptions of the site setting, facility layout, monitoring locations, analytical parameters, and 2021 site activities are also included herein.

1.1 Landfill Conditions

The JRL is designed and constructed as a secure waste disposal facility in that the groundwater beneath and adjacent to the site is protected by a composite liner and a leachate collection system. Leachate generated at the site in 2021 was collected and stored in an on-site storage tank and then transported to either the MEDEP licensed wastewater treatment facility at the Old Town Mill owned by Nine Dragons Paper or the City of Brewer's wastewater treatment facility for treatment.

Cells 1, 2, 3A, 3B, 4, 5, 6, 7, 8, 9, and 10 account for the 68-acre landfill approved by the Maine Department of Environmental Protection (MEDEP) Solid Waste Order #S-020700-WD-N-A. A landfill expansion was approved by Board Order #S-020700-WD-BI-N and includes expansion Cells 11 through 17. Cell 11 was constructed in 2018, Cell 12 was constructed in 2020, and Cell 13 was constructed in 2021. Development of Cell 13 included site grading, construction of the landfill perimeter dike and temporary pump station, installation of a new leachate force main, abandonment of boring B-16-102 and the former scale house building water supply well, and modifications to perimeter stormwater drainage ditches east, west, and north of the landfill. Intermediate cover and landfill gas collection piping and wells were installed within several areas of the active landfill cells in 2021.

Waste filling in 2021 occurred primarily in Cells 7, 8, 9, 12, and 13. In 2021, JRL received 882,124 tons of non-hazardous waste including, but not limited to, construction and demolition debris (CDD), municipal solid waste, front end process residue, incinerator and boiler ashes, sludges, CDD fines, contaminated soils, oil spill debris, and other solid waste for which the facility has either blanket or individual permits. As of December 2021, approximately 751,191 cubic yards of permitted capacity remained in Cells 1-10 and approximately 5,433,016 cubic yards of permitted capacity remained in Cells 11-17.

1.2 Hydrogeologic Setting

The existing JRL facility is located on the southwestern side of a northwest-southeast trending drumlin. The natural topography in the landfill area slopes downward to the southwest towards a large wetland and an unnamed stream that empties into Pushaw Stream (Class B). Pushaw Stream empties into the Stillwater River (Class B), which flows to the Penobscot River (Class B). Groundwater beneath the landfill is interpreted to follow the natural surficial topography and, therefore, generally flows towards the southwest and towards the unnamed stream. The large change in elevation from northeast to southwest across the landfill area results in upward groundwater seepage gradients near the unnamed stream and wetland area. Horizontal groundwater seepage gradients on the western side of the stream indicate that groundwater also moves from the west towards the stream; thus, the stream acts as a hydrologic barrier for groundwater flow from the landfill beyond the east side of the stream.

The site is underlain primarily by glacial till with marine clay of the Presumpscot Formation in the lower topographic areas (e.g., the wetlands in the southwestern portion of the site). Throughout the site, the glacial till generally consists of a very dense brown till grading to very dense gray till with depth. The till typically ranges from 20 to 50 feet thick beneath the landfill and thus provides a natural containment layer for the landfill. At a few locations outside of the landfill boundary, bedrock outcrops are exposed at the ground surface. In addition, there were several isolated, discontinuous, washed till zones found beneath the till. However, these discontinuous washed till zones are often found within finer grained glacial tills.

Bedrock beneath the facility has been identified as a light gray and brown metagraywacke and metaquartzite interbedded with dark gray phyllite. The metasediments are typically competent and unfoliated, except for zones within the phyllite. The bedrock is mostly unweathered, although some discontinuous weathered zones have been observed. No faulting has been observed in bedrock cores and there are no faults mapped in the vicinity of the site. The bedrock surface beneath the landfill is locally variable; however, the surface generally slopes towards the southeast towards a bedrock trough that exists in the vicinity of the wetlands and unnamed stream at the southwest corner of the site.

The interpreted shallow groundwater phreatic surface and upper bedrock groundwater potentiometric surface contour maps for the JRL site are provided in Appendix B. These maps represent interpretations of the potentiometric surfaces using site data from 2007 and 2008. As expected, the groundwater elevations at the site monitoring wells have declined since then as a result of the cut-off of recharge from precipitation in the area of the landfill liner systems. The 2021 site groundwater level conditions do not result in a significant change to the interpreted groundwater flow directions or the groundwater flow divides at the site, particularly with regard to monitoring groundwater and surface water. Linear trendlines of groundwater elevations later than 2007 were calculated for twenty-nine of the site's thirty-six current groundwater monitoring locations to evaluate water level changes during the time period ending in October 2021 (see Appendix B for water level and trendline plots). The average slopes of linear trendlines during this period were used to quantify the approximate rates of groundwater elevation changes at site groundwater monitoring locations, which are summarized in Table 1-1.

TABLE 1-1

2021 SUMMARY OF SITE GROUNDWATER ELEVATION TRENDS

Location Designation [1]	Position Relative to Landfill	Date Range for Analysis	Total Groundwater Elevation Change During Date Range for Analysis (feet-NGVD)	Rate of Groundwater Elevation Change (feet/year)
OW-602A	Downgradient (Expansion)	Apr-18 to Oct-21	-7.39	-2.118
OW-604A	Downgradient (Expansion)	Apr-18 to Oct-21	-7.26	-2.082
OW-601A	Downgradient (Expansion)	Apr-18 to Oct-21	-6.11	-1.753
OW-601B	Downgradient (Expansion)	Apr-18 to Oct-21	-4.84	-1.388
P-206A	Upgradient	Jul-13 to Oct-21	-6.87	-0.840
OW-06-03	Downgradient (Expansion)	Apr-18 to Oct-21	-2.68	-0.767
MW12-303R	Upgradient	Oct-12 to Oct-21	-5.23	-0.584
MW-302R	Downgradient	May-08 to Oct-21	-4.40	-0.329
OW-608A	Downgradient (Expansion)	Apr-18 to Oct-21	-1.02	-0.292
MW04-102	Downgradient	May-07 to Oct-21	-1.58	-0.110
P-04-04	Downgradient	May-07 to Oct-21	-1.58	-0.110
MW-206	Upgradient	May-07 to Oct-21	-1.05	-0.073
MW04-105	Downgradient	May-07 to Oct-21	-1.05	-0.073
MW-223A	Downgradient	May-07 to Oct-21	-1.05	-0.073
MW-223B	Downgradient	May-07 to Oct-21	-0.53	-0.037
MW-204	Downgradient	May-07 to Oct-21	-0.53	-0.037
MW-227	Downgradient	May-07 to Oct-21	-0.26	-0.018
MW-402B	Downgradient	May-07 to Oct-21	-0.16	-0.011
MW04-109R	Downgradient	Dec-09 to Oct-21	-0.13	-0.011
MW-401B	Downgradient	May-07 to Oct-21	-0.16	-0.011
DP-4	Downgradient	May-07 to Oct-21	-0.05	-0.004
P-04-02R	Downgradient	Jul-15 to Oct-21	-0.02	-0.004
MW-401A	Downgradient	May-07 to Oct-21	-0.02	-0.001
MW-04-09B	Downgradient (Expansion)	Feb-20 to Oct-21	0.01	0.004
MW-04-09A	Downgradient (Expansion)	Feb-20 to Oct-21	0.05	0.029
MW09-901	Downgradient	Dec-09 to Oct-21	2.16	0.183
MW-507	Downgradient (Expansion)	Apr-18 to Oct-21	1.54	0.438
OW-611A	Downgradient (Expansion)	Apr-18 to Oct-21	1.54	0.438
OW-605A	Downgradient (Expansion)	Apr-18 to Oct-21	1.66	0.475

Notes:
1 Site monitoring locations are described in Section 2.0.

As shown in Table 1-1, twenty-three of the twenty-nine monitoring wells included in this analysis have downward water level trends for data collected later than 2007. Five of the monitoring locations included in Table 1-1 (OW-06-03, OW-601A, OW-601B, OW-602A, and OW-604B) are located downgradient of the landfill expansion and have now been monitored since 2018. Early monitoring of groundwater elevation trends at these locations shows that the cut-off of recharge from precipitation by the Cell 11 landfill liner system has resulted in groundwater elevation change rates ranging from -0.767 feet per year (feet/year) at OW-06-03 to -2.118 feet/year at OW-602A.

Monitoring locations MW-507, MW-605A, MW-608A, and MW-611A, located downgradient from the landfill expansion, were monitored for baseline analytical parameters in 2018 and monitoring began under the current EMP specifications in 2021. The groundwater elevation decreased at MW-608A between 2018 and 2021 at a rate of -0.292 feet/year. The groundwater elevations increased between 2018 and 2021 at monitoring locations MW-507, MW-605A, and MW-611A at average annual rates of 0.438 feet/year, 0.475 feet/year, and 0.438 feet/year respectively.

Monitoring locations MW-04-09A and MW-04-09B, located downgradient from the landfill expansion, were monitored for baseline analytical parameters in 2020 and monitoring began under the current EMP specifications in 2021. The groundwater elevations increased between 2020 and 2021 at monitoring locations MW-04-09A and MW-04-09B at average annual rates of 0.029 feet/year and 0.004 feet/year, respectively.

The remaining monitoring locations are upgradient or downgradient from all or a portion of Cells 1 through 10 of the JRL. The cut-off of recharge from precipitation by the landfill liner systems has generally resulted in greater rates of groundwater elevation decline at the three upgradient monitoring locations. The upgradient monitoring locations have groundwater elevation change rates of -0.840 feet/year at P-206A, -0.584 feet/year at MW12-303R, and -0.073 feet/year at MW-206. Thirteen of the fourteen downgradient monitoring locations analyzed for groundwater elevation trends for data collected later than 2007 have declining groundwater elevation trends, but generally at lesser rates than at the upgradient monitoring locations. These downgradient monitoring locations have a range in groundwater elevation decrease rates from -0.110 feet/year at MW04-102 and P-04-04 to -0.001 feet/year at MW-401A. The one monitoring location downgradient of Cells 1 through 10 of the JRL with an increasing groundwater elevation trend is MW09-901, which is a deep groundwater well located west of Cell 5. Monitoring location MW-302R has a greater rate of groundwater elevation decline than the downgradient monitoring locations; however, the declining groundwater elevation rate of -0.329 feet/year at MW-302R is partly attributed to the lining of the adjacent Detention Pond #5 in 2013.

Site monitoring wells MW-301, MW-402A, MW-501, MW-502, MW06-01, OW-603B, and OW-606A are not included in the analysis summarized in Table 1-1. Monitoring locations MW-301, MW-402A, MW-502, MW06-01, and MW-603B show indications of declining water levels but were not included since the rates of decline cannot be quantified with available data. Monitoring well MW-501 and MW-606A have been flowing during each of the monitoring events in 2018 through 2021.

Monitoring well MW-301 is located downgradient from the JRL and the former leachate pond. Groundwater elevation data from MW-301 show slight declines from 2007 through 2012. MW-301 was found to be damaged during the April 2013 monitoring round. It was repaired prior to the July 2013 monitoring round and since that time has had reported average groundwater elevations in the order of 4 feet higher than values prior to the repair. Groundwater elevation data from MW-301 show slight declines from 2013 through 2021.

Monitoring well MW-402A is located downgradient from the JRL and the former leachate pond. Groundwater from MW-402A was reported as flowing from the top of the well casing from when it was first sampled in April 2009 through October 2012. Since then, the groundwater has been reported as intermittently flowing. These observations signify an overall slight decline of groundwater elevations at MW-402A from 2009 through 2021. Similarly, groundwater intermittently flows from monitoring well MW06-01. The groundwater elevations appear to be trending down for water levels measured below the top of the well casing at MW06-01. Groundwater was flowing from MW-502 during its first three baseline monitoring events in 2020 but was below the top of casing during the final baseline monitoring event (August 2020) and during the 2021 monitoring events.

Monitoring well OW-603B is a shallow overburden monitoring well that has had decreasing water levels since its first baseline monitoring event in 2018. The groundwater elevation has dropped by more than 8 feet between April 2018 and the end of 2021. Monitoring well OW-603B is periodically dry, including during the July 2021 and October 2021 monitoring events.

In addition to the cut-off of recharge from precipitation by the landfill liner systems, groundwater elevations at the site are affected by the amount of precipitation that falls on the site. Preliminary monthly climate data from the National Climatic Data Center (NCDC) for Bangor, Maine indicates a 2021 total precipitation of 40.85 inches, which is 0.86 inches below the normal precipitation reported by the NCDC for Bangor, Maine. The average groundwater elevations were generally higher in 2021 at most groundwater monitoring wells compared to 2020, when there was a total precipitation of 37.60 inches. The higher average groundwater elevations during 2021 are likely also influenced by unusually high precipitation totals in July 2021 (7.67 inches) and September (9.42 inches) and the timing of monitoring events in or soon after those months.

2.0 MONITORING LOCATIONS

Sampling during 2021 was completed in general accordance with the current EMP for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017).

2.1 2021 Monitoring Locations

Sampling events during 2021 were completed in April, July, and October 2021. In 2021, water quality samples for the detection monitoring program were obtained by SME from 36 groundwater monitoring wells and piezometers,[5,6,7,8] three pore-water sample locations, three surface water locations, three stormwater locations, three underdrain locations,[9] two leak detection locations,[10] and one leachate monitoring location. Measurement of field parameters (e.g., temperature and specific conductance) at the underdrain locations that contained water were completed on a monthly basis by NEWSME personnel.

The site monitoring points are summarized in Table 2-1 and Table 2-2 and their locations are shown on Figures 1-2 and 1-3. Information on the geologic formation in which each monitoring well is screened, as well as the elevation and distance below ground of each monitoring well screened interval, is listed in Table 2-1.

---

[5] Three of the site groundwater monitoring wells (DP-4, MW04-105, and MW-204) are sampled only during the fall monitoring event, and for field parameters only. Ten of the site groundwater monitoring wells (OW-06-03, OW-601A, OW-601B, OW-602A, OW-603B, OW-604A, OW-605A, OW-606A, OW-608A, and OW-611A) are sampled for detection monitoring parameters only during the summer monitoring event and are monitored for field parameters only during the spring and fall monitoring events.

[6] Monitoring wells OW-605A, OW-606A, OW-608A, and OW-611A were sampled for field parameters and the detection monitoring parameters in July 2021 and October 2021. The current EMP specifies that these locations be monitored for field parameters only during the spring and fall and for field parameters and detection monitoring parameters during the summer. The current EMP specifications will be applied to these wells for 2022 monitoring.

[7] Monitoring wells MW-502, MW-507, MW-04-09A, and MW-04-09B were sampled for field parameters and the detection monitoring parameters in July 2021 and October 2021. The current EMP specifies that these locations be monitored for field parameters and detection monitoring parameters during the spring, summer, and fall. The current EMP specifications will be applied to these wells for 2022 monitoring.

[8] Monitoring location OW-603B was dry during the April 2021, July 2021, and October 2021 monitoring events.

[9] Samples were obtained from three underdrain monitoring locations during one or more of the three 2021 sampling events. Nine additional locations were not sampled due to dry conditions (LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1). No composite samples were required to be taken at Manhole #5 (LF-COMP) and Manhole #7 (LP-COMP) in 2021; however, a composite sample was taken from LF-COMP in April 2021 (see Section 2.6).

[10] Leak detection monitoring locations LF-LD-11 and LF-LD-12 were sampled for field parameters and the detection monitoring parameters in July 2021 and October 2021 and for field parameters only in August, September, November, and December 2021. The current EMP specifies that these locations be monitored for field parameters and detection monitoring parameters during the summer monitoring event and for field parameters monthly. The current EMP specifications will be applied to these monitoring locations for 2022 monitoring.

TABLE 2-1

2021 GROUNDWATER MONITORING LOCATIONS

Location Designation	Position Relative to Landfill	Screen Depth Interval (feet below ground surface)	Ground Surface Elevation (feet-NGVD)	Screen Interval Elevation (feet-NGVD)	Geologic Formation Screened
MW-204 [1]	Downgradient	13.8 – 18.8	164.0	150.2 – 145.2	Overburden
MW-206	Upgradient	15.0 – 20.0	200.9	185.9 – 180.9	Overburden
P-206A	Upgradient	85.5 – 90.5	201.5	116.0 – 111.0	Bedrock
MW-223A	Downgradient	28.0 – 33.0	173.4	145.4 – 140.4	Bedrock
MW-223B	Downgradient	12.6 – 17.6	173.3	160.7 – 155.7	Overburden
MW-227	Downgradient	15.0 – 20.0	160.8	145.8 – 140.8	Overburden
MW-301	Downgradient	162.7 – 182.7	163.5	0.8 – -19.2	Bedrock
MW-302R	Downgradient	19.5 – 29.5	204.5	185.0 – 175.0	Bedrock
MW12-303R	Upgradient	30.4 – 40.4	206.1	175.7 – 165.7	Overburden
MW-401A	Downgradient	98.8 – 108.8	153.6	54.8 – 44.8	Bedrock
MW-401B	Downgradient	10.0 – 20.0	154.2	144.2 – 134.2	Overburden
MW-402A	Downgradient	95.5 – 105.5	149.3	53.8 – 43.8	Bedrock
MW-402B	Downgradient	12.0 – 22.0	149.7	137.7 – 127.7	Overburden
DP-4 [1]	Downgradient (In proximity of former leachate pond)	18.5 – 24.5	165.5	147.0 – 141.0	Overburden
P-04-02R	Downgradient (In proximity of former leachate pond)	27.1 – 32.1	168.0	140.9 – 135.9	Overburden
P-04-04	Downgradient (In proximity of former leachate pond)	27.2 – 32.2	166.7	142.1 – 137.1	Overburden
MW04-102	Downgradient (In proximity of former leachate pond)	10.0 – 15.0	167.0	157.0 – 152.0	Overburden
MW04-105 [1]	Downgradient (In proximity of former leachate pond)	14.8 – 19.8	162.2	147.4 – 142.4	Overburden
MW04-109R	Downgradient (In proximity of former leachate pond)	15.0 – 20.0	157.1	142.1 – 137.1	Overburden
MW-04-09A	Downgradient Expansion	38.0 – 39.0	167.0	128.0 – 129.0	Bedrock
MW-04-09B	Downgradient Expansion	14.0 – 15.0	167.0	152.0 – 153.0	Overburden
MW09-901	Downgradient	15.0 – 20.0	161.9	146.9 – 141.9	Overburden
MW-501	Downgradient Expansion	57.0 – 67.0	163.2	96.2 – 106.2	Bedrock
MW-502	Downgradient Expansion	38.0 – 43.0	TBD	TBD	Bedrock
MW-507	Downgradient Expansion	20.0 – 220.0	174.7	-45.3 – 154.7	Bedrock (Open Borehole)
MW06-01	Downgradient Expansion	10.0 – 20.0	163.3	143.3 – 153.3	Overburden
OW-06-03 [1]	Downgradient Expansion	10.0 – 15.0	203.0	188.0 – 193.0	Overburden
OW-601A [1]	Downgradient Expansion	88.0 – 98.0	214.9	116.9 – 126.9	Bedrock
OW-601B [1]	Downgradient Expansion	51.0 – 61.0	214.5	153.5 – 163.5	Overburden
OW-602A [1]	Downgradient Expansion	52.0 – 62.0	211.7	149.7 – 159.7	Bedrock
OW-603B [1]	Downgradient Expansion	34.0 – 44.0	205.1	161.1 – 171.1	Overburden
OW-604A [1]	Downgradient Expansion	39.0 – 49.0	195.8	146.8 – 156.8	Bedrock
OW-605A [1]	Downgradient Expansion	60.0 – 260.0	184.7	-75.3 – 124.7	Bedrock (Open Borehole)
OW-606A [1]	Downgradient Expansion	40.0 – 240.0	157.0	-83.0 – 117.0	Bedrock (Open Borehole)
OW-608A [1]	Downgradient Expansion	60.0 – 260.0	196.1	-63.9 – 136.1	Bedrock (Open Borehole)
OW-611A [1]	Downgradient Expansion	20.0 – 220.0	183.1	-36.9 – 163.1	Bedrock (Open Borehole)

Notes

1 MW-204, DP-4, and MW04-105 were sampled only during the fall sampling event for field parameters only. Ten of the site groundwater monitoring wells (OW-06-03, OW-601A, OW-601B, OW-602A, OW-603B, OW-604A, OW-605A, OW-606A, OW-608A, and OW-611A) are sampled for detection monitoring parameters only during the summer monitoring event and are monitored for field parameters only during the spring and fall monitoring events.

TABLE 2-2

2021 SURFACE WATER, STORMWATER, LEACHATE, LEAK DETECTION, AND UNDERDRAIN MONITORING LOCATIONS

Location Designation	Water Body Description
SW-1	Unnamed tributary of Pushaw Stream
SW-2	Unnamed tributary of Pushaw Stream
SW-3	Unnamed tributary of Pushaw Stream

Notes
[1] NEWSME personnel complete monthly underdrain and leak detection monitoring.

During 2021, SME also performed baseline water quality monitoring at the Cell 13 monitoring wells. Baseline groundwater samples were collected from eleven groundwater monitoring wells. Monitoring wells MW-503, MW-504, MW-505, PW-08-01, P-04011A, P-04-11B, OW-607B, OW-608B, and OW-609B were sampled for baseline parameters in February, April, June, and August 2021. Monitoring well MW-506 could not be sampled in June 2021 because the groundwater level was too low to pump with a peristaltic pump. A bladder pump was installed at MW-506. Monitoring well MW-506 was sampled for baseline parameters in February, April, July, and September 2021. Monitoring well OW-606B was frozen in February 2021 so it was sampled for baseline parameters in April, June, July, and August 2021. The Cell 13 monitoring wells were also sampled in October 2021 for detection monitoring parameters.

The locations of the Cell 13 monitoring wells are shown on Figure 1-2 and they are summarized in Table 2-5. The baseline water quality monitoring is further discussed in Sections 2.10, 3.2, and 7.5.

2.2 Groundwater Locations

Groundwater monitoring wells MW-206, P-206A, and MW12-303R are positioned upgradient of the landfill.

Groundwater monitoring wells MW-204, MW-223A, MW-223B, MW-227, MW-301, MW-302R, MW-401A, MW-401B, MW-402A, MW-402B, and MW09-901 are positioned downgradient of the landfill. Groundwater monitoring wells P-04-02R, P-04-04, MW04-102, MW04-105, MW04-109R, and DP-4 are located in the proximity of the former leachate pond[11] and are also downgradient of the landfill.

Groundwater monitoring wells MW-501, MW-502, OW-06-01, OW-06-03, OW-601A, OW-601B, OW-602A, OW-603B, OW-604A, OW-605A, and OW-606A are positioned east and downgradient of the landfill expansion. Groundwater monitoring wells MW-507 and OW-611A are positioned west and downgradient of the landfill expansion. Groundwater monitoring wells MW-04-09A, MW-04-09B, and OW-608A are positioned north and downgradient of the landfill expansion.

2.3 Surface Water and Stormwater Locations

Surface water monitoring locations SW-1, SW-2, and SW-3 are located in the unnamed tributary to Pushaw Stream. SW-1 and SW-3 are located downstream of the landfill while SW-2 is located upstream of the landfill. Stormwater sample monitoring locations SW-DP1, SW-DP5, and SW-DP6 are located at the discharge locations of Detention Pond #1, Detention Pond #5, and Detention Pond #6, respectively.

2.4 Pore-Water Locations

Stream-based pore-water sample locations PWS10-1, PWS10-2, and PWS10-3 are located downgradient of the landfill along the unnamed tributary to Pushaw Stream and represent water in the overburden adjacent to the stream.

2.5 Leachate Sample Location

During the 2021 sampling events, leachate samples were obtained from the on-site leachate storage tank (i.e., LT-C4LR). Leachate samples associated with compliance monitoring for off-site wastewater treatment are also obtained at the same location. The sampling location at the leachate storage tank, LT-C4LR, is shown on Figure 1-2.

2.6 Underdrain Monitoring

The sample locations where underdrain samples were obtained in 2021 are shown on Figures 1-2 and 1-3 and a diagram of the underdrain collection system is included on Figure 2-1. By design, the sampling of the landfill underdrain system provides a means to monitor for landfill cell leakage as the underdrains underlie the landfill liner system. Manhole MH #5, located northeast of the former leachate pond, is the

[11] The former leachate pond has been used as a stormwater storage pond since the summer of 2008.

SEVEE & MAHER ENGINEERS

\\Nserver\cfs\Casella\OldTownLandfill\General\SiteInfo\Acad\EMP.dwg, UD MONLOCS FIG2-1, 4/5/2022 7:45:21 AM, sjm sample location which receives groundwater entering the underdrains beneath Cells 1, 2, 3A, 3B, 4, and 7. The sampling location for the underdrain for Cell 6 (LF-UD-6) is from a stilling well in the underdrain line. The base grades for Cell 5 and Cell 6 were designed such that the Cell 5 underdrain would also accommodate flow from the Cell 6 underdrain. The combined flow from the Cell 5 and Cell 6 underdrains then drain to a 6-inch diameter pipe outfall located on the southern perimeter of the landfill. Beginning in June 2010, samples obtained from this 6-inch diameter pipe outfall are now a composite sample from the Cell 5 and Cell 6 underdrains (LF-UD-5and6); prior to June 2010, samples obtained from this 6-inch diameter outfall pipe were for the Cell 5 underdrain only (LF-UD-5).

The underdrain for Cell 8 was constructed in 2012 at a discrete location shown on Figure 2-1. LF-UD-8 was added to the monitoring program during the April 2013 sampling event as the underdrain monitoring location for Cell 8. The underdrain for Cell 9, LF-UD-9, was constructed in 2015 and was added to the monitoring program during the April 2016 sampling event. With the construction of Cell 10 in 2017, the underdrain piping and sample collection location for the underdrain for LF-UD-9, which was located in a temporary underdrain manhole adjacent to Cell 9, was extended to the south outside of the Cell 10 perimeter berm. The underdrain for Cell 10, LF-UD-10, was constructed in 2017 outside of the southern perimeter berm of Cell 10 and was added to the monitoring program during the October 2017 sampling event.

Manhole location MH #7, which is located southwest of the former leachate pond, is the sample location for LP-UD-1 and LP-UD-2, which monitor groundwater entering the southern and northern underdrains, respectively, of the former leachate pond.

Underdrain samples were obtained by SME as part of routine monitoring and analyzed for the detection monitoring parameters. Samples were also obtained monthly by NEWSME for field parameters. The underdrain sample locations LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5and6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LP-UD-1, and LP-UD-2 were sampled during 2021, unless those locations were dry or their sample pipe inverts were submerged.

Historically, during times when LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7 were not able to be sampled separately due to pipe invert submergence, LF-COMP has been obtained from the manhole MH #5. This sample provides a composite sample of the subject underdrain locations. Sample pipe submergence did not occur during the three 2021 detection monitoring events. LF-COMP samples were obtained from manhole MH #5 and analyzed for field parameters during each of the twelve 2021 monthly monitoring events.

While it was not required, LF-COMP was sampled during the April 2021 monitoring event due to a communication error. There was no flow from any of the inlet pipes (i.e., LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7) during the April 2021 monitoring event, which is not typical. The April 2021 detection monitoring results from LF-COMP do not represent water quality during a time when LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7 were not able to be sampled separately due to pipe invert submergence.

Composite LP-COMP samples were not obtained during the routine monitoring events in 2021 because pipe invert submergence did not occur at individual sample locations LP-UD-1 and LP-UD-2. LP-COMP samples were obtained and analyzed for field parameters during each of the twelve 2021 monthly monitoring events.

2.7 Leak Detection Monitoring

Monitoring of the leak detection sampling locations for Cell 11 (LF-LD-11) and Cell 12 (LF-LD-12) began in 2021. Monitoring locations LF-LD-11 and LF-LD-12 are shown on Figure 2-1.

2.8 Annual Monitoring Well Specific Conductance Measurements

Specific conductance measurements were taken in 2021 from an expanded list of monitoring wells surrounding the existing landfill operations at JRL during the October monitoring event. This specific conductance sampling has occurred since 2008 when the MEDEP made a request that these samples be obtained. Locations measured annually for specific conductance are listed in Table 2-4 and shown on Figure 2-2. The results of the 2021 and historical fall specific conductance measurements are included in Appendix C.

2.9 Water Quality Landfill Gas Monitoring Program

Concurrent with the routine water quality monitoring events in 2021, site monitoring wells, underdrain locations, leachate manholes, a leak detection manhole, and JRL site property boundaries were monitored for the presence of landfill-related gases using a hand-held GEM 2000 gas meter. Figures 1-2 and 1-3 show the gas monitoring locations associated with the landfill's water quality monitoring program. The results of the 2021 and historical landfill gas monitoring are discussed in Section 8.0.

2.10 Baseline Water Quality Monitoring Wells for Cell 13

Baseline water quality for Cell 13 monitoring wells was completed in 2021. Baseline monitoring locations are shown in Table 2-5. The locations of these wells are shown on Figure 1-2 and well construction details are summarized in Table 2-5.

TABLE 2-5

3.0 MONITORING PARAMETERS

3.1 Detection Monitoring Program

Table 2-3 shows the monitoring locations where detection monitoring was performed in 2021. Sampling during 2021 was completed in general accordance with the current EMP for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017). The detection monitoring parameters are listed in Table 3-1. In instances where Table 2-3 shows a monitoring location is monitored for field parameters only, measurements are taken for groundwater elevation, specific conductance, dissolved oxygen, pH, temperature, turbidity, monitoring well pumping rate, and surface water flow rate.

Analysis for volatile organic compounds (VOCs) was included during the April monitoring event for multiple locations (LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5and6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LP-UD-1, LP-UD-2, and MW-401B), provided that there was sufficient water available to sample at these locations. LF-COMP was also monitored for VOCs in April 2021. The leachate samples from LT-C4LR were analyzed for the same VOCs list during the April, July, and October 2021 monitoring events. The leachate location (LT-C4LR) was also analyzed for the parameters listed in Appendix A, Column 3 of the Chapter 405 MEDEP Solid Waste Regulations during the April 2021 monitoring event. The Cell 13 baseline monitoring program monitoring wells were also each monitored four times for VOCs during 2021.

A supplementary addition to the 2021 monitoring program included sampling and analysis for dissolved methane at monitoring well MW-223B and pore-water sampling locations PWS10-1, PWS10-2, and PWS10-3 in April, July, and October 2021. The results of the supplementary dissolved methane monitoring are discussed in Sections 7.3 and 7.4 Dissolved methane is also included in the EMP for the JRL expansion.

Notes:

1 In April 2021, leachate samples from LT-C4LR were analyzed for Appendix A, Column 3 parameters (from Chapter 405 MEDEP Solid Waste Regulations).

2 At dilution factor of unity. Some PQLs may differ for surface and stormwater analysis.

3 NA = Not Applicable.

4 VOCs are the 47 organic constituents listed in Appendix I of 40 CFR Part 258. Diethyl ether and tetrahydrofuran were added to the list of VOCs in 2016 at the request of MEDEP. PQLs for VOCs are reported at a dilution factor of unity.

5 Monitoring wells and leachate only.

6 Surface waters, stormwater, pore-water, and underdrain only.

7 Surface waters only (excluding stormwater detention ponds and underdrains).

8 In April 2021, LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5and6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LP-UD-1, LP-UD-2, and MW-401B were analyzed for VOC compounds, unless those locations were dry. LF-COMP was also monitored for VOCs in April 2021.

9 Underdrain and landfill expansion monitoring locations only.

10 Cells 1 through 10 monitoring locations only.

3.2 Baseline Analytical Program for Monitoring Wells for Cell 13

Baseline analytical monitoring for Cell 13 monitoring wells was performed in 2021 at the eleven monitoring locations shown in Table 2-5. Each Cell 13 baseline monitoring location was sampled four time during 2021. The Cell 13 monitoring wells were also sampled in October 2021 for detection monitoring parameters. The results of the baseline analytical monitoring are summarized in Section 7.5.

TABLE 3-2

Notes:
1 At dilution factor of unity. Some PQLs may differ for surface and stormwater analysis.
2 NA = Not Applicable.
3 VOCs are the 47 organic constituents listed in Appendix I of 40 CFR Part 258 plus diethyl ether and tetrahydrofuran. PQLs for VOCs are reported at a dilution factor of unity.

4.0 SAMPLING TECHNIQUES

4.1 Monitoring Wells

Groundwater samples from monitoring wells and piezometers are obtained utilizing the low-flow sample collection techniques in general accordance with the EMP for the JRL. The low-flow sampling program includes dedication of 1/8-inch diameter (I.D.) polyethylene tubing in each well. The tubing is secured at the top of the well such that the inlet of the tubing is placed approximately at the middle of the screen zone in each well. Prior to sampling, the static water level is measured in each well. A peristaltic pump with an adjustable flow rate is used to purge and sample monitoring wells with relatively shallow water tables. Monitoring wells with water tables greater than 28 feet below ground surface are sampled with dedicated submersible pumps rather than a peristaltic pump due to the depth of the groundwater.

The low-flow sampling procedure at the JRL consists of purging the monitoring wells at approximately 100 to 200 milliliters per minute. While the wells are purged, water levels and measurements of specific conductance, temperature, pH, Eh, dissolved oxygen, and turbidity are taken through a flow-through-cell at regular intervals. Field parameters and water level measurements are monitored to determine if parameter stabilization has occurred as outlined in the EMP. Once stabilization of the field parameters has occurred, in particular water levels and turbidity, a sample is obtained for chemical analysis. Several of the wells have very low recharge rates and, therefore, do not stabilize even under these low purge rates. For these wells, a sample is obtained after purging the liquid present in the sampling tube and pump.

4.2 Surface Water, Stormwater, Underdrain, and Leachate Sampling Locations

Grab samples are obtained at the surface water, stormwater, underdrain, and leachate sampling locations, which is consistent with historical sampling methods and in accordance with the EMP. These samples are not filtered prior to analysis.

4.3 Pore-Water Sampling Locations

The pore-water samples are obtained in the following manner:

1. The pore-water sampling apparatus (i.e., pore-water sampler) is decontaminated with an Alconox® and deionized water solution followed by several deionized water rinses.
2. The area to be sampled is entered from an area downstream from the sample point. Caution is used not to disrupt the area where the pore-water sampler will be used.

3. The pore-water sampler is gently pushed approximately two feet into the soil surface in the sampling location area specified in the EMP. The inner rod remains inside of the pore-water sampler as it is pushed into the soil surface in order to maintain the integrity of the pore-water sample.
4. Once the pore-water sampler is advanced approximately two feet into the soil surface, the inner rod is removed and a new, clean piece of polyethylene tubing is attached to the top of the pore-water sampler using a new, clean silicone tube coupling.
5. Water is pumped from the pore-water sampler at a rate of approximately 100 to 200 milliliters per minute with a peristaltic pump.
6. Field parameters are monitored at a regular interval until stabilization criteria are met, or until the pore-water sampler runs out of water. If the pore-water sampler runs out of water, it is allowed to recharge and samples are then obtained for laboratory analyses.
7. After sampling is complete, the pore-water sampler is removed from the soils and a labeled grade stake is installed at the sampling location that clearly identifies the location for future sample collection from the same general location.

4.4 Water Quality Landfill Gas Monitoring

Gas monitoring at the monitoring wells, underdrain locations/manholes, leak detection manhole, and JRL site property boundaries is done using a GEM 2000 gas meter manufactured by Landtec of Colton, California with an auxiliary H_2S pod. Measurement of headspace gas in the monitoring wells is accomplished by placing the probe tip into the upper few inches of the well casing immediately after the well cap is removed. Gas measurements at underdrain and leak detection manhole locations are measured by placing the probe at the manhole opening where samples are obtained. The meter is calibrated daily before use. Methane-equivalent, carbon dioxide, and oxygen are reported as percent by volume. Hydrogen sulfide is reported in parts per million by volume.

4.5 Sample Handling and Chain-of-Custody

After obtaining the water quality samples in 2021, the samples were preserved on ice in coolers and shipped by SME to Maine Environmental Laboratory (MEL) of Yarmouth, Maine for analyses. Eastern Analytical, Inc. of Concord, New Hampshire, under subcontract to MEL, performed the nitrate plus nitrite, dissolved methane, and VOC analyses. Katahdin Analytical Services (Katahdin) of Scarborough, Maine, under subcontract to MEL, performed the analyses for total Kjeldahl nitrogen, semi-volatile organic compounds (SVOC), herbicides, pesticides, and polychlorinated biphenyls (PCBs). Chain-of-custody sheets prepared by the sampling personnel accompanied the samples and contain the signatures documenting the transfer of the water quality samples from the field sampler to the receiving laboratory.

5.0 DATA VALIDATION AND QUALITY ASSURANCE (QA)/QUALITY CONTROL (QC)

QA/QC activities associated with sampling include the utilization of standardized collection procedures and sample data records, calibration of field instruments, and the use of chain-of-custody procedures. SME followed the EMP procedures to ensure that both the field instruments and protocols employed generate data that are reliable and provide valid analysis results. Instruments were calibrated, analyses were conducted to determine potential matrix interference as necessary, precision and accuracy were checked, and hold-times were verified. Analytical QA/QC involves the use of approved analytical protocols by a qualified laboratory. Water quality samples were all analyzed within the required hold-times.

Data validation and laboratory quality control procedures were followed and documented as described in the MEDEP Solid Waste Management Rules, Chapter 405. During 2021 monitoring events, duplicate water quality samples were obtained from several monitoring locations, as discussed in water quality data submittals for each round. Reports on Relative Percent Difference (RPD), calculated ratios of total dissolved solids to specific conductance, and values falling outside of historical ranges for each monitoring event were presented in each of the three data transmittals provided in 2021.

6.0 DATA ANALYSIS

Detailed discussion and evaluations of the water quality from sampling locations are presented in Section 7.0. Appendix D contains tables of historical water quality data collected over the past ten years, including 2021, for the sampling locations and parameters identified in this report. Water quality data for the site have been quantitatively evaluated using the methods described below and qualitatively evaluated based on the knowledge of the site hydrogeologic conditions developed from the extensive site investigations completed onsite and the status of site development and operations. Conclusions about site water quality are based on a combination of the quantitative and qualitative methods used to evaluate the water quality data.

6.1 Concentrations above MCL, MEG, MFCCC

Parameters measured at the site groundwater monitoring wells and pore-water sample locations that were above their respective U.S.EPA Maximum Contamination Levels (MCLs) or Maine Maximum Exposure Guidelines (MEGs) during 2021 are identified in detail in Sections 7.3 and 7.4. Parameters measured at the site surface water and stormwater monitoring locations that were above their Maine Freshwater Criterion Continuous Concentrations (MFCCCs) are identified in detail in Section 7.4.

6.2 Key Indicator Parameters for Comparison to JRL Leachate

For each of the site monitoring locations, specific conductance, chloride, and arsenic concentrations are summarized as key indicator parameters for comparison to JRL leachate concentrations. Generally, at a given water quality monitoring location, if landfill leachate were present, there would be a notable, significant, increase in specific conductance values and chloride and arsenic concentrations (in conjunction with changes in other parameter concentrations) due to their presence at high concentrations in the JRL leachate. In 2021, the annual maximum value of specific conductance in JRL leachate (i.e., monitoring location LT-C4LR) was 21,200 µmhos/cm in July 2021. The annual maximum concentrations of chloride and arsenic at monitoring location LT-C4LR were 9,900 mg/L (April 2021) and 0.45 mg/L (October 2021), respectively.

Specific conductance gives an indication of the total dissolved constituents at each monitoring location. Chloride is useful in assessing the site water quality in comparison to JRL leachate due to its conservative nature in terms of adsorption, precipitation, and degradation in the groundwater environment. It is important to note that increases in chloride may also be due to runoff and recharge from salting or dust control of nearby roadways. Therefore, increases in chloride levels also need to be reviewed in terms of site conditions.

Currently, there are limited occurrences of arsenic MCL/MEG (0.01 mg/L) exceedances in site groundwater that are attributed to reducing conditions associated with decreasing groundwater recharge from site development. These reducing conditions are interpreted to favor reductive dissolution of arsenic and iron hydroxides that are present naturally in the soils and bedrock, which results in the release and mobility of dissolved arsenic in the groundwater. The highest arsenic concentration at JRL water quality monitoring locations in 2021 (0.021 mg/L at MW-402B in October 2021) is more than an order of magnitude lower than in the JRL leachate in 2021. The historical maximum arsenic concentration in the JRL leachate is 0.6 mg/L (July 2017). The occurrence of arsenic concentration increases in JRL water quality monitoring locations, accompanied by increases in specific conductance values and chloride concentrations, may be a reliable indicator of landfill impacts resulting from the presence of JRL leachate.

Bromide was added to the monitoring program during 2013. Section 7.1 includes an evaluation of the chloride to bromide ratios for the JRL leachate during 2021 and how they compare to chloride to bromide ratios for site monitoring locations during 2021.

6.3 Box and Whisker Plots and Data Summary Sheets

Water quality data for each monitoring location are summarized in the data summary sheets contained in Appendix E of this document. The summary sheet prepared for each sampling location contains a map and description of the monitoring point, a 2021 water quality data summary, and a statistical summary of the historical data prior to 2021. Parameter concentrations that exceeded historical minimum and maximum concentration values in 2021 at site monitoring locations are identified on the individual water quality summary sheets contained in Appendix E.

Also included in Appendix E are box and whisker plots of select monitoring parameter data for each of the sampling locations. The box and whisker plots graphically illustrate the annual concentration ranges and annual median value for the analytical results of each parameter shown and also provide a useful way to visually identify long-term and short-term trends in the water quality data. Plotting the range of annual values on the box and whisker plots also provides a sense of the variability of the annual data (statistically expressed as a standard deviation) and whether or not an apparent trend may be real or lies within the inherent variability of the data. Visual observation of water quality trends over time using the historical data (including 2021 data) is aided by using a fast-Fourier transform regression of each of the select parameter annual mean concentration values. Graphs of the fast-Fourier regression are part of the box and whisker plots in Appendix E.

6.4 Mann-Kendall Trend Analyses

Mann-Kendall trend analyses were run for the JRL water quality data to screen for potential statistically significant changes in water quality parameter concentrations over time. The Mann-Kendall analysis was chosen because it is nonparametric and is robust to outliers, missing data, and non-detects. Time-series plots of water quality parameter concentrations often contain multiple trends over time, due to various factors. In order to evaluate current trends for this annual report, the Mann-Kendall trend analyses were run for the site data over two time periods; from the end of 2021 back five years and three years. The three-year and five-year timeframes are suitable for evaluating changes in water quality related to more recent conditions, and to identify ongoing longer trends.

The Mann-Kendall test was run with a 0.05 Type-I error (i.e., 95% confidence level). For this evaluation, we consider a statistically significant trend to be one in which the potential Type-I error (i.e., false positive) is less than 0.05. The Mann-Kendall results for groundwater, surface water, stormwater, leachate, and underdrain locations are provided in Appendix F and are discussed by location in Section 7.0. It should be noted that individual parameter trend analysis calculations using analytical data that are typically non-detect are at times positive for increasing or decreasing trend screenings due to changes in the laboratory reporting limit. In those cases, trends are interpreted and reported herein as no trends. This occurrence is somewhat frequent for some parameters for JRL site water quality due to generally low parameter concentrations in groundwater at the site. This condition occurred in 2021 analyses for five-year statistically significant decreasing trends for total Kjeldahl nitrogen at MW-227, MW-301, MW-401B, and MW-402A.

Although rapid increases in concentrations of multiple parameters at a monitoring location may reflect site operational impacts such as spillage of leachate or landfill liner leakage, changes in multiple parameter values at a given monitoring location can also result from changes in groundwater conditions unrelated to the landfill leachate. As an example, decreases in natural precipitation recharge to the groundwater will change redox, alkalinity, and pH conditions, which results in the release of various constituents such as iron, manganese, and arsenic from soils and bedrock into the groundwater. Nearly all chemical constituents are subject to changes in concentrations resulting from interactions between soil, rock, and groundwater.

Increases in multiple (four or more) parameters, especially when including key indicator parameters, are noted in our evaluation of the water quality in the site monitoring locations. [12] At locations where this criterion is met, further assessment of water quality data and site conditions is completed to ascertain the potential causes for the change in water quality.

The trend analyses are used as a screening tool to review the water quality and must be viewed in conjunction with other factors such as the specific parameters exhibiting trends and the parameter

[12] Water temperatures, water elevations at groundwater monitoring locations, and flow rates at underdrain monitoring locations are included in the Mann-Kendall results in Appendix F but are not included in discussions related to water quality changes based on the number of parameters with increasing or decreasing trends at a given location.

concentrations detected at the monitoring locations (i.e., a specific parameter could have an increasing trend, but remain within a range consistent with upgradient concentrations). The results of the trend screening analyses are compared visually with the time-series plots (box and whisker plots) described above to aid in assessing the actual significance of a statistical trend.

6.5 Stiff and Piper Diagram Construction

Stiff and Piper Diagrams were constructed for several of the monitoring locations to assist in the evaluation of water quality at these locations in 2021. These diagrams are graphical representations of select parameters that display the major ion composition of a water quality sample. They were used at several of the monitoring locations to compare the ionic composition of the water quality samples to other sample results such as upgradient locations and/or the landfill leachate to assess potential sources of water at the wells. This can be a valuable tool to compare water quality between various locations since it can be used to “fingerprint” ionic ratios, independent of concentration. See Appendix G and Appendix H for Stiff and Piper diagrams.

7.0 WATER QUALITY EVALUATION

Groundwater, surface water, stormwater, leachate, and underdrain water quality samples were obtained in 2021 at monitoring locations as described in Section 2.0 of this report. Samples were obtained during April, July, and October 2021. Laboratory analytical reports, field data sheets, and data validation documentation have been presented in tri-annual data submittals forwarded to the MEDEP during 2021 for each monitoring event.

The 2021 water quality data for the JRL is generally consistent with the historical data for the site. The 2021 water quality data from monitoring locations at the JRL are consistent with their setting among the construction and operational activities of the landfill. Site groundwater, surface water, and underdrain quality data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. Water quality changes have been observed at the JRL, both upgradient and downgradient from the landfill, as evidenced by the statistically significant trends discussed in this section for multiple parameters and monitoring locations. These trends are largely attributable to landfill operations and changes in redox conditions, which occur as expected around the landfill due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.[13]

Arsenic is the only parameter analyzed in groundwater monitoring wells that was detected above an MCL in 2021. During 2021, arsenic concentrations were generally low at the site-wide monitoring locations. There were only three monitoring wells in the detection monitoring analytical program with arsenic concentrations detected above its MCL (0.01 mg/L) during 2021. The maximum arsenic concentration detected at site-wide monitoring locations was 0.021 mg/L at MW-402B in October 2021. There were no arsenic concentrations detected above its MCL at pore-water sampling locations in 2021. There were no arsenic MFCCC exceedances during 2021 at surface water monitoring locations SW-1, SW-2, and SW-3.

Low arsenic concentrations in 2021 are a continuation of a trend observed since 2017 of generally site-wide lower concentrations of arsenic compared to their recent previous concentrations. In contrast to 2021 arsenic data, all routine monitoring wells (19 at the time) and two of the three pore-water sampling locations had arsenic MCL exceedances during one or more sampling event in 2016.

The presence of arsenic at JRL monitoring locations in 2021, while limited, is attributed to reducing conditions associated with decreasing groundwater recharge from site development. These reducing conditions are interpreted to favor reductive dissolution of arsenic and iron hydroxides that are present

[13] The MEDEP agreed with this assessment in its review of the 2017 Annual Report. MEDEP, February 20, 2018, Memorandum regarding the 2017 Annual Report, Juniper Ridge Landfill, Old Town, Maine, MEDEP Lic. #S-020700-7A-A-N and Amendment #S-020700-WD-N-A, Prepared by Sevee and Maher Engineers, Inc., April 2015.

naturally in the soils and bedrock, which results in the release and mobility of dissolved arsenic in the groundwater.

Observations relative to the site water quality data for 2021, in terms of historical and regulatory comparisons and site setting, are discussed below for: leachate (Section 7.1); underdrains (Section 7.2); groundwater (Section 7.3); and surface water, stormwater, and pore-water (Section 7.4) monitoring locations. Water quality parameter data not specifically discussed in this report are considered to be consistent with the previously obtained water quality data for the JRL. The baseline analytical monitoring results of eleven new monitoring locations downgradient from Cell 13 in 2021 are discussed in Section 7.5.

7.1 Leachate

The landfill leachate is sampled and analyzed as part of the ongoing water quality monitoring program. Leachate samples were obtained from the on-site leachate storage tank (i.e., LT-C4LR) during 2021. Leachate sampling location LT-C4LR replaced the former leachate sampling location in July 2013 in order to obtain leachate samples that are representative of leachate from all of the landfill cells. The leachate at LT-C4LR was sampled for the parameters in the detection monitoring analytical program (see Table 3-1) in July 2021 and October 2021 and was sampled for the parameters listed in Appendix A, Column 3 of the Chapter 405 MEDEP Solid Waste Rules during the April 2021 monitoring event. Leachate samples associated with compliance monitoring for off-site wastewater treatment are also obtained at the leachate storage tank when transport tanker trucks are being loaded. During 2021, approximately 15.2 million gallons of leachate were loaded into tanker trucks and transported from JRL for off-site treatment.

2021 Leachate Parameters that Fall Outside of Historical Range

Leachate parameter values during 2021 and historically since July 2013 are generally characterized by high concentrations. There were multiple parameters that were detected outside of their respective historical ranges during 2021 for LT-C4LR. The parameters with new historical maximum or minimum values at LT-C4LR in 2021 are summarized in Table 7-1.

TABLE 7-1

SUMMARY OF LT-C4LR PARAMETERS WITH NEW HISTORICAL MINIMUM OR MAXIMUM VALUES IN 2021

Parameter	Date	New Historical Minimum Value	New Historical Maximum Value
Dissolved oxygen (mg/L)	7/13/2021	0.5 (1.0)	-
Methylene Chloride (µg/L)	7/13/2021	1.0 U (1.2)	-
O-xylene (µg/L)	7/13/2021	-	8.0 (5.3)
M,p-xylene (µg/L)	4/6/2021 & 7/13/2021	-	13 (12)
Cis-1,2-dichloroethene (µg/L)	7/13/2021	-	2.5 (1.5)
Diethyl ether (µg/L)	7/13/2021	-	9.3 (8.0)
Beryllium (mg/L)	4/6/2021	-	0.0033 (0.0012)
Cadmium (mg/L)	4/6/2021	-	0.025 (0.0161)
Calcium (mg/L)	10/5/2021	200 (259)	-
Chromium (mg/L)	4/6/2021	-	0.13 (0.105)
Cobalt (mg/L)	4/6/2021	-	0.044 (0.034)
Copper (mg/L)	4/6/2021	-	0.093 (0.065)
Iron (mg/L)	10/5/2021	3.1 (3.5)	-
Magnesium (mg/L)	4/6/2021	170 (179)	-
Thallium (mg/L)	4/6/2021	-	0.025 (0.012)
Total suspended solids (mg/L)	10/5/2021	4.5 (5.0)	-
Hardness (mg/L)	4/6/2021	1,300 (1,400)	-
Turbidity (NTU)	10/5/2021	4.4 (6.1)	-

Notes:
Previous historical maximum and minimum values are shown in parentheses.
U = not detected above indicated laboratory reporting limit

2021 Leachate Key Indicator Parameters

The specific conductance values recorded at LT-C4LR in 2021 ranged from 17,300 µmhos/cm in April 2021 to 21,200 µmhos/cm in July 2021. Chloride concentrations at LT-C4LR in 2021 ranged from 4,800 mg/L in October 2021 to 9,900 mg/L in April 2021. Arsenic concentrations at LT-C4LR in 2021 ranged from 0.20 mg/L in April 2021 to 0.45 mg/L in October 2021. The 2021 data from the leachate monitoring location is included in Appendix D.

2021 Leachate Mann-Kendall Trends

There are not multiple (four or more) parameters for LT-C4LR with statistically significant increasing trends over the past three years or five years.

There are six parameters for LT-C4LR with statistically significant decreasing trends over the past three years, including dissolved oxygen, calcium, iron, total suspended solids, sulfate, and chloride. There are seven parameters for LT-C4LR with statistically significant decreasing trends over the past five years, including specific conductance, aluminum, iron, magnesium, biological oxygen demand, chloride, and cyanide.

2021 Leachate VOCs, SVOCs, Herbicides, Pesticides, and PCBs

Leachate was monitored for VOCs, SVOCs, herbicides, pesticides, and PCBs during the April 2021 monitoring event at LT-C4LR and for VOCs during the July 2021 and October 2021 monitoring events at LT-C4LR. Appendix D includes the monitoring results at LT-C4LR for 2021. The results of VOC, SVOC, herbicide, pesticide, and PCB parameters at LT-C4LR detected during 2021 at levels above their respective laboratory reporting limits are summarized below:

- Methylene chloride (1.1 µg/L in April 2021 and 1.9 µg/L in October 2021);
- Acetone (970 µg/L in April 2021, 800 µg/L in July 2021, and 450 µg/L in October 2021);
- Carbon disulfide (3.6 µg/L in July 2021);
- 1,2-dichloroethane (2.7 µg/L in April 2021 and 1.7 in October 2021);
- Methyl ethyl ketone (770 µg/L in April 2021, 660 µg/L in July 2021, and 340 µg/L in October 2021);
- Benzene (4.9 µg/L in April 2021, 5.5 µg/L in July 2021, and 3.7 µg/L in October 2021);
- 4-methyl-2-pentanone (33 µg/L in April 2021, 22 µg/L in July 2021, and 19 µg/L in October 2021);
- 2-hexanone (16 µg/L in April 2021);
- Toluene (24 µg/L in April 2021, 28 µg/L in July 2021, and 17 µg/L in October 2021);
- Ethylbenzene (10 µg/L in April 2021, 11 µg/L in July 2021, and 6.6 µg/L in October 2021);
- m,p-xylene (13 µg/L in April 2021, 13 µg/L in July 2021, and 8.5 µg/L in October 2021);
- o-xylene (6.9 µg/L in April 2021, 8.0 µg/L in July 2021, and 4.7 µg/L in October 2021);
- Tetrahydrofuran (320 µg/L in April 2021, 480 µg/L in July 2021, and 360 µg/L in October 2021);
- Cis-1,2-dichloroethene (2.2 µg/L in April 2021, 2.5 µg/L in July 2021, and 1.6 µg/L in October 2021);
- 1,4-dichlorobenzene (1.2 µg/L in April 2021 and 1.3 µg/L in July 2021);
- Diethyl ether (9.3 µg/L in July 2021 and 7.3 µg/L in October 2021);
- Phenol (200 µg/L in April 2021);
- Naphthalene (17 µg/L in April 2021);
- 3&4-methylphenol (320 µg/L in April 2021); and

- Acenaphthene (12 µg/L in April 2021).

The carbon disulfide detection at LT-C4LR in July 2021 at a concentration of 3.6 µg/L was a first-time detection above the laboratory reporting limit; however, the laboratory reporting limit has often been well above 3.6 µg/L for carbon disulfide historically at LT-C4LR. All other analyzed VOC and SVOC parameters shown above have previously been detected above laboratory reporting limits at LT-C4LR and/or LT-C4L (i.e., the former leachate collection location). There were no herbicides, pesticides, or PCBs parameters detected above the laboratory reporting limits in April 2021.

In contrast to leachate analytical data, there were no detections of the VOC parameters listed above in groundwater or underdrain samples obtained during 2021.[14]

2021 Leachate Bromide Concentrations Compared to Groundwater, Underdrain, Pore-Water, Surface Water, and Stormwater Bromide Concentrations

Bromide was present in the leachate (LT-C4LR) samples obtained during 2021 at concentrations ranging from 41 mg/L in October 2021 to 66 mg/L in April 2021. The chloride to bromide ratio for the leachate and site monitoring locations is being evaluated for its potential as a useful screening tool for assessing possible leachate influence in water samples obtained from site monitoring locations. The chloride to bromide ratios for the leachate during 2021 were approximately 150 to 1 in April 2021, 115 to 1 in July 2021, and 117 to 1 in October 2021.

While the ratio of chloride to bromide can be used to differentiate a variety of bromide sources,[15] the bromide concentrations in the JRL water quality sampling locations in 2021 were either non-detect or at low values. There were 115 bromide measurements during 2021 at 45 monitoring locations among the groundwater monitoring wells, underdrain monitoring locations, pore-water monitoring locations, surface water monitoring locations, and stormwater monitoring locations. Of the 115 bromide measurements during 2021, 82 of the measurements were non-detect with a laboratory reporting limit of 0.10 mg/L and six of the measurements were non-detect with laboratory reporting limits ranging from 0.20 mg/L to 0.50 mg/L.

There were 27 bromide measurements at 19 monitoring locations during 2021 among the groundwater, underdrain, pore-water, surface water, and stormwater monitoring locations with detections above the laboratory reporting limit. Among the 27 bromide detections during 2021, the concentrations ranged from 0.10 mg/L to 0.51 mg/L with a mean concentration of 0.18 mg/L.

---

[14] This excludes the detection of chloroform, a common laboratory contaminant, at a concentration of 1.4 µg/L in April 2021 at expansion landfill baseline monitoring location OW-609B.

[15] Panno, S.V., Hackley, K.C., Hwang, H.H., Greenberg, S.E., Krapac, I.G., Landsbergger, S., and O'Kelly, D.J., 2006, Characterization and identification of Na-Cl sources in ground water. Ground Water. 2006 Mar-Apr; 44(2):129.

Bromide detections at monitoring locations during 2021 were within their respective historical ranges with the following exceptions:

- Bromide exceeded previous historical maximum concentration of 0.23 mg/L at MW-401B in April 2021 with a concentration of 0.24 mg/L;
- Bromide exceeded previous historical maximum concentration of 0.22 mg/L at MW-502 in July 2021 with a concentration of 0.33 mg/L;
- Bromide exceeded previous historical maximum concentration of 0.24 mg/L at OW-601B in July 2021 with a concentration of 0.25 mg/L; and
- Bromide exceeded previous historical maximum concentration of 0.10 mg/L at P-206A in April 2021 with a concentration of 0.11 mg/L.

The 2021 bromide detections and chloride to bromide ratios are summarized in Table 7-2. The bromide concentrations above the laboratory reporting limits during 2021 are generally within the range of naturally occurring bromide concentrations in Maine, particularly in locations such as the JRL site that were in the area of post-glacial sea submergence.[16]

The chloride to bromide ratios summarized in Table 7-2 are broad ranging (i.e., from 4 to 1 to 350 to 1), with a median ratio of approximately 55 to 1. Only three of the 27 calculated chloride to bromide ratios fell within the same range as JRL leachate monitoring location LT-C4LR during 2021. The range of the chloride to bromide ratio results in 2021 is generally similar to those calculated for previous years.

The chloride concentrations associated with bromide detections were generally low and ranged from less than the laboratory reporting limit of 1.0 mg/L at MW-401B in April 2021 to 42 mg/L at OW-601B in July 2021. Only three of the 27 chloride concentrations associated with bromide detections during 2021 were at or above 25 mg/L and 15 of the 27 of the chloride concentrations were less than 10 mg/L.

Based on a study of 32 locations across 24 states in the United States, potable groundwater that has less than 10 mg/L chloride (which is a similar concentration range to most JRL sampling locations) had chloride to bromide ratios ranging from 43 to 1 to 285 to 1 with a median value of 101 to 1.[17] These values are

[16] Snow, M.S., Kahl, J.S., Norton, S.A., Olson, C., 1990. Geochemical determination of salinity sources in ground water wells in Maine. Proc., Focus Conference on Eastern Regional Ground Water Issues, Ground Water, Management No. 3, 1990, pp. 313-327.

[17] Davis, S.N., Fabryka-Martin, J.T., Wolfsberg, L.E., 2004. Variations of bromide in potable groundwater in the United States. Groundwater 42 (6), 902-909.

generally consistent with JRL leachate and for site monitoring locations where bromide was detected at low concentrations (see Table 7-2).

Unless site chloride concentrations become greater, the presence of bromide at low concentrations at some monitoring locations is currently of limited value for the chloride to bromide ratio analysis. However, this analysis is a helpful tool for future monitoring in the event that a monitoring location exhibits increasing concentrations for bromide and/or chloride and it should be maintained in the monitoring program.

TABLE 7-2

SUMMARY OF CHLORIDE TO BROMIDE RATIOS FOR 2021 BROMIDE DETECTIONS ABOVE LABORATORY REPORTING LIMITS

Location Designation	Date	Chloride Concentration (mg/L)	Bromide Concentration (mg/L)	Chloride to Bromide Ratio
LT-C4LR	April 2021	9,900	66	150:1
	July 2021	6,800	59	115:1
	October 2021	4,800	41	117:1
LF-LD-5and6	April 2021	2.1	0.14	15:1
	October 2021	2.3	0.10	23:1
LP-UD-2	April 2021	6.2	0.11	56:1
MW04-109R	April 2021	3.6	0.20	18:1
	July 2021	4.2	0.20	21:1

SW-1	October 2021	8.3	0.13	64:1

Note:
U = not detected above indicated laboratory reporting limit

7.2 Underdrains

The JRL underdrain monitoring locations for the landfill and former leachate pond are listed in Table 7-3. Where there was flow during 2021 from underdrain monitoring locations, the underdrain monitoring data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems.

There was no flow at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 during any of the three 2021 monitoring events; thus, no samples were obtained at these locations during 2021. LP-UD-1 was monitored by NEWSME during the September and October monthly monitoring events for field parameters only. 2021 occurrences of no flow at these underdrain monitoring locations are generally consistent with previous observed patterns with the exception of LF-UD-2. The decrease in flow from LF-UD-2 is likely associated with the lowering of the groundwater table that has resulted from the construction of the landfill expansion cells (see Section 1.2).

Sample pipe submergence conditions did not occur for the LF-COMP and LP-COMP sampling locations during the three 2021 monitoring events for field parameters and the detection monitoring analytical parameters, so those locations did not require sampling. While it was not required, sampling for detection monitoring parameters was done at LF-COMP during the April 2021 monitoring event due to a communication error. There was no flow from any of the inlet pipes (i.e., LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7) during the April 2021 monitoring event, which is not typical. The April 2021 detection monitoring results from LF-COMP do not represent water quality during a time when LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7 could not be sampled separately due to pipe invert submergence.

LF-COMP and LP-COMP samples were obtained and analyzed by NEWSME for field parameters during each month of 2021.

Comparison of Key Indicator Parameters at Underdrains to JRL Leachate and Summary of Statistically Significant Trend Results

The 2021 annual maximum specific conductance values and chloride and arsenic concentrations for underdrain monitoring locations are summarized in Table 7-3. The Mann-Kendall analyses results for statistically significant trends for these parameters are also provided in Table 7-3. The complete results for Mann-Kendall analyses are provided in Appendix F.

TABLE 7-3

2021 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT UNDERDRAIN MONITORING LOCATIONS

Location Designation	Annual Maximum Specific Conductance (21,200 µmhos/cm in JRL Leachate in July 2021)			Annual Maximum Chloride (9,900 mg/L in JRL Leachate in April 2021)			Annual Maximum Arsenic (0.45 mg/L in JRL Leachate in October 2021)		
	µmhos/cm	Statistically Significant Trend		mg/L	Statistically Significant Trend		mg/L	Statistically Significant Trend	
		3-Year	5-Year		3-Year	5-Year		3-Year	5-Year
LF-COMP	504	–	–	2.1	I	I	0.005 U	I	I
LF-UD-1	NS	I	I	NS	I	I	NS	I	I
LF-UD-2	NS	I	I	NS	I	I	NS	I	I
LF-UD-3A,B	NS	I	I	NS	I	I	NS	I	I
LF-UD-4	343	–	–	1.3	I	–	0.005	I	–
LF-UD-5and6	450	–	–	2.6	Increasing	–	0.005 U	–	–
LF-UD-6	1,365	Increasing	Decreasing	18	–	–	0.011	–	–
LF-UD-7	NS	I	I	NS	I	I	NS	I	I
LF-UD-8	NS	I	I	NS	I	I	NS	I	I
LF-UD-9	NS	I	I	NS	I	I	NS	I	I
LF-UD-10	NS	I	I	NS	I	I	NS	I	I
LP-COMP	365	–	–	NS	I	I	NS	I	I
LP-UD-1	357	I	I	NS	I	I	NS	I	I
LP-UD-2	344	–	Decreasing	6.2	Increasing	–	0.005 U	–	–

Notes:
U = not detected above indicated laboratory reporting limit
NS = not sampled in 2021
– = no trend
I = insufficient data

Annual maximum specific conductance values during 2021 from LF-UD-4, LF-UD-5and6, LP-COMP, LP-UD-1, and LP-UD-2 ranged from 343 µmhos/cm to 450 µmhos/cm and were low relative to the JRL leachate (specific conductance values ranged from 17,300 µmhos/cm in April 2021 to 21,200 µmhos/cm in July 2021 at LT-C4LR). The greatest specific conductance value measured during 2021 was at LF-UD-6 (1,365 µmhos/cm in August 2021), which is greater than the previous historical maximum value of 919 µmhos/cm measured in August 2013. Specific conductance was measured at a lower value of 295 µmhos/cm later in the year (October 2021) at LF-UD-6 and there is currently a five-year statistically significant decreasing trend for specific conductance at LF-UD-6. The 2021 annual maximum LF-UD-6 chloride concentration (18 mg/L) and arsenic concentration (less than the laboratory reporting limit of 0.005 mg/L) remain low and are not indicative of influence from the JRL leachate.

During 2021, chloride concentrations from the sampled underdrain monitoring locations were low relative to the JRL leachate (chloride was detected in leachate at a concentration of 9,900 mg/L at LT-C4LR in April 2021) and do not indicate influence from the presence of landfill leachate.

The arsenic concentrations in the underdrain monitoring locations sampled during 2021 were low and generally consistent with those at groundwater monitoring wells across the site, including multiple upgradient monitoring locations.

There are insufficient data for three-year and five-year Mann-Kendall analyses at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 due to those locations being always or intermittently dry during sampling events. For underdrain monitoring locations with sufficient data for analysis, the Mann-Kendall trend analyses for the key indicator parameters (i.e., specific conductance, chloride, and arsenic) indicate generally improving or stable water quality conditions. Underdrain monitoring locations LF-UD-6 and LP-UD-2 have five-year statistically significant decreasing trends for specific conductance. Underdrain monitoring location LF-UD-6 also has a three-year statistically significant increasing trend for specific conductance.

There are not statistically significant trends for specific conductance at LF-COMP, LF-UD-4, LF-UD-5and6, and LP-COMP over the past three years and five years.

There are three-year statistically significant increasing trends for chloride at LF-UD-5and6 and LF-UD-2; however, annual maximum chloride concentrations at these locations remain very low (2.6 mg/L and 6.2 mg/L, respectively). There were no statistically significant trends for arsenic over the past three years or five years at underdrain monitoring locations with sufficient data for analyses.

Of the underdrain monitoring locations with sufficient data for Mann-Kendall trend analyses, LP-UD-2 was the only underdrain monitoring location with multiple (i.e., four or more) three-year and/or five-year statistically significant increasing and/or decreasing trends: Calcium, total dissolved solids, bicarbonate, alkalinity, and chloride have statistically significant increasing trends over the past three years. These parameters were well within their respective historical ranges at LP-UD-2 during 2021 and only moderately greater than at upgradient monitoring wells MW-206 and P-206A.

The complete results of the Mann-Kendall analyses are included in Appendix F.

2021 Underdrain VOCs

VOCs were analyzed at all sampled underdrain locations (both landfill and former leachate pond underdrains) in April 2021. There were no VOCs detected in 2021 above laboratory reporting limits at any of the sampled underdrain locations.

7.3 Groundwater Quality

During 2021, routine water quality samples were obtained from 36 detection monitoring well locations (unless those locations were dry) at the JRL during April, July, and October 2021.[18,19] With few exceptions, historical water quality data from groundwater monitoring locations at the JRL are consistent with their setting, the groundwater flow conditions at the monitoring locations, and normal construction and operational activities of the landfill. Site groundwater data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The 2021 water quality data remain consistent with these interpretations.

Comparison of Key Indicator Parameters at Groundwater Monitoring Locations to JRL Leachate and Summary of Statistically Significant Trend Results

A summary of site-wide groundwater quality in 2021 at the JRL is provided in Table 7-4. The table contains a comparison of 2021 values of key indicator parameters (i.e., specific conductance, chloride, and arsenic) from leachate monitoring location LT-C4LR to the site's 36 groundwater monitoring locations and current statistically significant trends of the key indicator parameters. The table also includes a summary of locations identified with statistically significant trends for multiple (i.e., four or more) parameters. The complete results of the Mann-Kendall trend analyses are provided in Appendix F. The groundwater monitoring locations shown in Table 7-4 are listed in order of 2021 annual maximum specific conductance values from high to low.

[18] See footnotes 9, 10, and 11 from Section 2.1.
[19] OW-603B was dry during its 2021 monitoring events.

TABLE 7-4

2021 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT GROUNDWATER MONITORING LOCATIONS

Location Designation	Position Relative to Landfill	Material Screened	Annual Maximum Specific Conductance (21,200 µmhos/cm in JRL Leachate in July 2021)			Annual Maximum Chloride (9,900 mg/L in JRL Leachate in April 2021)			Annual Maximum Arsenic (0.45 mg/L in JRL Leachate in October 2021)			Multiple Parameters with Decreasing Trends [1]		Multiple Parameters with Increasing Trends [1]	
			µmhos/cm	Statistically Significant Trend		mg/L	Statistically Significant Trend		mg/L	Statistically Significant Trend

Notes:

1. Number of parameters with trends shown in parenthesis for analyses with four or more trends. Locations monitored for field parameters only (i.e., DP-4, MW04-105, MW-204) are not assessed for multiple (i.e., four or more) parameters.
2. Locations shown with non-bold text have water quality that: (1) does not indicate influence from landfill leachate; and (2) shows limited influence from landfill construction operations. Locations shown with bold text currently have more pronounced water quality changes that are largely attributable to changes in redox conditions related to construction of the landfill and/or landfill operations, and do not indicate significant landfill related impacts to water quality from malfunction of landfill liners. Section 7.3 includes extended discussions for the locations shown with bold text.
3. Insufficient data for detection monitoring parameters (i.e., trends available for field parameters only).

U = not detected above indicated laboratory reporting limit
NS = not sampled in 2021
– = no trend
I = insufficient data

Arsenic concentrations site-wide are generally low and did not exceed the MCL and MEG of 0.01 mg/L at 29 of the 32 monitoring locations where arsenic was sampled in 2021. At the three groundwater monitoring locations where arsenic did exceed the MCL and MEG, MW-227, MW-402A, and MW-402B, arsenic concentrations were only detected as high as 0.021 mg/L (at MW-402B in October 2021). The noted exceedances did not occur in conjunction with elevated or increasing chloride concentrations (see Table 7-4).

Based on review of Table 7-4 and a visual review of plotted 2021 and historical data, SME has identified 24 of the 36 site-wide groundwater monitoring locations with water quality that: (1) do not indicate influence from landfill leachate; and (2) currently show limited influence from landfill construction operations. These 24 groundwater monitoring locations are identified on Table 7-4 as the locations with non-bold text. The 2021 annual maximum specific conductance values at these wells range from 111 µmhos/cm to 424 µmhos/cm. The 2021 annual maximum chloride concentrations at these monitoring locations were very low and ranged from 1.3 mg/L to 16 mg/L. These wells also exhibit limited to no statistically significant increasing trends. For these reasons, extended discussion on these wells is not warranted at this time.

More pronounced water quality changes have been observed at multiple groundwater monitoring locations, both upgradient and downgradient from the landfill. These changes are evidenced at some monitoring locations by the statistically significant trends, as summarized in Table 7-4, for multiple parameters. These trends are largely attributable to landfill operations and changes in redox conditions, which occur as expected around the landfill due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.

SME has identified 12 of the site monitoring locations that currently warrant additional discussions. These monitoring locations, shown by bold text in Table 7-4, are: (1) upgradient monitoring locations MW12-303R and P-206A; (2) downgradient monitoring locations MW-223A, MW223B, MW-301, and MW-302R; and (3) OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507, which are downgradient from the landfill expansion. Groundwater quality at these monitoring locations is discussed below.

<u>Extended Discussion on JRL Groundwater Quality</u>

<u>Upgradient Monitoring Locations MW12-303R and P-206A</u>: Groundwater monitoring locations MW12-303R and P-206A are categorized as upgradient from the JRL; however, as the east side of the JRL (i.e., the upslope edge) is situated along the crest of a northwest-southeast trending drumlin, these upgradient monitoring locations are not fully hydraulically isolated from the landfill and operations outside of the area of landfill construction (see interpreted phreatic surface and groundwater potentiometric surface maps in Appendix B).

P-206A is a bedrock piezometer located southeast from the landfill and outside of the area of landfill construction. P-206A was added to the monitoring program during the July 2013 sampling event to provide an additional upgradient bedrock monitoring location. Review of the water quality data at P-206A shows that there were increases for several parameters over the past several years at P-206A; however, the groundwater quality at P-206A is still characterized by low parameter concentrations. The Mann-Kendall analyses indicate that there are statistically significant increasing trends for four parameters at P-206A for the past three years (specific conductance, magnesium, bicarbonate, and nitrate plus nitrite) and for seven parameters over the past five years (specific conductance, calcium, magnesium, total dissolved solids, sulfate, bicarbonate, and nitrate plus nitrite). The 2021 annual maximum values for parameters identified with current or recent increasing trends are shown below:

- Specific conductance (249 µmhos/cm in October 2021);
- Calcium (26 mg/L in October 2021);
- Magnesium (8.2 mg/L in October 2021);
- Total dissolved solids (149 mg/L in October 2021);
- Sulfate (3.2 mg/L in April 2021 and October 2021);
- Bicarbonate (88 mg/L in April 2021); and
- Nitrate plus nitrite (0.58 mg/L in October 2021).

While these parameters have exhibited increases over the past several years, their 2021 values remain relatively low and consistent with expectations in their site setting. Chloride concentrations are currently stable at P-206A with no statistical increasing or decreasing trend over the past three years and five years. The annual maximum chloride concentration at P-206A during 2021 was 23 mg/L (July 2021 and October 2021). There were no MCL and/or MEG exceedances for parameters analyzed at P-206A during 2021.

There were new historical maximum values detected for calcium, magnesium, total dissolved solids, bicarbonate, and bromide at P-206A during 2021. There were new historical minimum values detected for pH, iron, manganese, potassium, and sodium at P-206A during 2021.

The Mann-Kendall analyses indicate that there are not statistically significant decreasing trends for multiple parameters (i.e., four or more) at P-206A for the past three-year and five-year periods.

Since groundwater quality at P-206A is still characterized by low parameter concentrations and the increasing water quality trends appear to be subsiding, SME does not interpret the current water quality at P-206A as related to the performance of landfill cells or leachate collection and transport systems. Monitoring location P-206A is located proximate to the looped road that accesses the JRL leachate storage tank. SME recommends that on-site snow removal and winter roadway maintenance practices minimize stockpiling of snow around this well.

MW12-303R is located in an area that historically has been influenced by roadway maintenance and runoff and from site construction activities. Water quality at MW12-303R was generally consistent with that at upgradient well MW-206 from when it was first sampled in 2012 until between 2015 and 2016. Since that time, multiple water quality parameters at MW12-303R have increased. Previous investigations were conducted to assess three ancillary landfill structures related to landfill leachate and gas condensate in the vicinity of the well as potential sources responsible for the change in water quality at MW12-303R, and results are discussed in previous annual water quality reports.[20] Investigation results identified that the water quality at MW12-303R was not associated with these three structures.

Visual inspection of the area surrounding the well in 2018 showed the well was located in a topographic depression and that it is located near the beginning of the access road to Cell 10, which began receiving waste in October 2017. It is likely that stormwater runoff from the vicinity of the access road had contributed to the water quality changes at MW12-303R. It was also determined that plowed snow was piled in the area surrounding MW12-303R during the winter of 2018 and during previous years.

The water quality signature at MW12-303R and the timing of the April 2018 monitoring event was consistent with what would be anticipated from impacts associated with surface water. Increases in dissolved oxygen and sulfate concentrations (see Appendix E) in this well suggest that MW12-303R was being influenced by an oxygenated source such as stormwater from precipitation, runoff, and/or spring snow melting. In early summer of 2018, the access roadway and the area surrounding MW12-303R were regraded to divert stormwater runoff away from the well and the well was purged.

In general, the recent water quality parameter value increases observed at MW12-303R appear to be stabilizing or improving. While there were seven parameters identified with statistically significant increasing trends for data from 2013 through 2017, including specific conductance and chloride, chloride is the only water quality parameter for the past three years with a statistically significant increasing trend and there are none over the past five years. There are not statistically significant decreasing trends for multiple parameters (i.e., four or more) over the past three years or five years at MW12-303R. There are statistically significant decreasing trends for groundwater at MW12-303R over the pasts three years and five years, which suggests less infiltration of water in the area of MW12-303R over the past several years.

There was only one parameter (pH) at MW12-303R that was outside of its historical range. The pH value at MW12-303R was 5.7 in April 2021, which is less than the previous historical minimum value of 5.8.

[20] SME, August 2015, Juniper Ridge Landfill, June 2015 Supplemental Water Quality Data and July 2015 Water Quality Data Results.

Specific conductance, chloride, and arsenic values at MW12-303R have declined substantially since they were recently reported at historical maximum values, which are shown in Table 7-5.

TABLE 7-5

SUMMARY OF 2021 KEY INDICATOR PARAMETER VALUES AT MW12-303R

Parameter	October 2012 Value	Historical Maximum Value	2021 Range of Values
Specific Conductance (µmhos/cm)	189	1,711 (April 2018)	442 (April 2021) to 673 (October 2021)
Chloride (mg/L)	4.9	220 (April 2018)	59 (April 2021) to 110 (October 2021)
Arsenic (mg/L)	0.005 U	0.036 mg/L (July 2016)	0.005 U (April, July, October 2021)

Note:
U = not detected above indicated laboratory reporting limit

The specific conductance values and chloride concentrations at MW12-303R during 2021, while lower than the historical maximum values reported in April 2018, rebounded somewhat compared to during 2020. This may be associated with precipitation totals being well over normal values in the months of or just before the summer and fall monitoring events. The precipitation totals reported by the NCDC for Bangor, Maine in July 2021 (7.67 inches) and September 2021 (9.42 inches) were above normal precipitation of 4.51 inches and 5.66 inches, respectively.

Sodium exceeded its MEG of 20 mg/L at MW12-303R in April 2021 (22 mg/L), July 2021 (28 mg/L), and October 2021 (37 mg/L). The nitrate plus nitrite concentrations in April 2021 (1.9 mg/L) and July 2021 (3.8 mg/L) indicate that the 10 mg/L MCL and MEG for nitrate was not exceeded; however, while unlikely, it cannot be distinguished whether the 1 mg/L MCL and MEG for nitrite was exceeded. There were no other parameters analyzed at MW12-303R with MCL and/or MEG exceedances in 2021.

SME does not interpret the recent water quality trends at MW12-303R and P-206A as related to the performance of landfill cells or leachate collection and transport systems. This is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations (see Section 7.2).

<u>Downgradient Monitoring Locations MW-223A, MW-223B, MW-302R:</u> Groundwater monitoring wells MW-223A and MW223B monitor the bedrock and overburden groundwater, respectively, hydraulically downgradient and northwest of the JRL. Bedrock groundwater monitoring location MW-302R is located northwest from the JRL. Monitoring well MW-302R is located directly adjacent to one of the site's stormwater Detention Pond #5.

In previous years' site water quality evaluations, SME has specifically addressed monitoring wells MW-302R, MW-223A, and MW-223B, located along the northwest perimeter of the landfill, and potential site activities responsible for the water quality in these wells.[21,22] Additional insight into the water quality changes at these wells was discussed in the 2016 through 2020 site water quality evaluations, with the sampling of the Scale House Well and Office Well during those years. The evaluation determined that similarities exist among the Scale House Well, the Office Well, MW-302R, MW-223A, and MW-223B, and showed that they are distinct from the chemical signature of the leachate from LT-C4LR. The similarities in water quality in these wells are consistent with the known hydrogeology in this area of the site. Bedrock pumping tests completed between March 17, 2009 and March 19, 2009 at pumping well PW-08-02,[23] located proximate to the Scale House Well, showed preferential drawdown patterns in the surrounding wells that demonstrated a preferential groundwater flow direction exists from northeast to southwest from the vicinity of the Scale House (i.e., in the direction from the Scale House Well toward MW-302R, MW-223A, and MW-223B). This suggests that water quality in MW-302R, MW-223A, and MW-223B may in part be associated with upgradient water quality in the vicinity of the Office Well and Scale House Well in addition to the sources previously identified. A former topsoil and stump stockpile area and a subsurface wastewater disposal field are also located along this preferential groundwater flow direction. As part of the landfill expansion construction, the Office Well was decommissioned in 2020. The Scale House Well was decommissioned in 2021 with a vibrating wire piezometer installed in it.

Table 7-6 summarizes the 2021 annual maximum water quality parameter results for eight parameters at MW-302R, MW-223A, and MW-223B that are elevated with respect to upgradient groundwater quality. Arsenic concentrations at MW-302R, MW-223A, and MW-223B were not elevated with respect to upgradient groundwater quality but arsenic is included in Table 7-6 since it is a key indicator parameter for comparison to JRL leachate.

[21] SME, April 2015. 2014 Annual Water Quality Report, Juniper Ridge Landfill, prepared for NEWSME Landfill Operations LLC.

[22] SME, April 2016, 2015 Annual Water Quality Report, Juniper Ridge Landfill, prepared for NEWSME Landfill Operations LLC.

[23] SME, May 13, 2016, Letter to MEDEP regarding Juniper Ridge Landfill Expansion Application, MEDEP #S-020700WD-BI-N, follow-up to Department Staff's responses to the March 4, 2016 submittal on Staff's review comments as presented in the Department's April 5, 2016 letter (Attachment SME-D3, Figures U-14B- Bedrock Amended and Figure U-14B- Till Amended).

TABLE 7-6

SUMMARY OF 2021 ANNUAL MAXIMUM WATER QUALITY PARAMETER VALUES AT MW-302R, MW-223A, AND MW-223B

Parameter	MW-302R	MW-223A	MW-223B	Upgradient Comparison (MW-206)
Specific Conductance (µmhos/cm)	662	628	531	159
Arsenic (mg/L)	0.006	0.005 U	0.005	0.009
Calcium (mg/L)	59	110	71	18
Magnesium (mg/L)	5.2	11	16	5.3
Sodium (mg/L)	28	6.2	5.7	4.6
Total Dissolved Solids (mg/L)	328	387	340	95
Sulfate (mg/L)	31	21	16	2.3
Bicarbonate (mg/L)	140	260	200	70
Chloride (mg/L)	68	32	38	2.8

Note:
U – not detected above the indicated laboratory reporting limit

Piper and Stiff diagrams were plotted using April 2021 data for MW-302R, MW-223A, MW-223B, upgradient monitoring well MW-206, and the leachate sampled at LT-C4LR. The Piper and Stiff diagrams for these locations, which are provided in Appendix G, show similar chemical signatures for MW-223A, MW-223B, MW-302R, and MW-206 and a clear distinction from the chemical signature of the leachate from LT-C4LR.

The water quality at MW-302R is characterized by a relatively large seasonal variation in parameter values, including groundwater levels. The groundwater levels are influenced by stormwater levels in adjacent Detention Pond #5. There is typically a correlation between low groundwater level elevations and low dissolved oxygen concentrations, when MW-302R is less influenced by stormwater from Detention Pond #5, and higher values for multiple parameters (see box and whisker plots in Appendix E). During these periods, the higher parameter concentrations at MW-302R are more characteristic of past upgradient water quality at the former Scale House Well and former Office Well.

Nitrate plus nitrite and organic carbon were the only parameters analyzed at MW-302R with new historical maximum values in 2021. The organic carbon concentration in July 2021 at MW-302R (64 mg/L) is anomalously higher than the previous historical maximum value of 24 mg/L, the latter of which was reported in October 2020 and was flagged as likely elevated due to an identified laboratory instrumentation malfunction. Besides these two anomalously high organic carbon concentrations reported for MW-302R, organic carbon concentrations have been below the laboratory reporting limit of 2.0 mg/L for at least the past ten years, including during the April 2021 and October 2021 monitoring events. The nitrate plus nitrate concentration in October 2021 (1.0 mg/L) exceeded its previous historical maximum value of 0.73 mg/L. There are statistically significant increasing trends at MW-302R for six parameters (specific conductance, calcium, magnesium, potassium, bicarbonate, and nitrate plus nitrate) over the past three years. There are not statistically significant decreasing trends at MW-302R for multiple parameters (i.e., four or more) over the past three years or five years or increasing trends for multiple parameters (i.e., four or more) over the past five years.

Visual review of water quality trends at MW-223A and MW-223B show distinct increases in parameter concentrations since about 2005 or later. There are statistically significant increasing trends at MW-223A for six parameters (specific conductance, calcium, magnesium, total dissolved solids, sulfate, and bicarbonate) over the past three years and seven parameters (specific conductance, calcium, magnesium, sodium, total dissolved solids, sulfate, and bicarbonate) over the past five years. There are statistically significant decreasing trends for four parameters (pH, Eh, dissolved oxygen, and chloride) at MW-223A over the past five years.

There are statistically significant increasing trends at MW-223B for five parameters (specific conductance, iron, total dissolved solids, sulfate, and bicarbonate) over the past three years and for eight parameters (specific conductance, calcium, iron, magnesium, potassium, total dissolved solids, sulfate, and bicarbonate) over the past five years. There are not statistically significant decreasing trends for multiple parameters (i.e., four or more) at MW-223B over the past three years or five years.

Previous increasing concentrations of chloride have generally been decreasing over the past five years at MW-223A and have generally been stable over the past five years at MW-223B.

There were three groundwater quality parameters detected at new historical maximum values at MW-223A in 2021: calcium (110 mg/L in October 2021), total dissolved solids (387 mg/L in October 2021), and bicarbonate (260 mg/L in April 2021 and October 2021). There were three groundwater quality parameters detected at new historical maximum values at MW-223B in 2021: calcium (71 mg/L in July 2021 and October 2021), total dissolved solids (340 mg/L in October 2021), and bicarbonate (200 mg/L in April 2021, July 2021, and October 2021).

There were no MCL or MEG exceedances of analyzed parameters at MW-223A and MW-223B in 2021. Sodium exceeded its MEG of 20 mg/L at MW-302R in July 2020 (28 mg/L) and October 2020 (24 mg/L). Sodium has previously exceeded its MEG at MW-302R. There were no other MCL or MEG exceedances of analyzed parameters at MW-302R in 2021.

We do not interpret recent water quality and noted trends at MW-223A, MW-223B, and MW-302R as related to the performance of landfill cells or leachate collection and transport systems. This is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations (see Section 7.2).

Downgradient location MW-301: MW-301 is a deep bedrock monitoring well (screened between 162.7 and 182.7 feet below ground surface) located downgradient from the landfill in proximity of the former leachate pond. The groundwater quality at MW-301 is consistent with its setting as a monitoring location downgradient from the landfill. There are no current concerns with water quality results at this location related to the performance of landfill cells or leachate collection and transport systems.

There were no parameters analyzed at MW-301 that exceeded MCL or MEG standards in 2021. Although parameter concentrations at MW-301 remained relatively low during 2021, the Mann-Kendall analyses indicate that there are five parameters (specific conductance, manganese, sodium, total dissolved solids, and chloride) at MW-301 with statistically significant increasing trends for the past five years. Review of the 2021 data for these parameters shows that their values are steadily increasing. The specific conductance values at MW-301 range from 239 µmhos/cm to 259 µmhos/cm during 2021, remaining generally consistent with those at upgradient monitoring location MW-206, which has a historical maximum value of 269 µmhos/cm (April 2018). Chloride concentrations at MW-301 increased relatively sharply between about 2013 through 2019 but have remained stable from 2019 through 2021. While the 2013 chloride concentrations at MW-301 were 2.3 mg/L (July 2013) and 3.1 mg/L (October 2013), the annual maximum chloride concentration was 26 mg/L in April 2021.

There were new historical maximum concentrations at MW-301 during 2021 for magnesium (7.1 mg/L in April 2021), total dissolved solids (171 mg/L in April 2021), and organic carbon (16 mg/L in July 2021).

Review of water quality data at MW-301 suggests that there may be a correlation between the noted parameter value increases and a repair of the well in 2013. MW-301 was reported damaged in April 2013 and was not sampled. Following repairs to MW-301 (prior to the July 2013 monitoring event), there was a distinct increase in reported groundwater elevations at MW-301 in the order of approximately 4 feet. Since the repairs, multiple parameters began to increase at MW-301. The parameters with the most evident changes starting in 2013 are specific conductance, calcium, magnesium, sodium, and chloride.

Landfill Expansion downgradient locations OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507: Monitoring locations OW-06-03, OW-601A, and OW-601B are located east of the landfill expansion and downgradient from Cell 11. Monitoring location 606A is located east of the landfill expansion and downgradient from Cell 12. Monitoring locations OW-611A and MW-507 are located west of and downgradient from the landfill expansion. Baseline groundwater quality was monitored at these locations in 2018. Detection monitoring began at OW-06-03, OW-601A, and OW-601B in 2019 and at OW-606A, OW-611A, and MW-507 in 2021.

Chloride concentrations at monitoring locations OW-601A, OW-601B, OW-606A, OW-611A, and MW-507 are somewhat greater than at monitoring locations upgradient from the JRL. Detection monitoring parameters are sampled and analyzed only during the summer (i.e., July 2021) OW-601A and OW-601B. The July 2021 chloride concentrations at OW-601A and OW-601B were 22 mg/L and 42 mg/L, respectively.

Monitoring locations OW-606A, OW-611A, and MW-507 were sampled in July 2021 and October 2021 with annual maximum chloride concentrations of 37 mg/L, 48 mg/L, and 43 mg/L, respectively.

Specific conductance values at OW-601A, OW-601B, OW-606A, OW-611A, and MW-507 during 2021 were somewhat greater than at upgradient monitoring locations MW-206 and P-206A, which is generally consistent with other groundwater monitoring locations downgradient from the JRL. The annual maximum specific conductance values at these locations during 2021 ranged from 290 µmhos/cm at OW-606A in July 2021 to 496 µmhos/cm at OW-611A in July 2021.

Specific conductance values measured at OW-06-03 have increased since it was first sampled in April 2018 (193 µmhos/cm) to 2021 (1,035 µmhos/cm in October 2021). The chloride concentration, however, remains very low at OW-06-03 (6.3 mg/L in July 2021).

Arsenic was not detected above the laboratory reporting limit of 0.005 mg/L at OW-606A, OW-611A, and MW-507 during 2021. Arsenic was detected at low concentrations that did not exceed the MCL and MEG of 0.01 mg/L during 2021 at OW-06-03 (0.010 mg/L in July 2021), OW-601A (0.005 mg/L in July 2021), and OW-601B (0.006 mg/L in July 2021).

There is insufficient groundwater quality data for performing Mann-Kendall trend analyses at OW-606A, OW-611A, and MW-507 over the past three years and five years. For OW-06-03, OW-601A, and OW-601B there is only sufficient data for three-year Mann-Kendall analyses for field parameters. Specific conductance has a three-year statistically significant increasing trend at OW-06-03 and no trend at OW-601A and OW-601B.

There were no MCL exceedances for parameters analyzed at OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507 during 2021. The only MEG exceedances for parameters analyzed at these locations were iron at OW-06-03 (23 mg/L in July 2021) and manganese (8.7 mg/L in July 2021) at OW-06-03.

Monitoring locations OW-06-03, OW-601A, OW-601B, and OW-606A are located in close proximity to the landfill access road and may be influenced by winter road salting. Additionally, OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and ME-507 are likely influenced by the recent construction of the Cell 11, Cell 12, and/or Cell 13 liner systems. Additional monitoring data from these locations over time will be useful for evaluating groundwater quality influences from the construction of the landfill expansion cells.

Of note is that OW-611A is located proximate to MW-223A and MW-223B, which are discussed above regarding the similarities that exist between their water quality and the water quality for monitoring wells (former and current) along a preferential groundwater flow direction that exists from northeast to southwest. Several of the groundwater monitoring locations downgradient from the landfill expansions are located along this preferential groundwater flow direction. Stiff diagrams were plotted using July 2021 data for landfill expansion downgradient monitoring wells OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507, which are provided in Appendix H. These Stiff diagrams show similar chemical distinctions to those of MW-223A, MW-223B, MW-302R, and the former Scale House and Office wells and a clear distinction from the chemical signature of the leachate from LT-C4LR (see Appendix G).

VOCs at JRL Groundwater Monitoring Well Locations

VOCs were analyzed at MW-401B in April 2021. No VOCs were detected above the laboratory reporting limits at MW-401B in 2021.[24]

MCL and MEG Exceedances at JRL Groundwater Monitoring Well Locations

Parameters detected at concentrations that were above MCLs or MEGs at groundwater detection monitoring locations in 2021 are identified in Table 7-7.[25]

TABLE 7-7

2021 MCL AND MEG EXCEEDANCES AT GROUNDWATER MONITORING LOCATIONS

Location Designation	Iron (mg/L) (5 mg/L MEG)	Manganese (mg/L) (0.3 mg/L MEG)	Sodium (mg/L) (20 mg/L MEG)	Arsenic (mg/L) (0.01 mg/L MCL and MEG)
MW-04-09A	–	0.33 (October 2021)	45 (July 2021) 37 (October 2021)	–
MW04-109R	–	0.97 (July 2021) 1.4 (October 2021)	–	–
MW-227	–	–	–	0.013 (April 2021) 0.012 (July 2021) 0.015 (October 2021)
MW12-303R	–	–	22 (April 2021) 28 (July 2021) 37 (October 2021)	–
MW-302R	–	–	28 (July 2021) 24 (October 2021)	–
MW-402A	–	–	–	0.017 (April 2021) 0.015 (July 2021) 0.019 (October 2021)
MW-402B	–	–	–	0.018 (April 2021) 0.019 (July 2021) 0.021 (October 2021)
OW-06-03	23 (July 2021)	8.7 (July 2021)	–	–
P-04-02R		–	35 (April 2021) 34 (July 2021) 29 (October 2021)	–

[24] See Section 7.5 for VOC analyses completed for 2021 baseline monitoring.
[25] See Section 7.5 for MCL and MEG exceedances for 2021 baseline monitoring locations.

With the exception of the iron MEG exceedance in 2021 at OW-06-03, which has previously only been sampled for iron once in 2018, each of the MCL and/or MEG exceedances listed in Table 7-7 have occurred at their respective locations in the past. The occurrence of arsenic MCL and MEG exceedances in groundwater is largely attributable to reducing conditions associated with landfill operations and decreasing groundwater recharge from site development. They are not interpreted to be related to landfill liner system performance.

Dissolved Methane

Samples were obtained for dissolved methane analysis at monitoring wells MW-223B and MW-501 during the April, July, and October 2021 monitoring rounds. Dissolved methane was not detected above the laboratory reporting limit of 20 µg/L at MW-223B and MW-501 in April, July, and October 2021.

Samples were obtained for dissolved methane analysis at monitoring wells MW-04-09A, MW-04-09B, MW-206, MW-502, MW-507, OW-606A, OW-608A, and OW-611A during the July 2021 and October 2021 monitoring rounds. Dissolved methane was not detected above the laboratory reporting limit of 20 µg/L at MW-04-09A, MW-04-09B, MW-206, MW-507, OW-606A, and OW-611A in July 2021 and October 2021. Dissolved methane was detected at MW-502 at low concentrations of 190 µg/L in July 2021 and 37 µg/L in October 2021. Dissolved methane was detected at OW-608A at a low concentration of 140 µg/L in October 2021 but was not detected above the laboratory reporting limit of 20 µg/L in July 2021. Dissolved methane samples were not collected from OW-603B during 2021 because that location was dry in July 2021 and October 2021.

Samples were obtained for dissolved methane analysis at monitoring wells MW06-01, OW-06-03, OW-601A, OW-601B, OW-602A, OW-604A, and P-206A during the July 2021 monitoring round. Dissolved methane was not detected above the laboratory reporting limit of 20 µg/L at MW06-01, OW-601A, OW-601B, OW-604A and P-206A in July 2021. Dissolved methane was detected at a low concentration of 41 µg/L at OW-602A in July 2021. Dissolved methane was detected at a concentration of 2,900 µg/L at OW-06-03 in July 2021.

While the dissolved methane concertation of 2,900 µg/L at OW-06-03 in July 2021 is notable in terms of potential migration of landfill gas, there is no historical dissolved methane data at OW-06-03 prior to July 2021. Monitoring well OW-06-03 is located proximate to OW-604A, where dissolved methane was not detected above the laboratory reporting limit of 20 µg/L in July 2021, and is screened at a similar depth interval in the bedrock as OW-604A. The 2022 dissolved methane monitoring at OW-06-03 and its proximate monitoring wells will be useful to determine if dissolved methane concentrations in the order of several thousand µg/L persist.

7.4 Surface Water, Stormwater, and Pore-Water

Surface water at the site was monitored in 2021 at three locations on the southwest side of the landfill along an unnamed tributary to Pushaw Stream (SW-1, SW-2, and SW-3). Stormwater was monitored at three stormwater detention ponds (SW-DP1, SW-DP5, and SW-DP6) during 2021. Additionally, three pore-water sampling locations were monitored in 2021 at PWS10-1, PWS10-2, and PWS10-3, which are located along the landfill side of the bank of the unnamed tributary to Pushaw Stream.

Comparison of Key Indicator Parameters at Surface Water, Stormwater, and Pore-Water Monitoring Locations to JRL Leachate and Summary of Statistically Significant Trend Results

The 2021 annual maximum specific conductance values and chloride and arsenic concentrations for the JRL surface water, stormwater, and pore-water monitoring locations are summarized in Table 7-8. The Mann-Kendall analyses results for statistically significant trends for these parameters are also provided in Table 7-8. The complete results for Mann-Kendall analyses are provided in Appendix F.

TABLE 7-8

2021 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT SURFACE WATER, STORMWATER, AND PORE-WATER MONITORING LOCATIONS

Location Designation	Annual Maximum Specific Conductance (21,200 µmhos/cm in JRL Leachate in July 2021)			Annual Maximum Chloride (9,900 mg/L in JRL Leachate in April 2021)			Annual Maximum Arsenic (0.45 mg/L in JRL Leachate in October 2021)		
	µmhos/cm	Statistically Significant Trend 3-Year	Statistically Significant Trend 5-Year	mg/L	Statistically Significant Trend 3-Year	Statistically Significant Trend 5-Year	mg/L	Statistically Significant Trend 3-Year	Statistically Significant Trend 5-Year
SW-1	308	–	–	8.3	–	–	0.005 U	–	–
SW-2	67	Decreasing	Decreasing	13	–	–	0.005	–	–
SW-3	68	–	Decreasing	8.9	–	–	0.005	–	–
SW-DP1	82	–	–	2.5	–	–	0.008	–	–
SW-DP5	69	Decreasing	Decreasing	4.3	Decreasing	Decreasing	0.008	–	–
SW-DP6	62	–	–	5.8	–	Decreasing	0.005 U	–	–
PWS10-1	246	–	–	9.2	–	–	0.005 U	–	–
PWS10-2	99	–	–	8.3	–	–	0.005 U	–	–
PWS10-3	105	–	–	5.7	–	–	0.009	–	–

Notes:
U = not detected above indicated laboratory reporting limit
– = no trend
I = insufficient data

The 2021 surface water, stormwater, and pore-water monitoring location data are generally characterized by low values of key indicator parameters by comparison to the JRL leachate (i.e., LT-C4LR). This is consistent with historical data at these locations. The arsenic concentrations at the surface water, stormwater, and pore-water monitoring locations during 2021 were within their respective historical ranges. The specific conductance values and chloride concentrations at the surface water monitoring locations were within their respective historical ranges. There were several new historical minimum specific conductance values and chloride concentrations measured at the stormwater and pore-water monitoring locations during 2021, which are summarized as follows:

- PWS10-1 – New historical minimum specific conductance value (67 µmhos/cm in July 2021) and chloride concentration (2.4 mg/L in July 2021);
- PWS10-2 – New historical minimum chloride concentration (2.8 mg/L in July 2021);
- SW-DP1 – New historical minimum chloride concentration (less than the laboratory reporting limit of 1.0 mg/L in October 2021);
- SW-DP5 – New historical minimum chloride concentration (less than the laboratory reporting limit of 1.0 mg/L in July 2021);
- SW-DP6 – New historical minimum specific conductance value (38 µmhos/cm in July 2021) and chloride concentration (less than the laboratory reporting limit of 1.0 mg/L in July 2021);

The Mann-Kendall trends summarized in Table 7-8 indicate stable or decreasing values for specific conductance, chloride, and arsenic at surface water, stormwater, and pore-water monitoring locations over the past three to five years.

Further description of the JRL surface water, stormwater, and pore-water sampling locations and notable observations from their 2021 water quality data are provided below.

<u>Surface Water Monitoring Locations:</u> Along the unnamed tributary to Pushaw Stream, surface water quality at SW-1, SW-2, and SW-3 has been very consistent since sampling began at these locations in the early 1990s. Parameter concentrations during the 2021 sampling events at downstream locations SW-1 and SW-3 were generally similar to those measured at SW-2, which is located upstream from the landfill. Parameters analyzed at SW-1 and SW-3, located downstream from the landfill, remain at relatively low values that do not indicate influence from landfill leachate. The few parameter concentrations at SW-1, SW-2, and SW-3 that were outside of their respective historical ranges for these monitoring locations in 2021 are identified on the individual water quality summary sheets contained in Appendix E.

The iron concentrations at SW-1, SW-2, and SW-3 exceeded the MFCCC standard of 1 mg/L during the July 2021 monitoring event at concentrations of 2.1 mg/L, 1.8 mg/L, and 1.4 mg/L, respectively. Iron also exceeded its MFCCC in October 2021 at SW-1 and SW-3 with concentrations of 1.2 mg/L and 1.5 mg/L, respectively. MFCCC exceedances for iron have occurred historically at these locations, and the 2021 iron concentrations at each of these locations were within their respective historical ranges. Iron concentrations were below the MFCCC standard at SW-1, SW-2, and SW-3 in April 2021 and at SW-2 in

October 2021. There were no other MFCCC exceedances at SW-1, SW-2, and SW-3 for parameters analyzed during 2021.

There were not multiple parameters (i.e., four or more) with statistically significant increasing or decreasing trends at SW-1, SW-2, and SW-3 over the past three years and five years.

Stormwater Monitoring Locations: Samples from SW-DP1 are obtained from a stormwater detention pond at the downstream western edge of the JRL site. Samples from SW-DP5 are obtained from an outfall on the west side of Detention Pond #5. Samples from SW-DP6 are obtained from a stormwater detention pond sampling location at the southern end of the site.

The historical range of parameter concentrations at SW-DP1 have generally been low since sampling began at this location in 2004 and have not indicated influences from landfill leachate or landfill operations. As discussed in last year's evaluation (i.e., for 2020 monitoring data), the April 2020 monitoring data indicated a spike in many parameter values at SW-DP1. The increase in parameter values was attributed to an overboard discharge that occurred from the active landfill in the vicinity of SW-DP1 prior to sample collection in April 2020. The MEDEP was notified of the discharge and residual material was removed by NEWSME. Table 7-9 provides a summary of stormwater quality for several parameters from April 2020 in comparison to the previous monitoring event (i.e., October 2019) and to values detected at the end of 2021 monitoring in October.

TABLE 7-9

SUMMARY OF RECENT STORMWATER QUALITY CHANGES AT SW-DP1

Parameter	October 2019	April 2020	October 2021
Specific Conductance (µmhos/cm)	106	439	82
Calcium (mg/L)	15	24	15
Potassium (mg/L)	2.1	12	1.6
Total Dissolved Solids (mg/L)	84	251	83
Sodium (mg/L)	1.6	27	1.3
Chloride (mg/L)	2.2	79	1.0 U
Bromide (mg/L)	0.10 U	1.1	0.10 U

Notes:
U – not detected above the indicated laboratory reporting limit

As shown in Table 7-9, the parameters observed to have been impacted from the overboard discharge during the April 2020 monitoring have returned to values similar to those prior to the overboard discharge.

Stormwater quality monitoring at SW-DP5 began in April 2013. The 2021 water quality from SW-DP5 included low parameter values that do not indicate influences from landfill leachate or landfill operations. There were new historical maximum values for iron, manganese, total phosphorus, total suspended solids,

and organic carbon in 2021 at SW-DP5 and new historical minimum values for potassium, sodium, and chloride. The most notable parameter increase at SW-DP5 during 2021 was an iron concentration of 5.2 mg/L in April 2021, which exceeded the previous historical maximum value of 1.7 mg/L. The key indicator parameter values for comparison to JRL leachate remain very low at SW-DP5 with values as low as 62 µmhos/cm for specific conductance (July 2021), less than the laboratory reporting limit of 1.0 mg/L for chloride (July 2021), and less than the laboratory reporting limit of 0.005 mg/L for arsenic (April 2021).
Stormwater quality monitoring at SW-DP6 began in October 2009. The stormwater quality at SW-DP6 during 2021 is characterized by continued low parameter concentrations that do not indicate influences from landfill leachate or landfill operations. All monitored parameters at SW-DP6 remained below their respective historical maximums during 2021. There were five parameters at DW-DP6 with new historical minimum values detected during 2021 (specific conductance, pH, calcium, sodium, and chloride). The key indicator parameter values for comparison to JRL leachate remain very low at SW-DP6 with values as low as 38 µmhos/cm for specific conductance (July 2021), less than the laboratory reporting limit of 1.0 mg/L for chloride (July 2021), and less than the laboratory reporting limit of 0.005 mg/L for arsenic (April 2021, July 2021, and October 2021).

The iron concentrations at SW-DP1, SW-DP5, and SW-DP6 exceeded the MFCCC standard of 1 mg/L during one or more of the 2021 monitoring events. The exceedances are summarized below:

- SW-DP1 – 3.5 mg/L iron in April 2021 and 6.4 mg/L iron in July 2021;
- SW-DP5 – 5.2 mg/L iron in April 2021 and 3.5 mg/L iron in July 2021; and
- SW-DP6 – 1.6 mg/L iron in July 2021.

MFCCC exceedances for iron have occurred historically at these locations. There were no other MFCCC exceedances at SW-DP1, SW-DP5, and SW-DP6 for parameters analyzed during 2021.

Several parameter concentrations at SW-DP1, SW-DP5, and SW-DP6 were outside of their respective historical ranges for these monitoring locations in 2021, which are identified on the individual water quality summary sheets contained in Appendix E.

There were not multiple parameters (i.e., four or more) with statistically significant increasing or decreasing trends at SW-DP5 and SW-DP6 over the past three years and five years. There were five parameters (iron, manganese, potassium, total dissolved solids, and total suspended solids) with statistically significant increasing trends at SW-DP1 over the past five years but only one parameter with an increasing trend over the past three years (iron). This is an improvement for last year's evaluation when there were eleven parameters with statistically significant increasing trends at SW-DP1 over the past three years. These improvements indicate recovery from the water quality impacts from the aforementioned overboard discharge that affected SW-DP1 water quality in 2020.

Pore-Water Monitoring Locations: Pore-water sample locations PWS10-1, PWS10-2, and PWS10-3, which are located along the landfill side of the bank of the unnamed tributary to Pushaw Stream, have been sampled since 2010. These sampling locations are intended to be representative of groundwater quality as it discharges to the stream. Due to their local hydrologic setting (i.e., shallow fluctuating water table with high natural organic matter associated with the wetland and stream), they are characterized by iron and total organic carbon concentrations that are typically greater than in groundwater from other areas of the site. Groundwater quality has been generally consistent at all three pore-water sampling locations since sampling began at these locations in 2010 and does not indicate influences from landfill leachate or landfill operations.

While visual review of the 2021 and historical pore-water quality data indicates generally stable water quality, there are one or more parameter concentrations at PWS10-1, PWS10-2, and PWS10-3 that were outside of the range of historical minimum and maximum values for these monitoring locations in 2021. These occurrences are identified on the individual water quality summary sheets contained in Appendix E.

There were not multiple parameters at PWS10-2 and PWS10-3 with statistically significant decreasing or increasing trends over the past three years and five years. There were four parameters (potassium, total dissolved solids, organic caron, and dissolved methane) with statistically significant increasing trends over the past five years at PWS10-1. There were not multiple parameters (i.e., four or more) at PWS10-1 with statistically significant decreasing trends over the past three and five years or increasing trends over the past three years.

The pore-water samples were analyzed for dissolved methane during the April, July, and October 2021 monitoring events, as recommended by the MEDEP. The dissolved methane concentrations for pore-water samples in 2021 are summarized in Table 7-10.

TABLE 7-10

2021 DISSOLVED METHANE CONCENTRATIONS AT PORE-WATER MONITORING LOCATIONS

Location Designation	April 2021 (µg/L)	July 2021 (µg/L)	October 2021 (µg/L)
PWS10-1	1,600	190	700
PWS10-2	79	95	190
PWS10-3	400	140	130

The 2021 dissolved methane concentrations are lower than the historical maximum concentrations detected at PWS10-1 (4,600 µg/L in July 2015), PWS10-2 (690 µg/L in July 2015), and PWS10-3 (4,000 µg/L in July 2020). The historical dissolved methane detections at these locations are consistent with their hydrologic setting in a freshwater wetland and are attributed to anaerobic biological processes in the saturated wetland soils. Studies of freshwater wetlands in the southeastern portion of the United States show wetland pore-water samples with dissolved methane concentrations of more than 20,000 µg/L in the top 25 centimeters of saturated soils[26]. The lower dissolved methane concentrations at JRL wetlands are likely attributed to the cooler climate in the northeastern portion of the United States, which limits anaerobic biological activity.

While the pore-water sampling locations are grouped with surface water and stormwater monitoring locations, the samples are obtained from soil and the sampling results from these locations are compared to MCL and MEG standards for groundwater. There were no MCL exceedances during 2021 at the pore-water monitoring locations for the parameters analyzed. The MEG exceedances for parameters analyzed during 2021 at the pore-water monitoring locations are summarized as follows:

- Manganese was above its MEG of 0.3 mg/L in 2021 at PWS10-1 (0.42 mg/L in July 2021 and 1.3 mg/L in October 2021);
- Manganese was above its MEG of 0.3 mg/L in 2021 at PWS10-3 (0.45 mg/L in April 2021, 0.48 mg/L in July 2021, and 0.57 mg/L in October 2021); and
- Iron was above its MEG of 5.0 mg/L in 2021 at PWS10-1 (5.3 mg/L in October 2021).

7.5 Baseline Water Quality Monitoring Wells for Cell 13

During 2021, SME performed baseline water quality monitoring at eleven Cell 13 monitoring wells. Monitoring wells MW-503, MW-504, MW-505, PW-08-01, P-04-11A, P-04-11B, OW-607B, OW-608B, and OW-609B were sampled for baseline parameters in February, April, June, and August 2021. Monitoring well MW-506 could not be sampled in June 2021 because the groundwater level was too low to pump with a peristaltic pump. A bladder pump was installed at MW-506. Monitoring well MW-506 was sampled for baseline parameters in February, April, July, and September 2021. Monitoring well OW-606B was frozen in February 2021 so it was sampled for baseline parameters in April, June, July, and August 2021. The Cell 13 monitoring wells were also sampled in October 2021 for detection monitoring parameters.

The locations of the Cell 13 monitoring wells are shown in Figure 1-2 and well construction details are summarized in Table 2-5. These locations were analyzed for the baseline monitoring parameters listed in Table 3-2.

[26] Schipper LA, Reddy KR (1994) Methane production and emissions from four reclaimed and pristine wetlands of southeastern U.S. *Soil Science Society of America Journal* 58, 1270-1275.

The baseline water quality monitoring data results from the Cell 13 monitoring wells were submitted to MEDEP in 2021.[27,28,29,30] The results are summarized below.

- The 2021 annual maximum specific conductance values and chloride concentrations at the baseline water quality monitoring wells for Cell 13 are shown in Table 7-11.

TABLE 7-11

2021 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE CONCENTRATIONS AT BASELINE WATER QUALITY MONITORING WELLS FOR CELL 13

Monitoring Well	Specific Conductance (µmhos/cm)	Chloride (mg/L)	Implementation Schedule
MW-503	207 (February 2021)	17 (February 2021 and April 2021)	Cell 13
MW-504	139 (April 2021)	3.2 (February 2021)	Cell 13
MW-505	329 (February 2021)	22 (February 2021)	Cell 13
MW-506	837 (February 2021)	57 (February 2021)	Cell 13
PW-08-01	229 (April 2021)	6.9 (February 2021)	Cell 13
P-04-11A	126 (April 2021 and October 2021)	2.2 (February 2021)	Cell 13

- Groundwater samples from the Cell 13 baseline groundwater quality monitoring wells were analyzed for VOCs during the 2021 monitoring events. There was only one VOC detected, during only one monitoring event, at one of the Cell 13 baseline groundwater quality monitoring wells during 2021. Chloroform, a common laboratory contaminant, was detected at a low concentration of 1.4 µg/L at OW-609B during the April 2021 monitoring event. Chloroform was below the laboratory reporting limit of 1.0 µg/L at OW-609B during the February 2021, June 2021, and August 2021 monitoring events.
- Groundwater samples from the Cell 13 baseline groundwater quality monitoring wells were analyzed for dissolved methane during the 2021 monitoring events. There were no dissolved methane detections above the laboratory reporting limit of 20 µg/L at the Cell 13 baseline groundwater quality monitoring wells during 2021.

The Cell 13 baseline groundwater quality monitoring wells were incorporated into the EMP during the October 2021 monitoring event to monitor the operations of the JRL landfill expansion. The baseline, October 2021, and 2022 water quality data from these wells will be incorporated into the 2022 Annual Water Quality Report for the JRL.

7.6 Leak Detection System

The approved permitted landfill expansion liner system for Cell 11 through Cell 17 includes leak detection layers under the primary liner systems. The 2015 Liner Action Plan (LAP) describes the methods to monitor the performance of the primary liner system of Cell 11 through Cell 17 and outlines response actions should action levels be exceeded in the leak detection layer. The LAP uses a calculated Leak Detection System Action Level (LDSAL) to determine the need for additional actions. The LDSAL formula is based on the flow measured in the leak detection layer and the specific conductance measured in the leachate and leak detection layers. The LDSAL is compared to the leak detection specific conductance that is measured each month. If the LDSAL is equal to or greater than the leak detection specific conductance, no further action is needed. The Cell 11 and Cell 12 leak detection systems were monitored throughout 2021 in accordance with the LAP and there were no LDSAL exceedances.

Sampling began at two landfill leak detection sampling locations in 2021. The 2021 water quality from LF-LD-11 and LF-LD-12 monitors liquid from the leak detection systems for Cell 11 and Cell 12, respectively. The LF-LD-11 and LF-LD-12 monitoring locations are shown on Figure 2-1. The samples are collected from the pump stations where liquids from the leak detection systems drain. The leak detection monitoring locations were monitored during the July 2021 and October 2021 monitoring events for parameters in the detection monitoring program and for field parameters only in August, September, November, and December 2021. The 2021 water quality for LF-LD-11 and LF-LD-12 are summarized below:

- A summary of the 2021 leak detection annual maximum values for key indicator parameters for comparison to the JRL leachate is provided in Table 7-13. Based on the very low chloride and arsenic concentrations at LF-LD-11 and LF-LD-12 during 2021, the liquid sampled from those locations does not indicate the presence of leachate in the leak detection systems. The specific conductance values at LF-LD-11 and LF-LD-12 are greater than those typical at upgradient monitoring locations, which is likely the result of the recent construction of Cell 11 and Cell 12.

TABLE 7-13

2021 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT LEAK DETECTION MONITORING LOCATIONS

Leak Detection Monitoring Location	Annual Maximum Specific Conductance (21,200 µmhos/cm in JRL Leachate in July 2021)	Annual Maximum Chloride (9,900 mg/L in JRL Leachate in April 2021)	Annual Maximum Arsenic (0.45 mg/L in JRL Leachate in October 2021)
LF-LD-11	884 (October 2021)	1.0 U (July 2021 and October 2021)	0.005 U (July 2021 and October 2021)
LF-LD-12	737 (July 2021)	1.5 (July 2021)	0.005 (October 2021)

Note:
U – not detected above the indicated laboratory reporting limit

- Samples from the LF-LD-11 and LF-LD-12 were analyzed for dissolved methane during the July 2021 and October 2021 monitoring events. Dissolved methane was detected at annual maximum concentrations of 59 µg/L at LF-LD-11 in July 2021 and 170 µg/L at LF-LD-12 in October 2021.

8.0 WATER QUALITY GAS MONITORING

As part of the 2021 environmental monitoring program, methane gas was measured during the collection of water quality samples at the site monitoring well standpipes, underdrain outfalls, leachate collection system, leachate pond leak detection system, and JRL site property boundaries using a hand-held gas meter. All methane gas monitoring results were below the meter detection limit.

Hydrogen sulfide (H_2S) was also monitored at the above-mentioned locations in 2021 and was not detected at any of the locations.

Historical and 2021 gas monitoring results for the site are included in Appendix I. The 2021 gas monitoring results indicate no landfill-related gases are present at the monitored locations.

9.0 SUMMARY AND RECOMMENDATIONS

9.1 Summary

Water quality samples were obtained in April, July, and October 2021 at the JRL in accordance with the current site EMP. The 2021 water quality data for the JRL is consistent with the historical data for the site and with the setting of monitoring locations among the construction and operational activities of the landfill. Site groundwater and surface water quality data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The evaluation of site water quality, which incorporates the 2021 water quality data, identifies trends at multiple locations and for a number of parameters, both upgradient and downgradient from the landfill. Historical groundwater quality data through 2021 indicate that these trends, however, are largely attributable to landfill operations and changes in redox conditions, which occur as expected around the landfill due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.[31] The JRL site-wide water quality are summarized below:

Leachate Monitoring Location

Leachate parameter values from monitoring location LT-C4LR during 2021 and historically since July 2013 are generally characterized by high parameter values. Generally, at a given water quality monitoring location, if landfill leachate were present, there would be a notable, significant increase in specific conductance values and chloride and arsenic concentrations (in conjunction with changes in other parameter concentrations) due to their presence at high concentrations in the JRL leachate. In 2021, the annual maximum value of specific conductance in JRL leachate (i.e., monitoring location LT-C4LR) was 21,200 µmhos/cm in July 2021. The annual maximum concentrations of chloride and arsenic at monitoring location LT-C4LR were 9,900 mg/L (April 2021) and 0.45 mg/L (October 2021), respectively.

Underdrain Monitoring Locations

There was no flow at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 during any of the three 2021 detection monitoring events; thus, no samples were obtained at these locations during 2021. LP-UD-1 was monitored during the September and October monitoring events for field parameters only. These occurrences of no flow at these underdrain monitoring locations are generally consistent with previous observed patterns with the exception of LF-UD-2. The decrease in flow from LF-UD-2 is likely associated with the lowering of the groundwater table that has resulted from the construction of the landfill expansion cells (see Section 1.2).

[31] The MEDEP agreed with this assessment in its review of the 2017 Annual Report. MEDEP, February 20, 2018, Memorandum regarding the 2017 Annual Report, Juniper Ridge Landfill, Old Town, Maine, MEDEP Lic. #S-020700-7A-A-N and Amendment #S-020700-WD-N-A, Prepared by Sevee and Maher Engineers, Inc., April 2015.

Where there was flow during 2021 from underdrain monitoring locations (LF-UD-4, LF-UD-5and6, LF-UD-6, and LP-UD-2), the underdrain monitoring data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The greatest specific conductance value measured during 2021 was at LF-UD-6 (1,365 µmhos/cm in August 2021), which is greater than the previous historical maximum value of 919 µmhos/cm measured in August 2013. Specific conductance was measured at a lower value of 295 µmhos/cm later in the year (October 2021) at LF-UD-6 and there is currently a five-year statistically significant decreasing trend for specific conductance at LF-UD-6. The annual maximum chloride concentration at LF-UD-6 during 2021 is low (18 mg/L), which indicates that the periodic high specific conductance values measured at LF-UD-6 are not from leachate influence. There were no specific conductance values above 500 µmhos/cm at the remaining underdrain monitoring locations monitored in 2021.

During 2021, annual maximum chloride concentrations from the sampled underdrain monitoring locations (ranging from 1.3 mg/L at LF-UD-4 to 18 mg/L at LF-UD-6) were low relative to the JRL leachate and do not indicate influence from the presence of landfill leachate.

The arsenic concentrations in the underdrain monitoring locations sampled during 2021 were low (ranging from less than the laboratory reporting limit of 0.005 mg/L at LP-UD-2 and LP-UD-5and6 to 0.011 mg/L at LF-UD-6) and generally consistent with those at groundwater monitoring wells across the site, including multiple upgradient monitoring locations.

VOCs were analyzed at all sampled underdrain locations (both landfill and former leachate pond underdrains) in April 2021. There were no VOCs detected in 2021 above laboratory reporting limits at any of the sampled underdrain locations.

Groundwater Monitoring Locations

Based on review of 2021 and historical data, SME has identified 24 of the 36 site-wide groundwater monitoring locations with water quality that: (1) do not indicate influence from landfill leachate; and (2) show limited influence from landfill construction operations (see Table 7-4). The annual maximum specific conductance values at these wells range from 111 µmhos/cm to 424 µmhos/cm. The annual maximum chloride concentrations at these monitoring locations were very low and ranged from 1.3 mg/L to 16 mg/L. These wells also exhibit limited or no statistically significant increasing trends.

More pronounced water quality changes have been observed at 12 of the site groundwater monitoring locations (see Table 7-4), which include wells both upgradient and downgradient from the landfill. These changes are evidenced at some monitoring locations by the statistically significant trends for multiple parameters. These trends are largely attributable to changes in redox conditions, which occur as expected around the landfill due to the construction and operations of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate landfill related impacts to water quality from malfunction of the landfill liners. This conclusion is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations and leak detection monitoring locations. These monitoring locations are discussed in detail in Section 7.3 and include: (1) upgradient monitoring locations MW12-303R and P-206A; (2) downgradient monitoring locations MW-223A, MW223B, MW-301, and MW-302R; and (3) OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507, which are downgradient from the landfill expansion. Current and recent water quality at these locations are summarized below:

Upgradient Monitoring Locations MW12-303R and P-206A: Despite recent increasing parameter values at upgradient monitoring location P-206A, its groundwater quality is still characterized by low parameter concentrations. There were no MCL and/or MEG exceedances for parameters analyzed at P-206A during 2021. Despite current statistically significant increasing trends over the past three and five years, visual review of water quality trends indicates that the rate of increase has slowed considerably over the past few years. Water quality at P-206A does not appear to be affected by performance of landfill cells or leachate collection and transport systems. Roadway maintenance practices in the vicinity of P-206A could be improved to avoid impacting water quality. Upgradient monitoring location MW12-303R is located in an area that historically has been influenced by roadway maintenance and runoff, and from site construction activities. After review of the April 2018 water quality sampling results at MW12-303R, when there were eight water quality parameters detected at new historical maximum values, SME further investigated the water quality changes at MW12-303R. The water quality at MW12-303R and visual observations of the area surrounding the well indicated the well was likely being influence by stockpiled snow from plowing and stormwater runoff from the access road to Cell 10, which began receiving waste in October 2017. In early summer of 2018, the access roadway and the area surrounding MW12-303R were regraded to divert stormwater runoff away from the well and the well was purged.

The recent water quality parameter value increases observed at MW12-303R appear to be stabilizing or improving.

Water quality at MW12-303R does not appear to be adversely affected by performance of landfill cells or leachate collection and transport systems, based on key indicator parameters at the landfill underdrain monitoring locations.

MW-223A, MW-223B, MW-302R: As discussed in Section 7.3, previous water quality evaluations identified similarities among the Scale House Well, the Office Well, MW-302R, MW-223A, and MW-223B, and showed that they are distinct from the chemical signature of the leachate from LT-C4LR. Water quality assessment, the results of bedrock pumping tests conducted in 2009, and the established hydrogeology in this area indicate that water quality in MW-302R, MW-223A, and MW-223B may in part be associated with upgradient water quality in the vicinity of the Office Well and Scale House Well in addition to the sources previously identified, a former topsoil and stump stockpile area and a subsurface wastewater disposal field located along this preferential groundwater flow direction.

Aside from the seasonal fluctuation in water quality data at MW-302R associated with seasonal stormwater levels in adjacent Detention Pond #5, the water quality is generally stable. Annual maximum specific conductance values and chloride and arsenic concentrations at MW-302R during 2021 were 662 µmhos/cm, 68 mg/L, and 0.006 mg/L, respectively. Sodium was the only parameter with an MCL and/or MEG exceedance at MW-302R during 2021.

Visual review of water quality trends at MW-223A and MW-223B show distinct increases in multiple parameter concentrations since about 2005 or later. Previously increasing concentrations of chloride have generally been decreasing over the past five years at MW-223A and have generally been stable at MW-223B. There were no MCL and/or MEG exceedances for parameters analyzed at MW-223A and MW-223B during 2021.

Based on review of current values and trends of key indicator parameters at the landfill underdrain monitoring locations, we do not interpret recent water quality and noted trends at MW-223A, MW-223B, and MW-302R as related to the performance of landfill cells or leachate collection and transport systems.

<u>MW-301</u>: The groundwater quality at MW-301 is consistent with its setting as a monitoring location downgradient from the landfill. There are no current concerns with water quality results at this location related to the performance of landfill cells or leachate collection and transport systems. Although parameter concentrations at MW-301 remained relatively low during 2021, as noted in Section 7.3, there are increasing trends in the water quality data that may be associated with a 2013 well repair (discussed in Section 7.3).

There were no parameters analyzed at MW-301 that exceeded MCL or MEG standards in 2021.

<u>OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507</u>: Baseline groundwater quality was monitored at these locations downgradient from the landfill expansion in 2018. Detection monitoring began at OW-06-03, OW-601A, and OW-601B in 2019 and at OW-606A, OW-611A, and MW-507 in 2021. It is early in the monitoring history for these locations downgradient from the landfill expansion; routine monitoring will continue in 2022 and beyond, and additional data will be useful for evaluating groundwater quality influences from the landfill expansion construction.

Specific conductance values and/or chloride concentrations remain somewhat greater than at monitoring locations upgradient from the JRL at OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507. There were no MCL or MEG exceedances for parameters analyzed at these downgradient locations during 2021, with the exceptions of iron at OW-06-03 (23 mg/L in July 2021) and manganese (8.7 mg/L in July 2021) at OW-06-03.

Monitoring locations OW-06-03, OW-601A, OW-601B, and OW-606A are located in close proximity to the landfill access road and may be influenced by winter road salting. OW-611A is located proximate to MW-223A and MW-223B (discussed above); this location and other downgradient expansion monitoring locations and may likewise be associated with a preferential groundwater flow path from northeast to southwest.

Review of Stiff diagrams plotted using July 2021 data for landfill expansion downgradient monitoring wells OW-06-03, OW-601A, OW-601B, OW-606A, OW-611A, and MW-507 (Section 7.3, Appendix H) indicates a similar chemical signature to those of MW-223A, MW-223B, and MW-302R and a clear distinction from the chemical signature of the leachate from LT-C4LR (Appendix G).

Arsenic is the only parameter analyzed in groundwater monitoring wells detected above its MCL in 2021. There were only three monitoring wells in the detection monitoring analytical program with arsenic concentrations detected above its MCL (0.01 mg/L) during 2021. The maximum arsenic concentration detected at site-wide monitoring locations was 0.021 mg/L at MW-402B in October 2021. There were no arsenic concentrations detected above its MCL at pore-water or its MFCCC at surface water sampling locations in 2021.

Surface Water, Stormwater, and Pore-Water Monitoring Locations

The 2021 surface water, stormwater, and pore-water monitoring location data are generally characterized by very low values of key indicator parameters by comparison to the JRL leachate (i.e., LT-C4LR). This is generally consistent with historical data at these locations.

Dissolved Methane Monitoring

Of the seventeen locations from which samples were obtained for dissolved methane analysis in 2021, the parameter was only detected above laboratory reporting limits in four locations. Dissolved methane was detected at MW-502 at low concentrations of 190 µg/L in July 2021 and 37 µg/L in October 2021. Dissolved methane was detected at OW-608A at a low concentration of 140 µg/L in October 2021 but was not detected above the laboratory reporting limit of 20 µg/L in July 2021. Dissolved methane was detected at a low concentration of 41 µg/L at OW-602A in July 2021. Dissolved methane was detected at a concentration of 2,900 µg/L at OW-06-03 in July 2021. There are no prior monitoring data for dissolved methane at this location, where routine monitoring has just begun, so no comparison with historical detection is possible for 2021.

Dissolved methane was detected in underdrain monitoring locations LF-LD-11 and LF-LD-12 at low annual maximum concentrations of 59 µg/L at LF-LD-11 in July 2021 and 170 µg/L at LF-LD-12 in October 2021.

Pore-water samples were analyzed for dissolved methane as discussed in Section 7.4. The annual maximum dissolved methane in pore-water samples are lower than the historical maximum concentrations. The historical dissolved methane detections at these locations are consistent with their hydrologic setting in a freshwater wetland in the cool climate of the northeastern United States, and are attributed to anaerobic biological processes in the saturated wetland soils.

Leak Detection Monitoring Locations

Sampling began at landfill leak detection sampling locations LF-LD-11 and LF-LD-12 in 2021, as discussed in Section 7.6. These locations monitor liquid from the leak detection systems for Cell 11 and Cell 12, respectively. Sampling results show low chloride concentrations and specific conductance values well below those of JRL leachate (i.e., LT-C4LR), and do not indicate the presence of leachate in the leak detection systems for Cell 11 and Cell 12. 2021 specific conductance values at both leak detection monitoring locations were greater than those typical at upgradient monitoring locations, which is likely the result of the recent construction of Cell 11 and Cell 12.

2021 Baseline Monitoring Locations

Baseline monitoring at Cell 13 monitoring locations was conducted and results reported as discussed in Section 7.5, and baseline monitoring will be incorporated into the EMP in 2022. The baseline, October 2021, and 2022 water quality data from these wells will be incorporated into the 2022 Annual Water Quality Report for the JRL.

9.2 Closure and Recommendations

SME recommends that on-site snow removal and winter roadway maintenance practices minimize stockpiling of snow around monitoring locations proximate to roadways.

SME recommends continuing with the current site monitoring program in 2022, which will include water quality monitoring for Cell 13 monitoring wells MW-503, MW-504, MW-505, MW-506, PW-08-01, P-04-11A, P-04-11B, OW-606B, OW-607B, OW-608B, and OW-609B.

NOTES

1. BASE MAP PREPARED BY AERIAL SURVEY & PHOTO INC., NORRIDGEWOCK, MAINE. PHOTO DATE 7/5/17. VERTICAL DATUM: BRASS PLUG AT PUMP STATION AND AT THE ADMINISTRATION BUILDING. HORIZONTAL DATUM: MAINE STATE COORDINATES EAST ZONE NAD 83. GROUND CONTROL BY SEVEE & MAHER ENGINEERS, INC, CUMBERLAND, MAINE.
   CONTOURS WITHIN EXISTING CELL LINER LIMIT FROM LOW ALTITUDE AERIAL PHOTOGRAMMETRIC MAPPING PERFORMED BY SEVEE & MAHER ENGINEERS, INC. (SME) OF CUMBERLAND, MAINE, DATED DECEMBER 1, 2018. GROUND CONTROL BY SEVEE & MAHER ENGINEERS, INC (SME) OF CUMBERLAND, MAINE USING PROPELLER AEROPOINTS, DATED DECEMBER 1, 2018:
   HORIZONTAL DATUM - NAD83 MAINE, EAST, US FT.
   VERTICAL DATUM - NAVD 88, US FT.

2. PROPERTY LINE LOCATIONS ARE A RESULT OF FIELD SURVEY PERFORMED BY HERRICK AND SALSBURY, INC. LAND SURVEYORS, ELLSWORTH, MAINE FOR TRYTON TREE FARM PROJECT, PATTEN CORPORATION-DOWNEAST, OLD TOWN, MAINE, FEBRUARY 23, 1988, REVISED APRIL 7, 1988.

3. LOCATIONS OF EXPLORATIONS ARE APPROXIMATE.

4. GROUNDWATER CONTOURS BASED ON WATER LEVEL MEASUREMENTS RECORDED DURING SPRING AND FALL OF 2007 (WET AND DRY SEASONS RESPECTIVELY). SUMMER DATA FROM 2008 (WET AND DRY SEASONS RESPECTIVELY).

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
A - The sampling location was Inaccessible
A6 - Approximate value.
D - The sampling location was dry.
F1 - Well was flowing
F12 - Pipe under water, no sample taken.
F21 - Area flooded by water. Beaver dam in area.
F5 - Water level not high enough to pump.
L - Could not locate sampling location.
Q - An obstruction prevented the collection of data.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

- ! - The sampling location was damaged or destroyed.
- < - Less than specified amount
- A - The sampling location was Inaccessible
- D - The sampling location was dry.
- D3 - Sample too dark to take reading.
- DE - Decommissioned Location
- E2 - Estimated Field Value
- F - The sampling location was frozen.
- F1 - Well was flowing
- F12 - Pipe under water, no sample taken.
- F14 - Unable to measure flow.
- F6 - No flow. Sample not taken.
- H2 - Waterlevel higher than pipes. See LF-COMP for readings
- H5 - Waterlevel higher than pipes. See LP-COMP for readings
- H6 - Pipe under water, could not measure flow.
- H8 - No flow from pipe. See LF-COMP for readings
- H9 - No flow from pipe. See LP-COMP for readings
- I - The sampling location yielded insufficient quantity to collect a sample.
- L - Could not locate sampling location.
- M - Results are missing or not reliable due to a meter malfunction.
- M7 - No reading taken at this location.
- TK - Outside of range of available test kits (or below test kit range).
- U - Not Detected above the laboratory reporting limit.

REPORT PREPARED: 4/11/2022 07:03

FOR: Juniper Ridge Landfill

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
A - The sampling location was Inaccessible
D - The sampling location was dry.
F12 - Pipe under water, no sample taken.
F6 - No flow. Sample not taken.
H2 - Waterlevel higher than pipes. See LF-COMP for readings
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
J - Analyte was positively identified/Associated value is an estimate.
M10 - Due to a identified laboratory instrumentation malfunction, this analytical result is likely elevated–the laboratory has fixed the issue.
U - Not Detected above the laboratory reporting limit.

(SCALE HOUSE WELL)	Filtration	Arsenic	Calcium	Copper	Iron	Magnesium	Manganese	Potassium	Sodium	Boron
	-	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L
Date Type Sample ID										

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
A - The sampling location was Inaccessible
D - The sampling location was dry.
F12 - Pipe under water, no sample taken.
F6 - No flow. Sample not taken.
H2 - Waterlevel higher than pipes. See LF-COMP for readings
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Sample collection notes:

FILT - One or more analytical parameters were field filtered.
UF - No analytical parameters were field filtered

REPORT PREPARED: 4/11/2022 07:08

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
F12 - Pipe under water, no sample taken.
F6 - No flow. Sample not taken.
H2 - Waterlevel higher than pipes. See LF-COMP for readings
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Notes:

TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.

F12 - Pipe under water, no sample taken.

F6 - No flow. Sample not taken.

H2 - Waterlevel higher than pipes. See LF-COMP for readings

H8 - No flow from pipe. See LF-COMP for readings

I - The sampling location yielded insufficient quantity to collect a sample.

U - Not Detected above the laboratory reporting limit.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

- ! - The sampling location was damaged or destroyed.
- F12 - Pipe under water, no sample taken.
- F6 - No flow. Sample not taken.
- H2 - Waterlevel higher than pipes. See LF-COMP for readings
- H8 - No flow from pipe. See LF-COMP for readings
- I - The sampling location yielded insufficient quantity to collect a sample.
- U - Not Detected above the laboratory reporting limit.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
F12 - Pipe under water, no sample taken.
F6 - No flow. Sample not taken.
H2 - Waterlevel higher than pipes. See LF-COMP for readings
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

G - Greater than specified amount.

M10 - Due to a identified laboratory instrumentation malfunction, this analytical result is likely elevated–the laboratory has fixed the issue.

U - Not Detected above the laboratory reporting limit.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

E - Compound exceeded upper level of calibration range and required dilution.

U - Not Detected above the laboratory reporting limit.

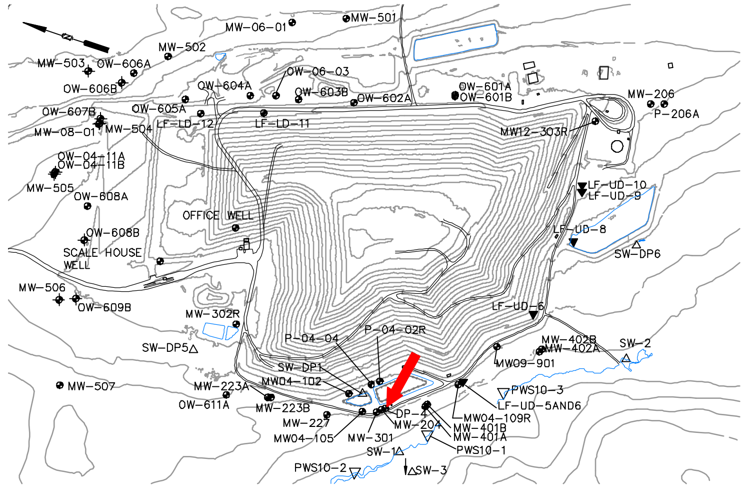
APPENDIX E

2021 WATER QUALITY SUMMARY REPORTS AND BOX & WHISKER PLOTS

SME
SEVEE & MAHER
ENGINEERS

Well Description

DP-4 is located downgradient of the landfill and former leachate pond and monitors groundwater quality within the overburden.



Screen Interval:	**18.5 ft. to 24.5 ft.**
Sampled:	**1 Time Annually(field parameters only)**
Sampled Since:	**01/30/04**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Chemical Summary

Indicator Parameters	2021 Q1	2021 Q2	2021 Q3	2021 Q4	Historical (1/1/1980 - 12/31/2021) Min		Max	Mean		SE	n
Specific Conductance (µmhos/cm @25°C)				268	100	to	965	340	±	23	37
pH (STU)				6.1	5.6	to	7.3	6.5	±	0.059	37
Temperature (Deg C)				14.8	6	to	23.9	13	±	0.64	37
Water Level Elevation (Feet)				154.59	152.18	to	156.12	150	±	0.14	37
Eh (mV)				193	-51	to	352	240	±	14	36
Dissolved Oxygen (mg/L)				0.7	0.4	to	6	1.8	±	0.26	37
Turbidity (field) (NTU)				4.9	0.6	to	36.2	8.7	±	1.3	37

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Well Description

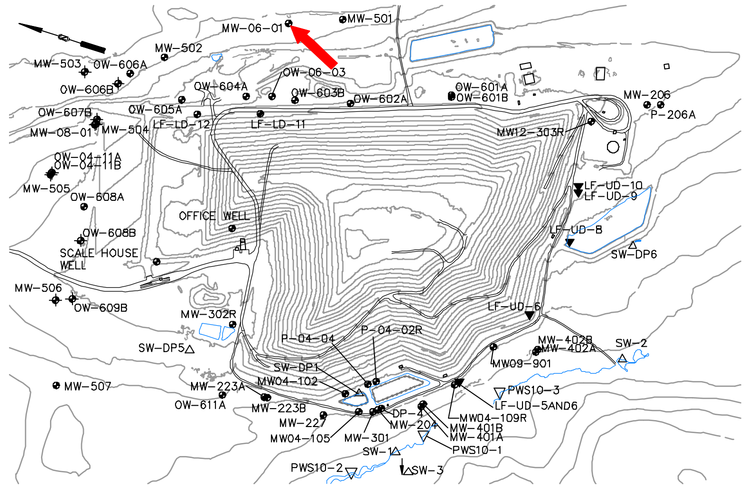
MW06-01 monitors overburden groundwater downgradient and east of the landfill expansion.



Screen Interval:	**10 ft. to 20 ft.**
Sampled:	**3 Times Annually**
Sampled Since:	**Apr-18**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Chemical Summary

Indicator Parameters	2021 Q1	2021 Q2	2021 Q3	2021 Q4	Historical (1/1/1980 - 12/31/2021) Min	Max	Mean	SE	n

Methane (ug/L)		20 U			No historical data for Methane.				

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Ammonia (N) MEG16=30 mg/L, Sodium MEG16=20 mg/L, Manganese MEG16=0.3 mg/L, Iron MEG16=5 mg/L, Copper MEG16=0.5 mg/L, MCL=1.3 mg/L, Arsenic MEG16=0.01 mg/L, MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

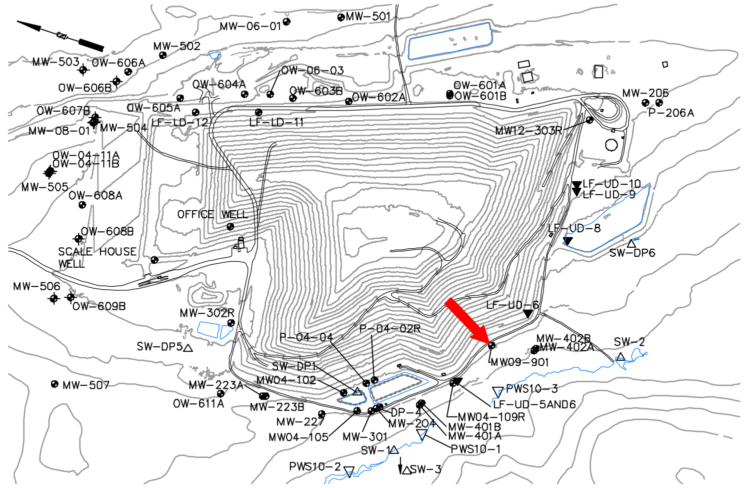
Juniper Ridge Landfill

MW06-01

Sevee & Maher Engineers, Inc.

Well Description

MW09-901 is located to the south of Cell #5 and detention pond #2 of the landfill. This well monitors water quality within the overburden downgradient of the landfill.



Screen Interval:	**15 ft. to 20 ft.**
Sampled:	**3 Times Annually**
Sampled Since:	**12/08/2009**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Juniper Ridge Landfill

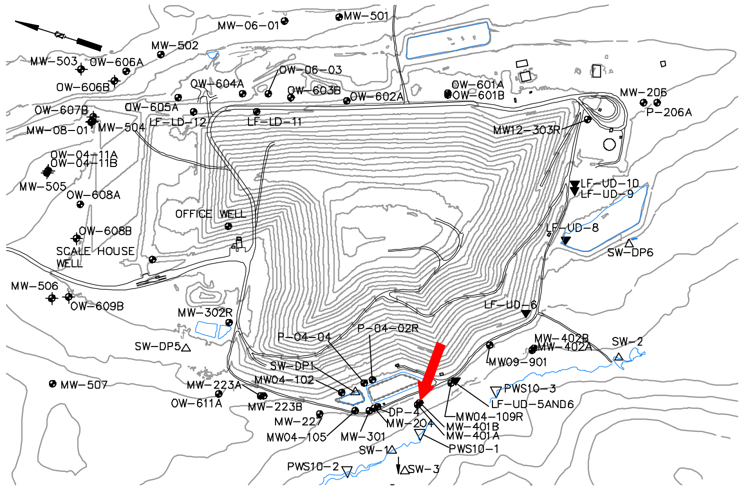
MW-401A

Sevee & Maher Engineers, Inc.

Well Description



MW-401B is located downgradient of the landfill and former leachate pond and monitors groundwater quality in the overburden.

Screen Interval: **10 ft. to 20 ft.**

Sampled: **3 Times Annually**

Sampled Since: **07/29/04**

Material Screened: **Overburden**

Well Condition: **Good**

Sampling Method: **Low Flow**

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a “U” qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sodium MEG16=20 mg/L, Manganese MEG16=0.3 mg/L, Iron MEG16=5 mg/L, Arsenic MEG16=0.01 mg/L, MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

*Only field parameters are collected during the summer and fall sampling events.

Q3= 7 - 2021 U = Not Detected above the laboratory reporting limit.

Q4= 10 - 2021

Juniper Ridge Landfill

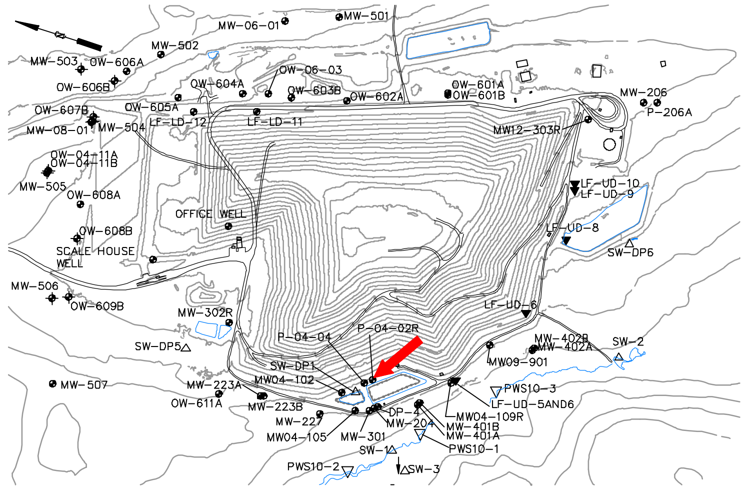
OW-611A

Sevee & Maher Engineers, Inc.

Well Description

P-04-02R monitors the water quality in the overburden downgradient of the landfill, between the former leachate pond and the landfill toe. P-04-02R replaced well P-04-02 in 2015. Survey info received on 2/1/2019



Screen Interval:	**27.13 ft. to 32.13 ft.**
Sampled:	**3 Times Annually**
Sampled Since:	**7/15/15**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Juniper Ridge Landfill

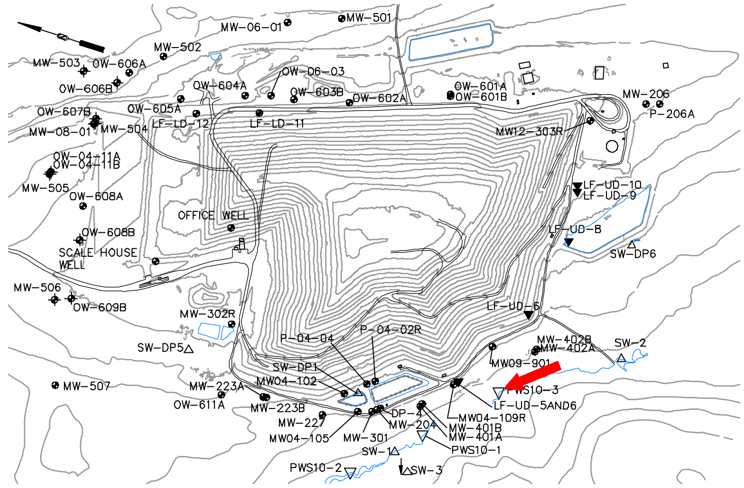
PWS10-2

Sevee & Maher Engineers, Inc.

Well Description



PWS10-3 is a pore water sampling location along the unnamed tributary to Pushaw stream. PWS10-3 is downgradient of the landfill.

Screen Interval:

Sampled: **3 Times Annually**

Sampled Since: **04/26/2010**

Material Screened:

Well Condition: **NA**

Sampling Method: **Low Flow**

SME SEVEE & MAHER ENGINEERS

Juniper Ridge Landfill annual stats 2021 G7

Ca-mg Hardness (CaCO3) (mg/L)	↓1300			1400 to 6212	2400 ± 370	12
Bicarbonate Alkalinity (CaCO3) (mg/L)	2300	2900	2800	1370 to 4710	3000 ± 120	36
Alkalinity (CaCO3) (mg/L)	2300			1370 to 3700	2600 ± 210	12
Organic Carbon (mg/L)	330	520	450	110 to 2560	870 ± 110	36
Biochemical Oxygen Demand (mg/L)	150			39 to 4850	1300 ± 290	23
Chemical Oxygen Demand (mg/L)	1700			959 to 8110	3400 ± 440	24
Chloride (mg/L)	9900	6800	4800	2560 to 24300	11000 ± 870	36
Bromide (mg/L)	66	59	41	10 U to 188	68 ± 7	28
Cyanide (ug/L)	5 U			0.006 to 74	14 ± 6.5	12
Turbidity (field) (NTU)	D3	D3	↓4.4	6.1 to 1733	460 ± 120	21

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

Q2= 4 - 2021

Q3= 7 - 2021

Q4= 10 - 2021

U = Not Detected above the laboratory reporting limit.

D3 = Sample too dark to take reading.

TDS = Total Dissolved Solids	Temp = Temperature	TKN = Total Kjeldahl Nitrogen
Tl = Thallium	TSS = Total Suspended Solids	TURB (fld) = Turbidity (field)
V = Vanadium	Water Depth = Water Level Depth	Water Elev. = Water Level Elevation
Well Depth = Well Depth	Zn = Zinc	

- Values below the laboratory PQL (non-detects) are divided by 2. All other data qualifiers are ignored but any associated value is used.

- Samples collected for data quality control are not analyzed.

- Data sets with less than 5 data points are not analyzed.

- Data sets with a period shorter than the intended period of analysis (e.g. 3-yr analysis or 5-yr analysis) are not analyzed.

- Significant events in historical data can affect the distribution in a way that compromises the assumption of a monotonic data set. Events could include the cessation of filtering, a spill, changing sampling protocols or analytical method changes that alter the detection limit.

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
!1 - The sampling location was damaged or destroyed, and has been discontinued.
M - Results are missing or not reliable due to a meter malfunction.
US - Not Detected above the reported reporting limit determined by interpreted instrument specification.

Landfill Gas Monitoring Evaluation

JUNIPER RIDGE LANDFILL

2021 ANNUAL GAS MONITORING EVALUATION

Operated by NEWSME Landfill Operations, LLC

2828 Bennoch Road, Old Town, Maine 04468 • (207) 394-4372

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

1.0 INTRODUCTION

In accordance with the Maine Department of Environmental Protection (MEDEP) Chapter 401, Solid Waste Management Rules, Section 401.4.D(4)(d), an evaluation of the gas monitoring results for Juniper Ridge Landfill's (JRL) past year, including a comparison of the past year's results to the previous year's results is provided below.

Throughout 2021, the following regular landfill gas (LFG) monitoring activities occurred at JRL: (1) well-tuning of LFG collection trenches and wells (well heads), (2) continuous flow and temperature measurement at the landfill gas combustion flare, and (3) landfill gas composition measurement during well-tuning activities at the landfill gas combustion flare.

Additionally, JRL is subject to 40 Code of Federal Regulations (CFR) Part 60 Subpart XXX (the New Source Performance Standards [NSPS] for Municipal Solid Waste [MSW] landfills) and the operational standards of 40 CFR Part 63 Subpart AAAA (the National Emission Standard for Hazardous Air Pollutants [NESHAP] for MSW landfills). Reports completed in accordance with NSPS requirements are submitted separately to the MEDEP Bureau of Air Quality.

On March 26, 2020, NESHAP Subpart AAAA was updated with changes required to take effect by September 2021. JRL began complying with the changes as of the issuance date of air emission license A-921-70-H-A (1/6/2021), including the increased default LFG operating temperature limit of 145 degrees Fahrenheit (°F).

2.0 WELL FIELD ACTIVITY

During 2021, well field activities consisted of the addition of new infrastructure, as well as discontinuing older infrastructure due to malfunction, insufficient methane production or redundancy. Anomalies associated with routine operation of the well field were also monitored. A summary is provided below.

2.1 Active, New, and Discontinued Well Heads

At the beginning of 2021, the JRL well field consisted of 173 active collection devices. During 2021, 11 gas collection trenches, 11 vertical wells, and 1 other collector was discontinued or replaced. Prior to discontinuing vertical wells, JRL first sought MEDEP approval. Prior to discontinuing gas collection trenches, which are designed as temporary collectors, JRL first notified MEDEP. Table 2-1 shows all well heads that were monitored during 2021, as well as their status as of the end of the year. By the end of 2021, 189 gas collection devices were active.

Table 2-1 Well Heads Monitored at JRL, 2021

ID	Type	Status	ID	Type	Status

2.2 *Changes and Anomalies in the Well Field*

The facility was operated in accordance with NSPS requirements during the entirety of 2021. As discussed in Section 2.1, numerous collection trenches and wells were added and discontinued throughout 2021 as part of routine operations. Readings in excess of NESHAP thresholds for temperature and pressure were promptly addressed, and follow-ups were completed in accordance with NESHAP requirements. Excess readings were provided in separate reports to the MEDEP.

Due to the types of waste currently/previously disposed of at JRL (primarily construction debris, construction debris processing residuals, sludge, and ash), which tend to have higher decomposition temperatures than typical household waste, operating some of JRL's well heads according to NESHAP guidelines (with default gas temperature of 145 °F (62.8 °C)) has not always been possible. With that in mind, upon careful review by JRL staff and the MEDEP, several Higher Operating Value (HOV) allowances have been granted for temperature, up to 150 °F, to allow for proper gas collection to occur at these locations. JRL will continue to submit HOV requests as necessary to ensure continued compliance and a successful operation.

3.0 LANDFILL GAS COMPOSITION

During well-tuning activities, the composition of the landfill gas supplied to the flare was measured and concentrations of methane, carbon dioxide, and oxygen (CH_4, CO_2, O_2 respectively), and balance gas were recorded. During 2021, JRL staff operated the well field with the intent of: maintaining a target methane concentration in the range of 40%-45% (by volume) in the gas supplied to the flare, for both odor control and greenhouse gas reduction; and maintaining an oxygen concentration at satisfactory low levels (i.e. < 5%) in order to maintain high efficiency in the vacuum system and prevent possible landfill complications associated with oxygen infiltration. Balance gas levels are also monitored, as a confirmation of landfill collection efficiency and oxygen infiltration prevention. The concentration of carbon dioxide at the flare is not of great concern but is measured in addition to the more important levels of methane and oxygen.

Since gas composition is not measured daily, monthly average gas compositions at the flare were computed from routine measurements that occurred during well-tuning activities. The monthly average concentrations of methane and oxygen are shown in Figure 3-1. As can be seen, the concentration of CH_4 remained within the target range of 40%-45% for a majority of 2021. The average CH_4 concentration for 2021 was 41.6%, a slight decrease from the 2020 average concentration of 42.1%. This variation is acceptable and likely attributable to changing landfill conditions. In efforts to improve gas quality for a future renewable natural gas project, a full time well tuner was hired in March of 2020. The average oxygen concentration during 2021 was 0.4%, similar to the 2020 average of 0.4%.

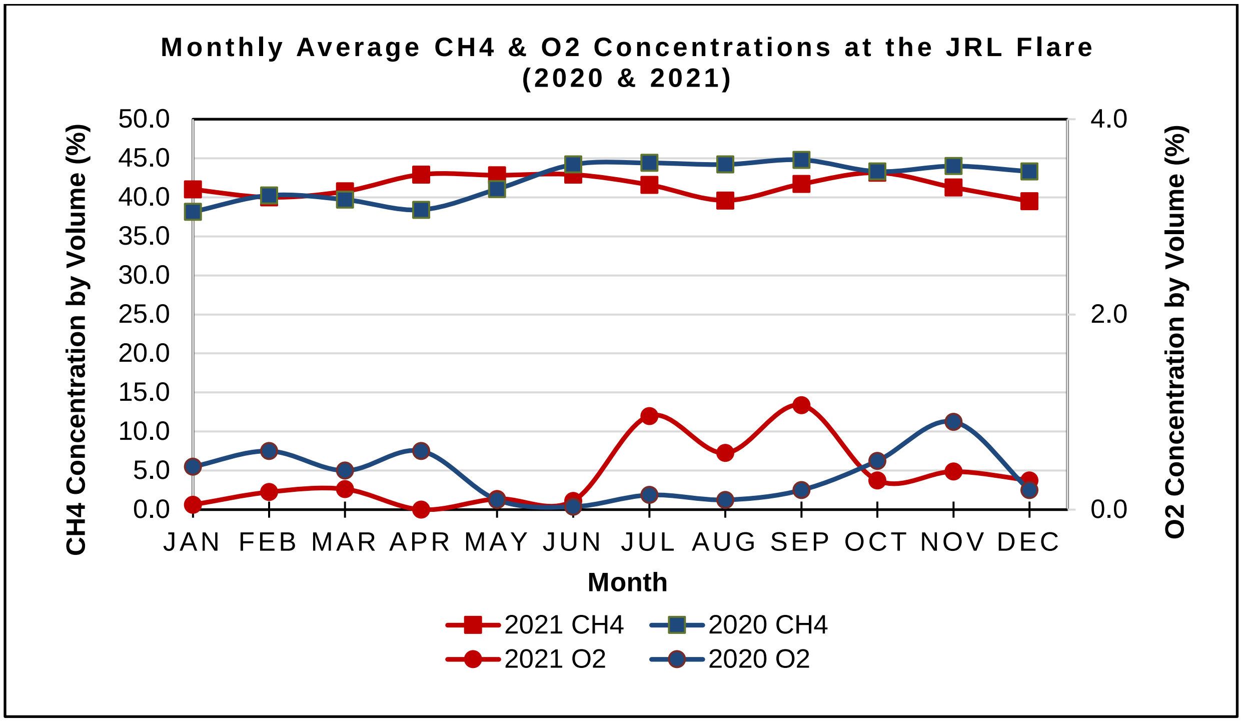

Figure 3-1 Monthly Average Landfill Gas Composition at JRL, 2020 & 2021

4.0 LANDFILL GAS FLOW

The flow of landfill gas supplied to the JRL flare and the Thiopaq® gas treatment system was measured and recorded on a continuous basis using a thermal flow meter. This data was then compiled for 2021 (and 2020 for comparison) and is summarized as total monthly flow and average flow in Table 4-1 and Figure 4-1. The average flow rate was calculated by taking the total monthly flow (in units of MMSCF)/(number of days in the month*1440 minutes/ 1 day). The result is an average flow rate (in units of SCFM) for any given month.

The total flow during 2021 was 1,283 million standard cubic feet (MMSCF), an increase of approximately 39% from total flow of 921 MMSCF in 2020. This significant increase is likely attributed to changes in waste mix and the addition of a full time well tuner whose goal is to improve gas quality and promote a healthy atmosphere for methanogenic producing bacteria to flourish.

Table 4-1 Volumetric Flow of Landfill Gas at JRL, 2020 & 2021

	Total Monthly Flow (MMSCF)		Average Flow Rate (SCFM)

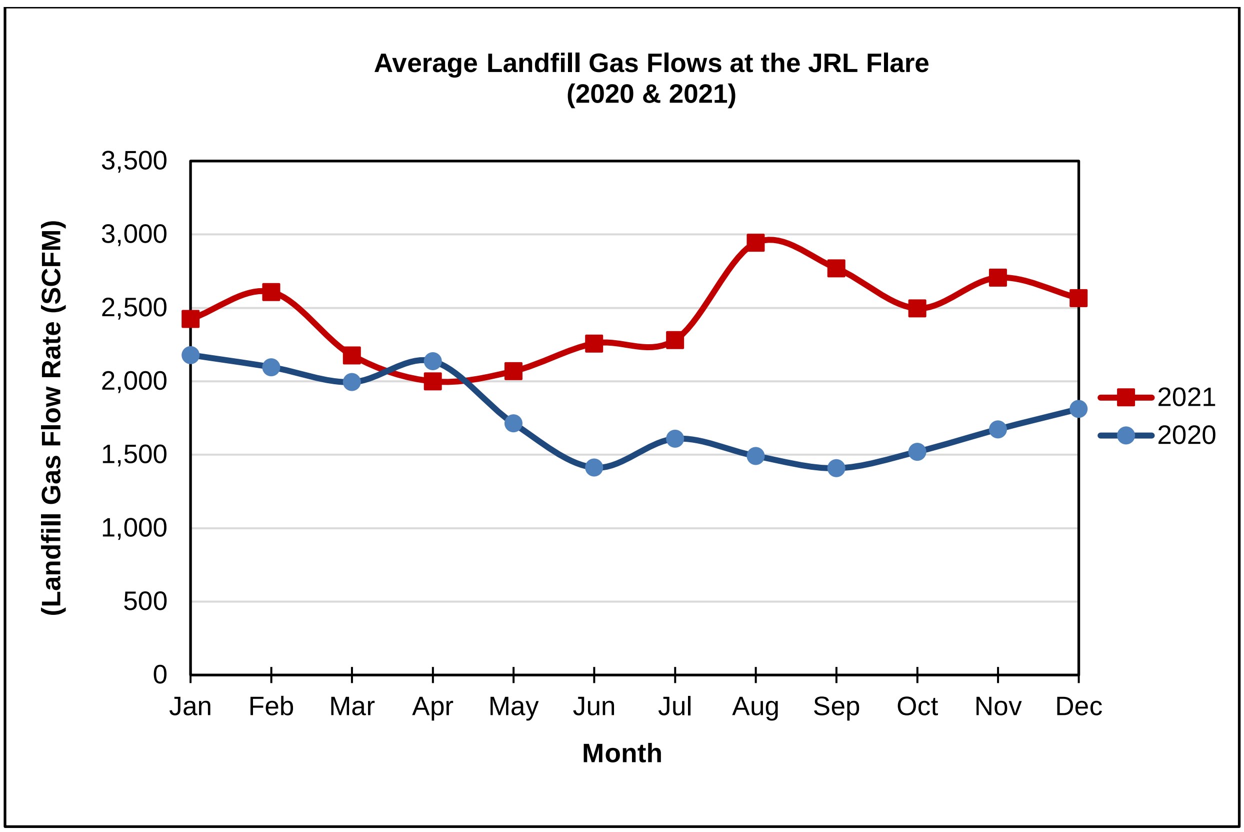

Figure 4-1 Monthly Average Landfill Gas Flow Rate at JRL, 2020 & 2021

5.0 ENERGY GENERATED BY METHANE COMBUSTION

JRL has a candlestick type flare which burns the methane (CH_4) present in the landfill gas. Methane has an approximate heating value of 1,005 BTU/SCF (BTU per standard cubic foot). Using this heating value, along with the methane concentrations and landfill gas flows presented in the previous sections, the energy generated by the combustion of methane in the JRL flare was calculated.

Table 5-1 shows the monthly totals of energy generated by CH_4 combustion, along with the average daily combustion energy for 2020 and 2021. Figures 5-1 and 5-2 further portray LFG energy combustion during its destruction through the use of the flare. The calculated total energy converted to heat by combustion at JRL during 2021 was approximately 535,088 MMBTUs, compared to approximately 387,003 MMBTUs in 2020, an increase of approximately 38%. This change is a direct result of higher gas flows which is further described in Section 4.0.

Table 5-1 Energy Generated by CH_4 Combustion at JRL, 2020 & 2021

	Monthly Total (MMBTUs)		Daily Average (MMBTUs/day)	
Month	**2020**	**2021**	**2020**	**2021**
January	37,297	44,593	1,203	1,438
February	34,188	42,267	1,179	1,510
March	35,524	39,805	1,146	1,284

Average			**1,058**	**1,467**

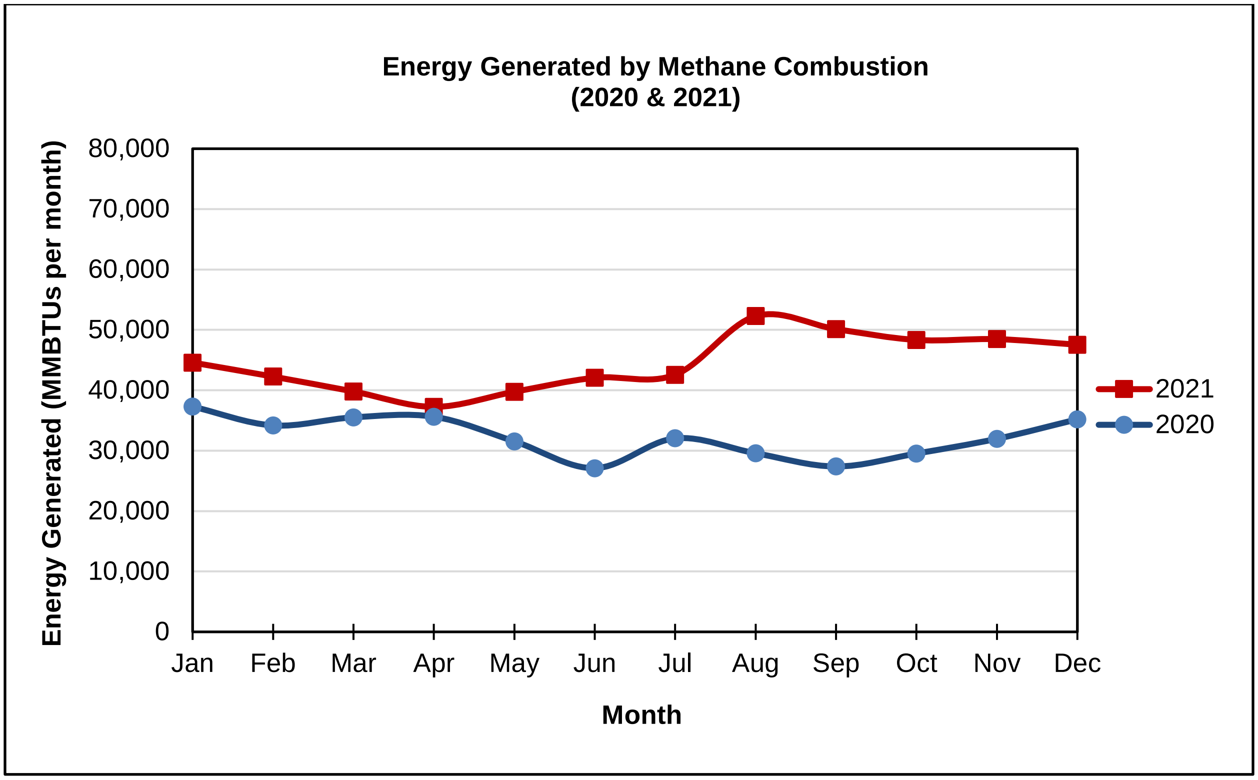

Figure 5-1 Energy Generated by CH4 Combustion at the JRL Flare, 2020 & 2021

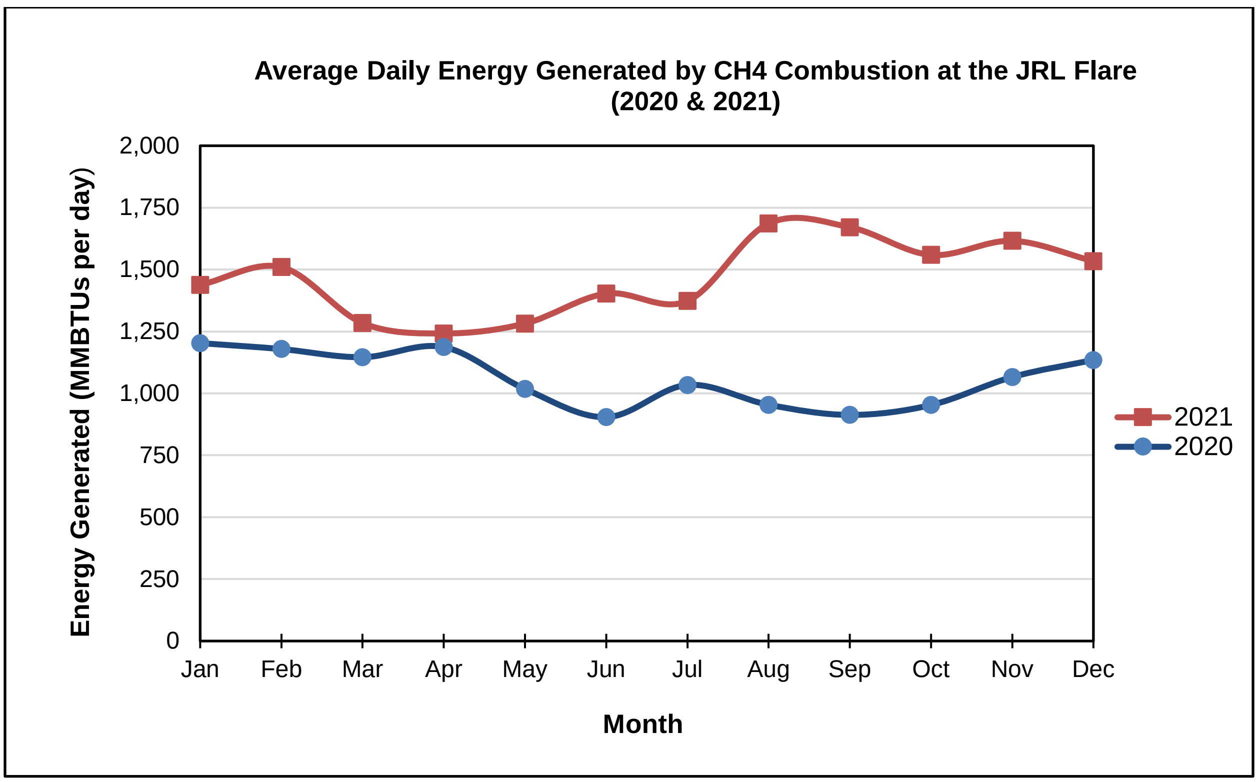

Figure 5-2 Avg. Daily Energy Generated by CH_4 Combustion at the JRL Flare, 2020 & 2021

6.0 SUMMARY

Throughout 2021, routine landfill gas (LFG) monitoring took place at various on-site gas management locations in accordance with NESHAP requirements, with results being submitted via electronic deliverable document to the MEDEP as required. At the beginning of 2021, the JRL well field consisted of 173 active collection devices. At the end of 2021, 189 collection devices remained active.

The average CH_4 concentration for 2021 was 41.6%, a slight decrease from the 2020 average concentration of 42.1%. This variation is acceptable and likely attributable to changing landfill conditions. In efforts to improve gas quality for a future renewable natural gas project, a full time well tuner was hired in March of 2020. The average oxygen concentration during 2021 was 0.4%, similar to the 2020 average of 0.4%.

The total flow during 2021 was 1,283 million standard cubic feet (MMSCF), an increase of approximately 39% from total flow of 921 MMSCF in 2020. This significant increase is likely attributed to changes in waste mix and the addition of a full time well tuner whose goal is to improve gas quality and promote a healthy atmosphere for methanogenic producing bacteria to flourish.

The calculated total energy converted to heat by combustion at JRL during 2021 was approximately 535,088 MMBTUs, compared to approximately 387,003 MMBTUs in 2020, an increase of approximately 38%. This change is a direct result of higher gas flows.

Landfill Air Monitoring Evaluation

JUNIPER RIDGE LANDFILL

2021 ANNUAL AIR MONITORING EVALUATION

Operated by NEWSME Landfill Operations, LLC

2828 Bennoch Road, Old Town, Maine 04468 • (207) 394-4372

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

1.0 INTRODUCTION

In accordance with the Maine Department of Environmental Protection (MEDEP) Chapter 401, Solid Waste Management Rules, Section 401.D(4)(e), NEWSME Landfill Operations, LLC evaluated the 2021 air monitoring results, including a comparison of the 2021 results to the previous year's results. Two types of air monitoring activities occurred at the Juniper Ridge Landfill (JRL) during 2021; (1) hydrogen sulfide (H_2S) monitoring at stationary continuous monitors; and (2) quarterly methane (CH_4) emission surface scans on the landfill's intermediate cover. The air monitoring was completed in general accordance with the procedures specified in the current JRL operations manual.

H_2S monitors are Honeywell® Analytics MDA Single Point Monitors (SPM) utilizing EP hydrides Chemcassettes® also provided by Honeywell®. Readings were taken at 15-minute intervals and data-logged. Monitors are located at four different off-site locations surrounding the landfill as shown in Figure 1-1.

Figure 1-1 Juniper Ridge Landfill H_2S Single Point Monitoring Locations

Methane scans were completed using a MicroFID® (flame ionizing detector) or similar mobile device (QED SEM-5000) and completed once every quarter by taking measurements along an approximate 30-meter spacing grid on the intermediate cover system. Measurements were also collected at cover penetrations in the pattern (i.e. gas collection piping, etc.) and at noticeable punctures, cracks, or holes in the intermediate cover.

Additionally, odor complaints from the 24-hour JRL odor complaint hotline for 2021 were summarized and compared to 2020 results.

2.0 STATIONARY H_2S MONITORING RESULTS

Using the four Honeywell Analytics SPMs located off-site (on the access road, West Coiley Road, 552 West Old Town Road (Route 43), and Old Stagecoach Road), real-time data is collected and recorded at 15-minute intervals. If at any time off-site monitors detect concentrations greater than 15 parts per billion (ppb), then scale house personnel are alerted by automated telephone messages. Personnel then report any alert to supervisory staff, who are responsible for reporting H_2S readings greater than 15 ppb in the facility's Monthly Status Report and to the Old Town Code Enforcement Officer if H_2S levels exceed 30 ppb.

The Honeywell Chemcassette® tapes utilized in the SPMs at JRL are capable of continuously detecting hydrogen sulfide levels down to 2 ppb and quantitatively measuring down to 4 ppb. The quantitation limit (4 ppb) is the lowest numerical value that can be determined with suitable precision and accuracy and the detection limit (2 ppb) is the lowest numerical value that can be reasonably estimated by the instrument (typically half the quantitation limit). The summarized data provided below is an average of readings, including non-detect (values less than 2 ppb) readings taken at each instrument, therefore the average values (monthly and annually) are typically less than the detection limit of the Chemcassettes®.

In 2021, data logged readings, along with SPM maintenance records and associated weather data from an on-site weather station were provided to the MEDEP on a periodic basis. SPM maintenance includes Chemcassette® change outs, which generally occur every 6 weeks, along with recommended maintenance performed by the manufacturer.

The annual average H_2S calculated values at the Access Road, 552 West Old Town Road, the Old Stagecoach Road, and the West Coiley Road SPMs are presented in Table 2-1 & Figure 2-1. Due to the vast number of non-detect readings, also known as zero readings, the average H_2S values for all four meters were below the detection limit of 2 ppb for both 2020 and 2021.

Table 2-1 Annual SPM H_2S Averages, 2020 & 2021

Juniper Ridge Landfill 2021 Annual SPM H_2S Averages					
Location	Bangor Wind Rose %¹	Bangor Wind Rose % plus 50% calm²	Non-Detect Readings	Average in ppb (Non-Detect = 0 ppb)	Average in ppb (Non-Detects = 1 ppb³)
Access Road	11.5%	19.8%	27,525	0.290	0.383
552 West Old Town Road	3.6%	11.9%	32,169	0.086	0.205
Old Stagecoach Road	6.0%	14.3%	32,939	0.084	0.175
West Coiley Road	15.0%	23.3%	31,911	0.150	0.307
Total Number of Readings in 2021: 33921					
Juniper Ridge Landfill 2020 Annual SPM H_2S Averages					
Location	Bangor Wind Rose %¹	Bangor Wind Rose % plus 50% calm²	Non-Detect Readings	Average in ppb (Non-Detect = 0 ppb)	Average in ppb (Non-Detects = 1 ppb³)
Access Road	12.6%	20.6%	33,772	0.006	0.131
552 West Old Town Road	3.5%	11.5%	32,722	0.086	0.120
Old Stagecoach Road	7.1%	15.1%	32,705	0.074	0.143
West Coiley Road	14.5%	22.5%	32,490	0.101	0.249
Total Number of Readings in 2020: 33,814					

¹ *Bangor Wind Rose percentage of time wind in direction of SPM.*
² *Bangor Wind Rose percentage of time wind in direction of SPM plus 50% of Calm.*
³ *Used 1 ppb instead of 0 for non-detect readings when the wind was in the direction of meter and 50% of time when the wind was calm; percentages are shown for each SPM in the second column.*

In addition, the annual average H_2S values at these meters were also calculated using the most recent local wind direction and duration data from the Bangor International Airport Weather Station. Non-detect readings were replaced with a conservative estimate of half the detection limit of the SPM's, 1 ppb, for the percentage of time wind was in the direction of each meter, along with half of the total calm wind rose data. This data evaluation technique was developed in cooperation with the City of Old Town during the review of the JRL Expansion Application. These results are also presented in Table 2-1 and shown in Figure 2-2.

When comparing the 2020 and 2021 Annual SPM H_2S averages of the four SPMs located around JRL, all four SPMs saw an increase during 2021. This was likely attributed to the change in waste mix and the greater volumes of sludge accepted at the site throughout the year. Although an increase was noticed, the average off-site H_2S levels remained very low during both 2020 and 2021. Monthly average H_2S calculated values for each location are shown in Figures 2-3 through 2-6 and should be used for comparative analysis only due to their low averages, below the quantitative and detection limits of the instruments. These averages were plotted via a simple average of the monthly readings, non-detect (zero) readings were not edited.

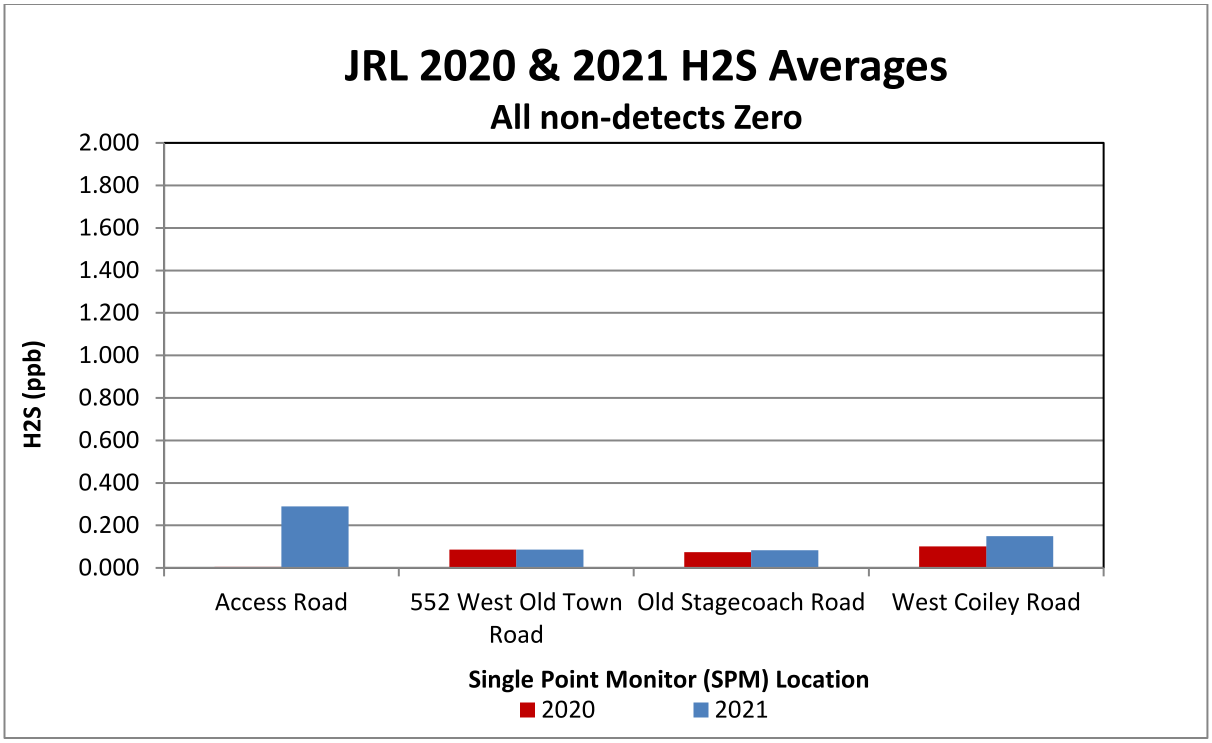

Figure 2-1 Annual Avg. H_2S readings at all four SPM locations, 2020 & 2021

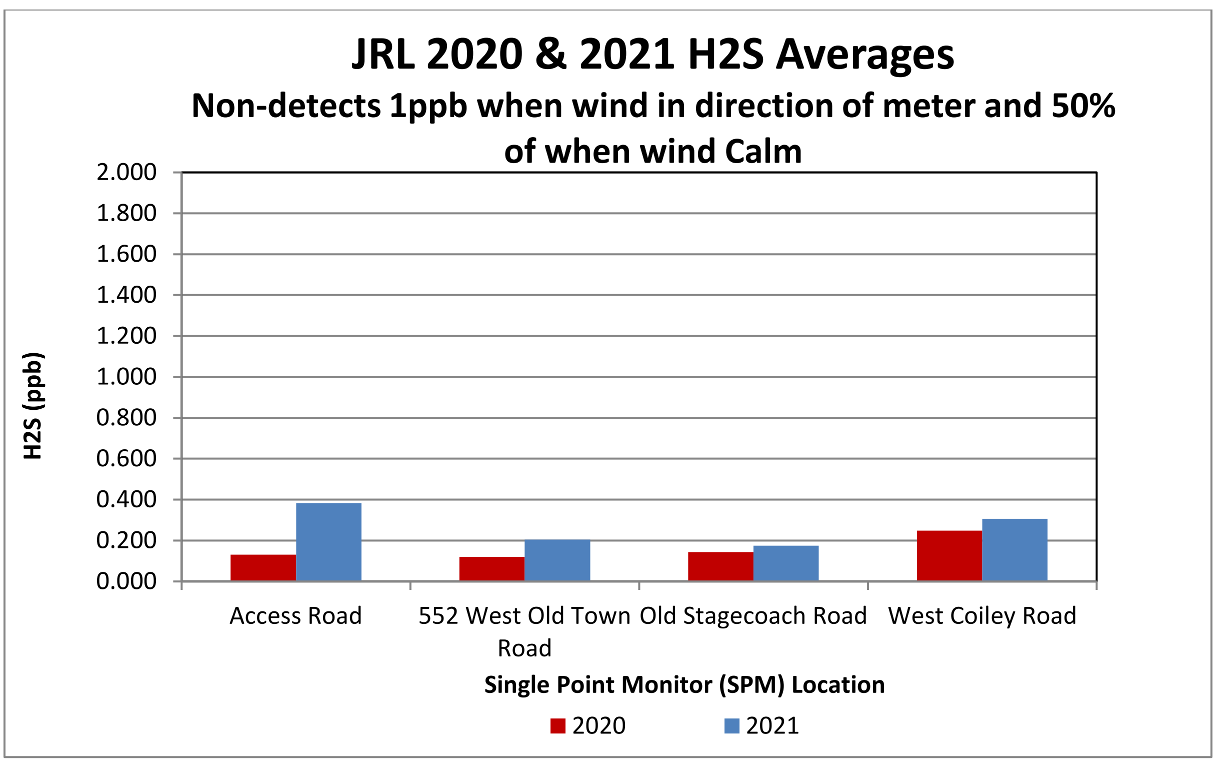

Figure 2-2 Annual Avg. H_2S readings at all four SPM locations with percentages of non-detects at 1 ppb based on wind rose data, 2020 & 2021

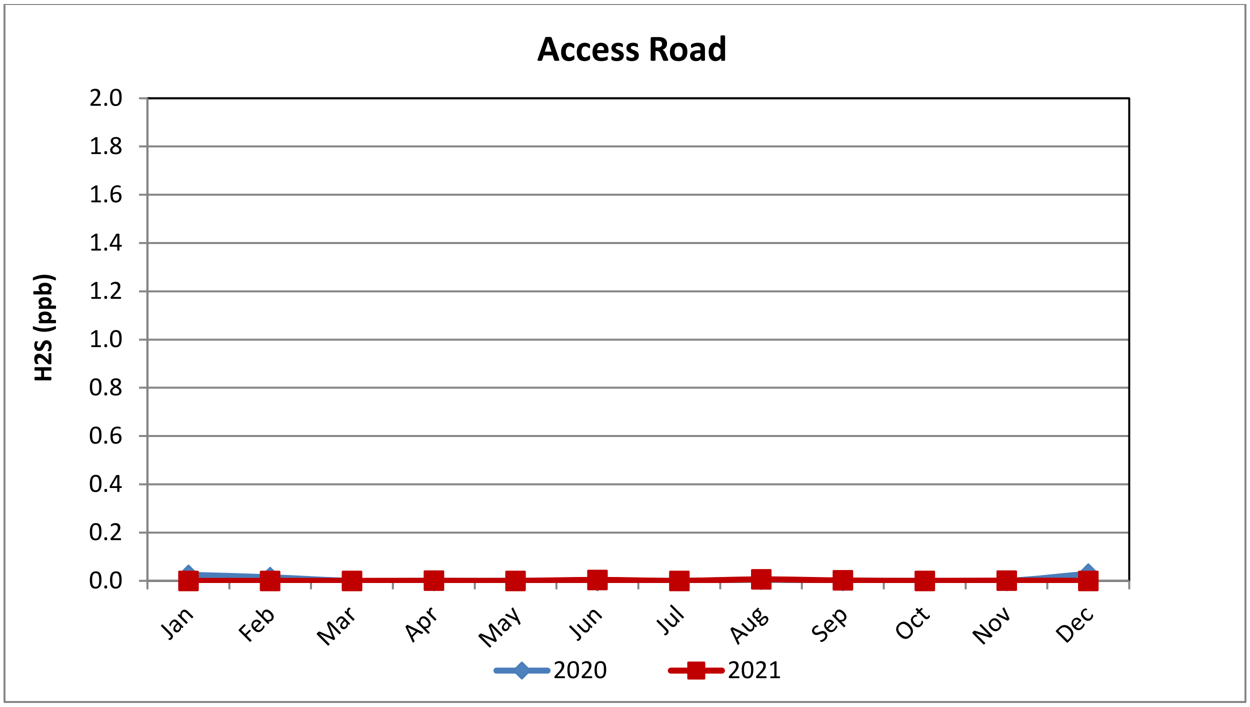

Figure 2-3 Monthly Avg. H_2S readings at the Access Road SPM, 2020 & 2021

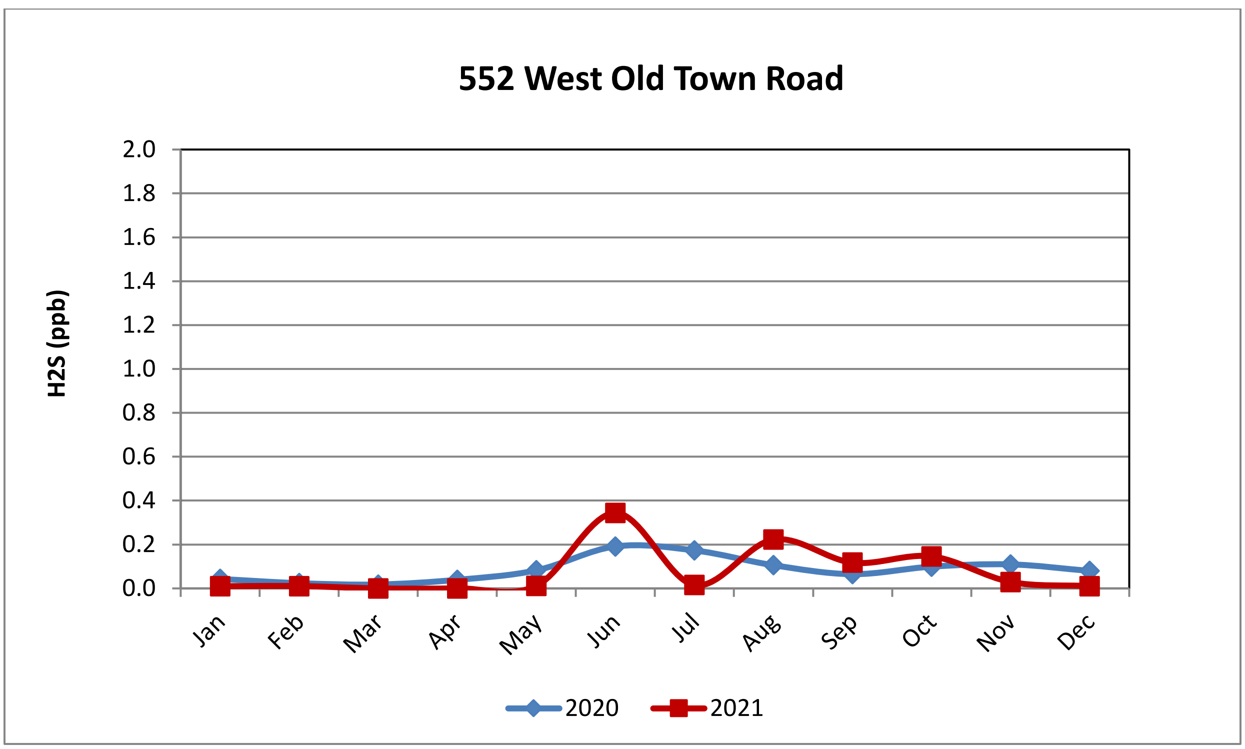

Figure 2-4 Monthly Avg. H_2S readings at the 552 West Old Town Road SPM, 2020 & 2021

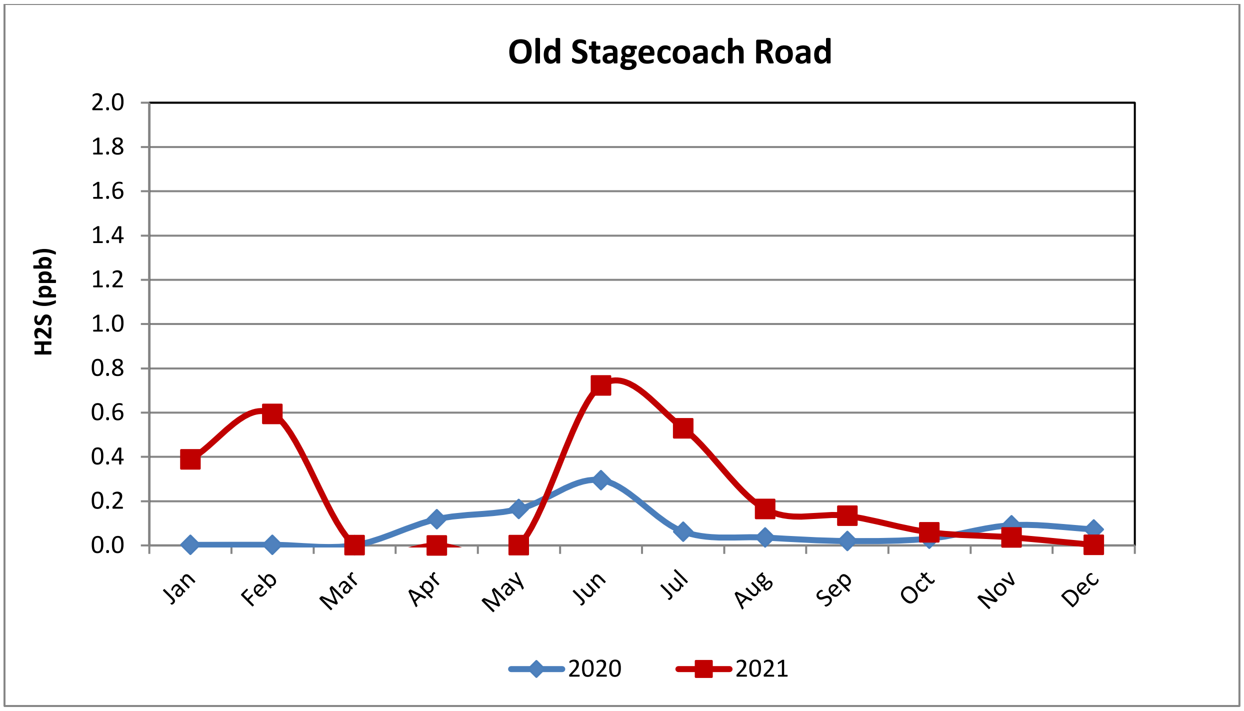

Figure 2-5 Monthly Avg. H_2S readings at the Old Stagecoach Road SPM, 2020 & 2021

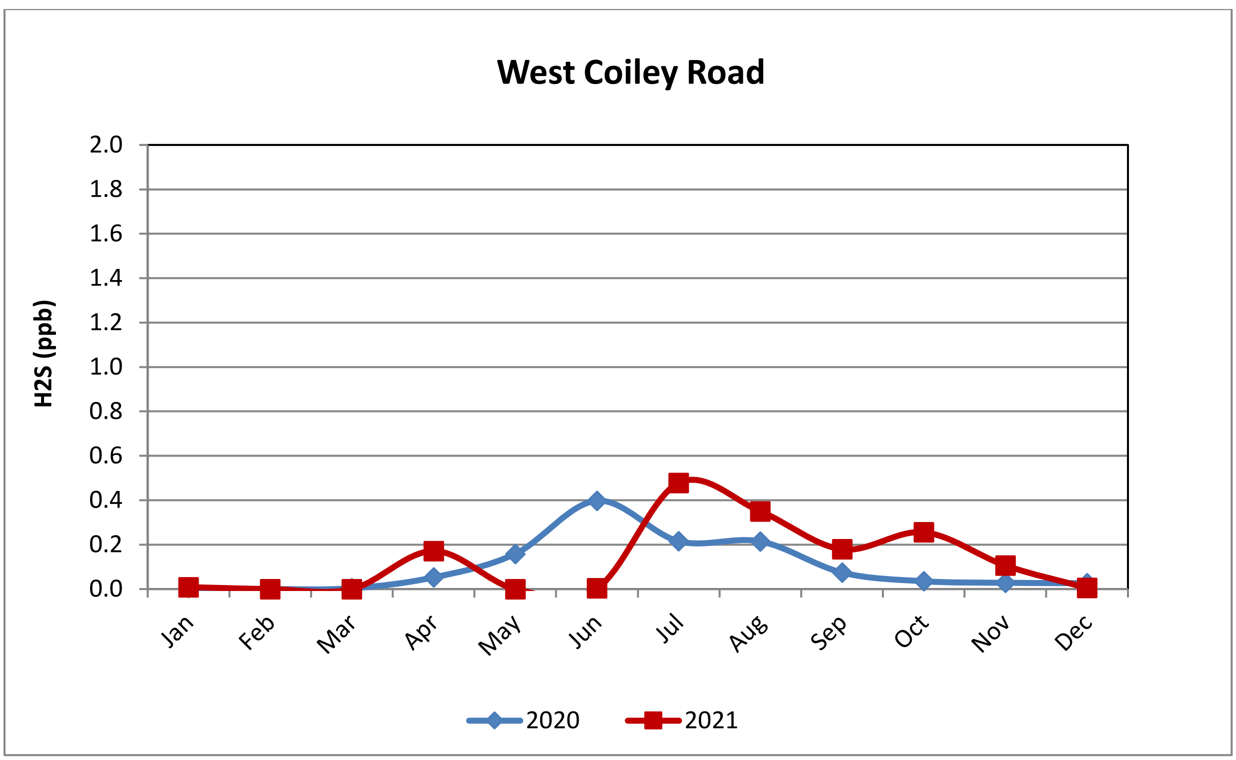

Figure 2-6 Monthly Avg. H_2S readings at the West Coiley Road SPM, 2020 & 2021

Instantaneous peak readings were identified during 2021 and 2020, to determine if any short duration H_2S episodes occurred. They are provided below in Table 2-2.

Table 2-2 Annual highest two readings at each SPM, 2020 & 2021

Juniper Ridge Landfill					
Hydrogen Sulfide Single Point Monitor					
Highest Two Annual Readings					
Year	Location	Date	Highest Reading (ppb)	Date	2nd Highest Reading (ppb)
2021	Access Road	12/20/2021 17:30	6.12	5/14/2021 3:10	5.78
2021	552 West Old Town Road	12/30/2021 9:32	9.68	1/11/2021 19:07	9.23
2021	Old Stagecoach Road	6/29/2021 0:54	10.57	3/22/2021 0:24	10.23
2021	West Coiley Road	03/22/2021 19:27	16.40	1/7/2021 16:08	10.90
2020	Access Road	12/19/2020 20:46	11.57	12/19/2020 21:01	8.90
2020	552 West Old Town Road	7/28/2020 17:39	11.68	12/6/2020 10:23	10.35
2020	Old Stagecoach Road	12/6/2020 12:38	23.03	9/30/2020 16:59	7.12
2020	West Coiley Road	8/4/2020 12:07	15.91	1/6/2020 8:41	9.46

Throughout 2021, there was one H_2S readings above 15 ppb, at the four off-site SPM's. This compares to two reading above 15 ppb during 2020. The MEDEP was notified of the occurrence, which were also noted as required in the JRL Monthly Status Report. On site landfill gas management systems continue to function well in preventing off-site migration of H_2S.

The one elevated H2S reading was 16.4 ppb on March 22nd, 2021 at 7:27 pm. This occurred at the West Coiley Road SPM. Facility personnel were not able to identify any operational problems in the landfill that could have contributed to this high reading and no unusual odors were detected at the time. No apparent problems were identified with the meter itself. However, another relatively high H2S readings was observed earlier that day at the Old Stagecoach Road SPM, leading JRL Staff to believe it may have been actual.

3.0 ODOR COMPLAINTS

Complaints recorded via the 24-hour JRL complaint hotline are provided for 2021 and 2020 in Table 3-1 below. Detailed complaint logs were submitted as part of the facility's monthly reports to the MEDEP during 2021. During the year, the JRL complaint hotline received a total of 23 landfill related complaints. 22 complaints were odor related and 1 was noise related. This is an increase from the 19 landfill related complaints for 2020, 15 of which were odor related. 21 of the 22 odor complaints were confirmed as likely coming from the landfill. Odor complaints were logged as they occurred.

Site visits were conducted at the location of complaint if requested, to allow for validity of all complaints. Close attention was paid to complaints, which helped determine operational effectiveness of all odor control measures and/or systems. Changes were made to those measures and/or systems as necessary.

In 2021, eleven different individuals called in the 22 odor complaints. This is an increase from nine individuals who called in 15 odor complaints during 2020.

Table 3-1 Summary of Complaints at Juniper Ridge Landfill, 2020 & 2021

2021	OBJECT OF COMPLAINT						MONTH TOTAL
MONTH	ODOR	NOISE	LIGHTS	DUST	BIRDS	OTHER

4.0 CH_4 SURFACE SCANS

Landfill methane (CH_4) emission surface scans are performed to determine the effectiveness of intermediate landfill cover and landfill gas collections systems in controlling landfill gas migration. Quarterly surface scans were completed on the landfill intermediate cover at JRL during 2021 in accordance with the JRL Operations Manual and the requirements of the New Source Performance Standards (NSPS) for municipal solid waste (MSW) landfills contained in 40 Code of Federal Regulations (CFR) Part 60, Subpart WWW. Copies of the 2021 surface scans are kept on file and uploaded to Sanborn Head and Associates' Landfill Gas Management Suite (LFGMS).

Surface scans were completed in general accordance with the procedures outlined in NSPS, specifically Section 60.753(d) which states that each owner or operator of an MSW landfill with a gas collection and control system shall:
"Operate the collection system so that the methane concentration is less than 500 parts per million above background at the surface of the landfill. To determine if this level is exceeded, the owner or operator shall conduct surface testing around the perimeter of the collection area and along a pattern that traverses the landfill at 30 meter intervals and where visual observations indicate elevated concentrations of landfill gas, such as distressed vegetation and cracks or seeps in the cover. The owner or operator may establish an alternative traversing pattern that ensures equivalent coverage…"

Surface scans were completed using a MicroFID® (flame ionizing detector) or similar device (QED SEM-5000 portable methane detector, which NEWSME purchased in 2019). The MicroFID® device has a detection limit of 0.5 parts per million (ppm) and a concentration range of 0.5 to 50,000 ppm, while the QED SEM-5000 portable methane detector has the same detection limit but has a concentration range of 0.5 ppm to 100% methane. During 2021, a total of 12 readings above 500 ppm were detected during initial quarterly surface scans, compared to 9 which were detected during 2020. A quarterly breakdown is provided in Table 4-1. These readings and their locations have been documented, copies have been provided to the site supervisor, and necessary corrective actions have been taken. Follow-up was performed 10 days and 30 days after the initial reading in excess of 500 ppm or any subsequent reading in excess of 500 ppm.

Table 4-1 Readings above 500 ppm found during CH_4 Surface Scans, 2020 & 2021

Surface Scan Readings above 500 ppm					
	Q1	Q2	Q3	Q4	TOTAL
2021	3	2	2	5	12
2020	0	1	5	3	9

All areas with readings above 500ppm were resolved on the first initial rescan and follow-up. These results demonstrate the effectiveness of the synthetic and soil intermediate cover system. Damage to cover boots for the gas extraction piping due to landfill consolidation and settlement continue to be the primary cause of readings above 500 ppm. These damages are repaired as soon as practical.

5.0 SUMMARY

Two types of air monitoring activities occurred at the Juniper Ridge Landfill (JRL) during 2021; (1) hydrogen sulfide H_2S monitoring with stationary continuous monitors and, (2) quarterly methane emission surface scans on the landfill intermediate cover.

When comparing the 2020 and 2021 Annual SPM H_2S averages of the four SPMs located around JRL, all four SPMs saw an increase during 2021. This was likely attributed to the change in waste mix and the greater volumes of sludge accepted at the site throughout the year.

Throughout 2021, there was one H_2S readings above 15 ppb, at the four off-site SPM's. This compares to two reading above 15 ppb during 2020. The MEDEP was notified of the occurrence, which were also noted as required in the JRL Monthly Status Report. On site landfill gas management systems continue to function well in preventing off-site migration of H_2S

During the year, the JRL complaint hotline received a total of 23 landfill related complaints. 22 complaints were odor related and 1 was noise related. In 2021, eleven different individuals called in the 22 odor complaints.

During 2021, a total of 12 readings above 500 ppm were detected during methane surface scans. This is compared to 9 which were detected during 2020. Most of these readings occurred around landfill intermediate cover penetrations and were promptly corrected. Follow-up readings confirmed the issues were resolved.

A corporation providing hydrogeotechnical consulting services for engineering and environmental applications.

EXECUTIVE SUMMARY

This 2021 Annual Landfill Geotechnical Monitoring Report for the Juniper Ridge Landfill (JRL) summarizes the geotechnical conditions of the facility over the past year. These conditions were ascertained from monitoring that was performed to assure that the field behavior of the landfill continues to be consistent with parameters and assumptions used in the facility design. This report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application (SME 2015a) for a new solid waste license, as approved by the Board of Environmental Protection under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017.

The geotechnical monitoring at JRL during 2021 emphasized weekly stability and settlement observations of the landfill surface made during operations, and an independent geotechnical inspection of the landfill surface and slope topography conducted on August 30, 2021. Other specific monitoring activities in 2021 included: (a) comparisons of semi-annual topographic surveys, (b) review of waste types, quantities, and location of waste placement, and (c) evaluation of fluid pressure data measured by an electronic transducers placed on the base of Cells 11 & 12 to indicate the leachate head on the liner and to track whether or not the leachate collection system performance is consistent with design assumptions.

This document supplements previous monitoring reports made through 2010 (REW 2005a, 2006, 2007a, 2008a, 2009, 2010), and subsequent landfill inspection reports from the last eleven years (REW 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, and 2021). All monitoring data indicates that settlement and stability of the landfill waste is consistent with design parameters and assumptions. Information provided by the Cell 11 & 12 transducers demonstrate that the fluid levels in the leachate collection layer are at minimal levels, verifying that this drainage layer is performing as designed. No changes to the Geotechnical Monitoring Plan are proposed for geotechnical monitoring during 2022.

2021 Annual Landfill Geotechnical Monitoring Report
Juniper Ridge Landfill Facility
Old Town, Maine

1. INTRODUCTION

This 2021 Annual Landfill Geotechnical Monitoring Report has been prepared for the State of Maine's Juniper Ridge Landfill (JRL), a facility that is owned by the State of Maine Bureau of General Services (BGS) and operated by NEWSME Landfill Operations, LLC. (NEWSME), a subsidiary of Casella Waste Systems Inc. (CWSI). The landfill site plan (Figure 1), is based on an aerial topographic survey performed on June 24, 2021.

This report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application (SME 2015a,b) for a new solid waste license, as approved by the Board of Environmental Protection under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017. This report presents the results of this monitoring that verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2021).

2. HISTORY OF LANDFILL DEVELOPMENT & MONITORING

JRL was initially developed by Fort James Operating Company (FJC), a subsidiary of Georgia-Pacific Corporation, for its private use in the disposal of treatment plant sludges and other wastes from its mill in Old Town, Maine. In 2004, the State of Maine, through the State Planning Office (SPO), agreed to purchase the landfill for disposal of other approved in-state wastes including: construction and demolition debris (CDD), oversized bulky waste (OBW), front end processing residue (FEPR), ash from waste incinerators, other ashes from industrial incinerators, bypass municipal solid waste (bypass MSW), and other miscellaneous wastes. This section discusses the history of landfill development at the site.

2.1 Fort James Operation

Approximately 68 acres of a 780-acre property was licensed by FJC as a secure landfill, and operated by FJC from 1996 until 2004 when the State of Maine purchased the landfill. During this period, JRL, then called the West Old Town Landfill (WOTL), was used mainly for disposal of combined sludge from FJC's primary and secondary treatment plant in Old Town and fly ash from a biomass boiler at Eastern Paper's mill in Lincoln. Placement of the sludge began in December 1996 along the western portion of Cell 1. By 2001, operations had moved to the east into Cell 2. Details relating to the geotechnical behavior of FJC's sludge during the sequential landfill development is presented in previous reports (REW 2007a,b).

		Client: State of Maine BGS/NEWSME Landfill Operations LLC, Old Town, Maine	Scale: ~1" = 500'	

2.2 State of Maine Purchase and Operations

In February 2004, the State of Maine, through the SPO, purchased the landfill from FJC. It selected CWSI through its subsidiary NEWSME, to operate the disposal of in-state wastes. Approximately 50,000 tons of sludge from FJC's Old Town mill were initially placed in landfill Cells 1 & 2 before the mill closed in 2006. To improve deposit stability, CWSI stabilized the existing sludge at the site by mixing it with approved in-state waste streams, i.e. CDD, OBW, FEPR, incinerator ash, bypass MSW, and other miscellaneous wastes. A detailed description of the test plots constructed to determine the geotechnical behavior of this waste and the sludge stabilization program were presented in previous annual monitoring reports (REW 2005a, 2006, 2007a, 2008a, 2009, 2010, 2011) and an annual geotechnical landfill inspection report (REW 2012).

Once the sludge stabilization program was completed by mid-2006, landfill operations moved into Cell 3A/B, followed sequentially with Cells 4-10 under MEDEP Solid Waste License #S-020700-WD-N-A. Deposited in these cells was a mixture of in-state wastes, which included but not limited to various percentages of CDD, MSW (Cells 3-10 only), bypass MSW, OBW, MSW incinerator ash and other ashes, CDD wood fines for cover, contaminated soils, WWTP/POTW sludge, lime mud and grit, oil spill debris, pulp mill waste, other approved miscellaneous special wastes.

In mid-2015, with the help of SME, BGS/NEWSME submitted JRL Expansion Application (SME 2015a,b) to the MEDEP. On June 6, 2017, that application was approved by the BEP under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N. During 2018, the first cell (Cell 11) of a 6-cell, 54 acre landfill expansion was constructed. As a result, a mixture of similar in-state wastes as described above for Cells 3-10, (excluding MSW for Expansion Cells 11-16) was approved. Based on performance to date, this mixture of wastes are stable at slopes up to 2.5H:1V. While the mixture from these waste streams are still highly compressible and subject to gas generation, , the in-state waste mixture is more stable and less compressible than the waste-stabilized sludge based on more than 13 years of operational experience.

2.3 Overview of Past Geotechnical Monitoring

Once the stability of the waste-stabilized sludge was resolved (see MEDEP 2008; REW 2008b; *2008 GMR*, REW 2009; *2010 GMR*, REW 2011), the previous program (REW 2007b) was modified to represent the monitoring needs associated with current waste mixtures placed in a landfill founded on a firm soil (see *2011 GMR*, REW 2012). Specifically, reliance on the extensive measurements of in-situ instruments was shifted to observation methodologies that are used to assure that the geotechnical performance of the landfill remained consistent with design analyses. This approach has been in service since 2010 and now applied to the most recent GMP included in the JRL Expansion Operations Manual (NEWSME 2021).

3. 2021 WASTE PLACEMENT AND OPERATION

In 2021, waste was placed in the limited remaining landfill capacity in Cells 1-11 and in Cell 12 while Cell 13 was constructed for future use. (see Appendix F site photos #19 – 24). As summarized in Appendix A herein, waste composition during this period was dominated by forms of CDD, MSW (Cells 3-10 only), bypass MSW, OBW, MSW incinerator ash and other ashes, CDD wood fines for cover, contaminated soils, WWTP/POTW sludge, oil spill debris, pulp mill waste, other approved miscellaneous special wastes. By mid-year (when the aerial photography was made), approximately 100 feet of the mixed waste was placed in Cell 12, raising its grade to a maximum elevation of approximately 310 ft. mean sea level (msl). Wastes placed over the southeast top of the landfill (i.e. Cells 7 to 11) raised the by approximately 50 feet to a maximum elevation of about 390 ft. msl. As the final capacity in Cell 12 was exhausted, waste placement was moved into Cell 13 in September of 2021.

The remaining landfill capacity in Cells 1-13 at the end of 2021 is summarized in Appendix B. As the capacity of Cell 13 is exhausted, expansion will continue in four additional landfill cells (i.e. Cells 14 to 17) located north of the existing operations. It is expected that future expansion cells will receive similar types and quantities of wastes placed in previous years during the operation of Cells 11 through 13.

4. 2021 GEOTECHNICAL LANDFILL MONITORING

During 2021, various monitoring was performed at JRL to ensure compliance with JRL's Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N. Results of this monitoring verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2021). Specifically, geotechnical monitoring during this past year included: (1) visual observation of landfill slope stability, settlement, and general landfill conditions, (2) assessment of site aerial topographic surveys; (3) a review of waste types, quantities, location of waste placement, and filling sequences, and (4) evaluation of fluid levels in the leachate collection layers of Cell 11 and Cell 12.

4.1 Landfill Observations

During 2021, performance of JRL was verified by routine weekly visual site inspections of the landfill during normal operations. A sample copy of the weekly/monthly inspection forms is presented in Appendix C (with copies of any specific inspection available upon request). Observations made during these inspections help confirm the corroboration of landfill performance with the design conditions used in the geotechnical analysis. In part, the revised stability and settlement analyses completed for the landfill design (REW 2005b, SME 2015b) were verified in the field by monitoring the type, quantity, rate, location, and condition of waste placement in accordance with the JRL Expansion Operations Manual (NEWSME 2021).

4.2 Annual Inspection

To supplement weekly operational observations, an annual geotechnical inspection of the landfill area (performed on August 30, 2021) focused on the overall condition of the landfill that specifically looked for evidence of cracking, localized depressions, erosion, leachate breakout on sideslopes, areas of ponded water, stressed vegetation, and toe heaving. As previously mentioned, normal operations were taking place in Cell 12 while additional grading material was placed on the top of the landfill in the southeast portion of Cells 7/9/10. Synthetic Intermediate Cover Material (SICM) and, in small areas, earthen intermediate cover has been placed over the inactive portions of the landfill.

Geotechnical observations were made to confirm that waste placement procedures, sideslope construction, cover performance, and other construction/filling practices are consistent with the JRL Expansion Operations Manual (NEWSME 2021). An observation report, using the checklist presented in the current GMP, was filled out and is included in Appendix D of this report.

Inspection elements for assessment of geotechnical performance included:

Active Areas

- waste lift thickness
- active filling area slope angle
- final waste slope angle
- identification of areas with visible ponding, seepage, or indications of mass snow burial

Inactive Areas with Intermediate Cover (SICM or earthen material)

- overall surface and/or intermediate cover condition
- evidence of surface cracking
- localized surficial depressions in waste or cover surface
- erosion of cover material
- erosion of ditch linings
- leachate breakout on sideslopes
- areas of ponded water
- toe heaving
- grass kills
- gas venting

Geotechnical performance observations indicated that the landfill slopes were stable and that differential waste settlement was minor and can be managed to tolerable levels during final cover design. The active waste placement in Cell 7/9/10/11 and Cell 12 is performing as anticipated. At the time of the inspection, there were no indications of inconsistencies between site activities and JRL Expansion Operations Manual (NEWSME 2021).

During previous site inspection, ponded stormwater (in what appears to be an intercepting drainage ditch) was observed on the SICM in the northwest inactive portion of the landfill at an elevation of approximately 317 msl. To mitigate this condition, the local topography was subsequently modified to re-establish passive drainage of stormwater runoff in this area (see Appendix F Photos ##16-17).

4.3 Fluid Pressure Measurements

In accordance with the Board Order for the landfill expansion, a fluid pressure transducer was installed in the leachate collection layer of Cells 11 & 12 (at the location shown on Figure 1) to confirm system design by measuring fluid levels in this drainage layer. These instruments were placed at the bottom of the 12-inch sand layer of the leachate collection system that overlies the geocomposite layer of the containment liner.

To help determine the degree that the hydraulic head within the leachate collection layer is minimized, daily instrument readings were recorded during 2021 as presented in Appendix E. The small values demonstrate that the levels are minimal, verifying that the leachate collection at these locations in Cell 11 & 12 are performing in accordance with design.

4.4 Surveys

A topographic survey of the landfill surface was completed on June 24, 2021 using aerial photogrammetric methods. A spot check of surface elevations indicates that the waste slope angles are consistent with the project design and JRL Expansion Operations Manual (NEWSME 2021). Elevation contours for covered areas were visually examined for depressions, heaving, and ditch slope continuity. Consistent with site observations, these observations indicate that the landfill is performing as anticipated during design with no noticeable excessive differential settlements or instabilities. Exclusive of the excavation area in Cells 1 & 2, comparisons with the aerial survey made in June 2021 show no discernable differences in the overall topography of the landfill surface that would indicate large differential settlements or slope instabilities.

4.5 Modifications to the Geotechnical Monitoring Plan

As addressed the last two years, the current GMP (included as part of the JRL Expansion Operations Manual, NEWSME 2021), includes weekly routine inspections and an evaluation of fluid levels in the leachate collection layer of JRL expansion cells (i.e. Cells 11 to 17). No other modifications to the GMP are proposed for 2022.

5. SUMMARY

Geotechnical monitoring of JRL was performed to verify that the operations and field behavior of the facility is consistent with design analyses and geotechnical plans. Consistent with the modifications in 2008 and 2010, field observations of landfill activities were emphasized in assuring consistency with the JRL Expansion Operations Manual (NEWSME 2021) and, in the process, confirmed that there were no indications of potential slope instabilities or excessive differential settlements that might impact the performance of the facility.

In accordance with the current GMP (which is included as part of the JRL Expansion Operations Manual, NEWSME 2021), routine weekly visual site inspections of the landfill were made during normal operations in 2021. In addition, an aerial topographic survey of the facility was conducted on June 24, 2021, and an annual geotechnical inspection was performed on August 30, 2021. This monitoring documented that the landfill is performing as anticipated with no excessive deformations, slope movements, unexplained ponded water, or leachate breakouts. Site observations made of the inactive areas and the operational activity in Cells 12 and the top of Cells 7/9/10/11 indicate that the landfill is performing as anticipated during design. Measurements of the fluid levels in the leachate collection system at the base of Cells 11 & 12 (as measured by the in-place transducers) indicate that the head on the liner system is minimal and is performing in accordance with design.

APPENDIX A

Summary of Wastes Accepted at Juniper Ridge Landfill Report 2021

Summary of Wastes Accepted at Juniper Ridge Landfill Report Year 2021				
Waste Type #	**Waste Types**	**Total (tons)**	**Origin**	**% Total Waste**
1	Bypass MSW[5]	221,926	Maine	25.2
2	CDD/MSW Processing Residue - OBW (Disposed of in the Original 2004 Permitted Footprint)	8,874	Maine	1.0
3	CDD/MSW Processing Residue - OBW (Disposed of in the Expansion Permitted Footprint)[4]	73,561	Maine	8.3
4	CDD Processing Residue - Fines[1]	95,519	Maine	10.8
5	Mixed CDD	319,038	Maine	36.2
6	Wood from CDD[2]	44	Maine	0.0
7	Residue/Trash from Single Stream	6,683	Maine	0.8
	Special Wastes Types			
8	Burn Pile Ash and/or Hot Loads Area Ash	514	Maine	0.1
9	Catch Basin Grit & Street Sweeping	538	Maine	0.1
10	Coal, Oil & Multi-fuel Boiler Ash	3,250	Maine	0.4
11	Contaminated Soil & Debris	9,300	Maine	1.1
12	Dredged Spoils	1,593	Maine	0.2
13	Industrial (Miscellaneous)	40	Maine	0.0

SUBTOTAL WASTE TYPES 1-7		725,644	Maine	82.3
SUBTOTAL WASTE TYPES 8-29		156,480	Maine	17.7
GRAND TOTAL WASTE RECEIVED[3]		**882,124**	Maine	

1. Used as alternative daily cover (ADC).

2. Wood from CDD was received at the Juniper Ridge Landfill wood storage facility (ADC).

3. Total does not include purchased materials: tire chips (548.01 tons). Monthly reports included this purchased material. Total derived from sum of higher significant digit numbers, not rounded whole numbers as provided in the above table.

4. On 11/29/21, MEDEP approved an increase of OBW in the Expansion area. The previous limit of 65,000 tons per year, set by expansion license #S-020700-WD-BI-N, was modified through solid waste minor revision #S-020700-WD-CM-M. The minor revision approved additional disposal of OBW to 76,648 tons for calendar year 2021.

5. CRM/MRC 17,547.41 tons, ecomaine 23,924.29 tons, PERC 180,453.80 tons.

APPENDIX B

JRL Estimate of Landfill Capacity December 31, 2021

Juniper Ridge Landfill
Estimate of Remaining Capacity as of December 31, 2021

	Values	Units	Source	
Landfill Capacity Remaining in Cells 1-10 as of December 31, 2020	895,289	cy	Calculated 2020 capacity evaluation	MSE Berm used for final waste surface for Cells 1-10 as permitted
Landfill Capacity Remaining in Cells 11-17 as of December 31, 2020	6,563,510	cy	Calculated 2020 capacity evaluation	
Remaining Site Capacity as of June 25, 2021 in landfill Cells 1-10	761,500	cy	June 24, 2021 Site Survey	MSEBerm used for final waste surface for Cells 1-10
Remaining Site Capacity as of June 25, 2021 in Expansion Cells 11 thru 17	6,101,900	cy	June 24, 2021 Site Survey	
Tons Placed in Landfill Cells 1-10 (tons) between June 25, 2021 and December 31, 2021.	9,587.09	tons	JRL Records	Wendy Plissey 03-09-2022 (Wood Pile tonnage left out (21.97 tons)
Tons Placed in Expansion Landfill Cells 11-17 (tons) between June 25, 2021 and December 31, 2021.	468,218.91	tons	JRL Records	Wendy Plissey 03-09-2022
Compaction Factor Three Year Running Average through June 2021	0.93	ton/cy	JRL Records	For Cells 1-12 (Cell 13 was not constructed until 9-31-2021). Note the previous (2020) compaction rate used for this calculation was 0.93tons/cy.
Calculated Capacity Used in Cells 1-10 between June 25, 2021 and December 31, 2021 (CY)	10,309	cy	Calculation	
Calculated Capacity Used in Cells 1-10 in 2021	144,098	cy	Calculation; Compaction factor change from 0.81 to 0.93.	
Compaction used in Cells 11-17 between June 25, 2021 and December 31,2021	0.70	ton/cy	JRL	
Calculated Capacity Used in Cells 11-17 between June 25, 2021 and December 31, 2021 (CY)	668,884	cy	Calculation	Based on 0.70 compaction factor. Based on Airspace Capacity Report 06-24-2021 analysis update (03Aug2021)
Calculated Capacity Used in Cells 11-17 in 2021	1,130,494	cy	Calculation	
Estimated Remaining Cell 1 thru Cell 10 Capacity as of December 31, 2021	**751,191**	**cy**	Calculation	Includes MSE Berm Capacity
Estimated Remaining Cell 1 thru Cell 13 Capacity as of December 31, 2021	**1,193,007**	**cy**	Calculation	Cell 1 thru 13 Capacity Remaining reported as of 6-24-2021 of 1,872,200 cys minus capacity consumed to end of 2021.
Estimated Remaining Site Capacity in Cells 11-17 as of December 31, 2021	**5,433,016**	**cy**	Calculation	

Tons Disposed of in Landfill Cells 1 thru 10	**12,595**	**Tons**	Provided by JRL	Calculated based on a few overlapping tonnage reports.
Tons Disposed of in Landfill Cell 11 &12	**869,529**	**Tons**	Provided by JRL	
Total Reported Tons Disposed of in Entire Landfill Cells 1 thru 12	**882,124**	**Tons**	Provided by JRL

Appendix C

Weekly/Monthly Landfill Inspection Form

WEEKLY/MONTHLY INSPECTION FORM

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	09-02-21
Inspector Name/Signature	Jeffrey Pelletier / [signature]

Note: For weekly inspections, only Table 1 and Table 3 need to be completed. For monthly inspections, Tables 1, 2 and 3 need to be completed.

Table 1
Inspection of Active Areas at the Facility

Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Borrow Pit	Is there evidence of tracking or erosion from site soil borrow areas with potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Mobile Equipment	Is mobile equipment leaking oil or other liquids with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)

Active Areas at the Facility	
Comments	Looks good

Table 2
Inspection of Stabilized Areas at the Facility

Stabilized Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Comments	Looks good		

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Detention Pond 1	Good
Geomembrane Lined Storage Pond	Good
Detention Pond 2	Good
Detention Pond 6	Good
Litter Fence	Good
Lechate Storage Tank Containment Area	Good
Leachate Storage Tank Containment Area Riprap Outlet	Good
Leachate Loading Rack Catch Basin	Good
Detention Pond 9	Good
2,000-Gallon Underground Storage Tank	Good
Detention Pond 5	Good
Outfall No. 1	Good
Outfall No. 2	Good
Outfall No. 3	Good

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Outfall No. 4	Good
Outfall No. 5	good
Outfall No. 6	good
Outfall No. 7	good ECM Could be refreshed. Completed by Sargent Corp. [illegible]

Table 4
New Potential Pollutant Source and/or Recommendations for Additional BMPs

Reference	Description	Schedule

Certification

☒ Site is in compliance with SWPPP and MSGP.
☐ Site is not in compliance with SWPPP and MSGP and either structural control measure maintenance, additional controls, or modifications to the SWPPP are required.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Name: Jeffrey Pelletier	Telephone: 207-249-8025

Appendix D

Checklist: Annual Geotechnical Landfill Inspection

Table D-1
Checklist: Annual Geotechnical Inspection
2021 Annual Geotechnical Landfill Monitoring Report, Juniper Ridge Landfill, Old Town, Maine

Observation Date: 8/30/2021
Monitor Name: Richard E. Wardwell
Weather: cloudy, temperatures in mid-60's

Observation Area	Sat.	Unsat	Description (location, direction, appearance, etc.)	Proposed Action
Active Area				
location description	-	-	top of Cells 9/10/11 (#18, 21, 22), base of Cell 12 (see Photos #18-22)	n/a
slope stability	X			
waste lift thickness	X			
active slope angle	X		~2½:1 to 3:1 (see Photos #16,17)	
erosion	X			
leachate breakout	X		none observed (N/O)	
ponded water	X		N/O	
toe heaving	X		N/O	
overall condition	X		stable slope appearance	
Inactive Area (Synthetic)			Synthetic Interim Cover Material (SICM) over most slopes	
location description	-	-	except lower west slope	n/a
slope stability	X		isolated surface bulge associated with SICM anchor	none needed
cracking	X		N/O	
erosion	X		N/O	
leachate breakout	X		N/O	
ponded water	X		northwest corner of landfill regarded to minimize ponding (see Photos #16,17)	regrade to establish drainage
toe heaving	X		N/O	
overall condition	X		stable SICM slope appearance (see Photos 1-7, 9-1,15,16)	
Interim Soil Cover				
location description	-	-	lower westerly slopes	n/a
overall surface conditio	X		good grass/soil cover except in excavation (see Photo #7,10,13-15,21)	
cracking	X		N/O	
erosion of cover materia	X		N/O	
erosion of ditch linings	X		N/O	
leachate breakout	X		N/O	
ponded water	X		N/O	
toe heaving	X		N/O	
grass kills	X		N/O	
gas venting	X		N/O	
overall condition	X		good stable condition (see Photos 19,21,23)

Hampden, ME 04444

Subject: Update of Opinion of Capital Closure and Post-Closure Costs
Calendar Year 2022
Juniper Ridge Landfill
Old Town, Maine

Dear Jeffrey:

As requested by NEWSME Landfill Operations LLC (NEWSME), Sevee & Maher Engineers, Inc. (SME) has updated our opinion of capital closure and post-closure costs for the Juniper Ridge Landfill (JRL) in Old Town, Maine for calendar year 2022. The capital closure cost is for those cells that, as of the end of the calendar year 2022, have been or will be constructed and operational, but have not received final cover. These include Cells 1, 2, 3A, 3B, 4, 5, 6, 7, 11, 12, 13, 14 and portions of Cells 8, 9, and 10. In total, these landfill cells have approximately 96.6 acres of area requiring future closure. This does not include the proposed 5.2 acres of Stage 1 Final Cover to be constructed in the southeast corner of the landfill in 2022. Our opinion of the capital closure cost to close the remaining 96.6 acres is $26,306,000. This cost is based on a per-acre closure cost presented in Table 1, for a final cover consistent with the final waste grades and cover components requirements of Maine Department of Environmental Protection (MEDEP) Solid Waste Management Rules (SWMRs).

The post-closure monitoring and maintenance cost for the site (as of April 2022) is $12,309,900 for the items presented in Table 2. The post-closure costs assume a 30-year post-closure period and are based on 2022 dollars.

Our opinion of closure and post-closure costs is based on the following assumptions.

1. The closure of the individual cells will consist of placing final cover over the areas of the developed landfill which have not received final cover. Note the cost to remove and replace the intermediate cover is not included in the final cover costs presented herein. The cost to install an active gas collection system as part of closure is only included for landfill areas which currently do not have any active gas systems. It is assumed that the current systems will continue to operate during the post-closure period. In areas that currently do not have active gas collection, it is assumed that a gas extraction system will be installed as part of the final cover construction.

2. The final cover of these cells will consist of the components proposed in the Stage 1 Final Cover design report which are consistent with the current SWMRs. SME's opinion of closure costs is based on our current understanding of site conditions and unit costs from NEWSME's Stage 1 Final Cover project which reflect cover construction on 3H to 1V side slopes.
3. Bids were received for Stage 1 Final Cover construction in April 2022 and the per acre closure cost table was updated to reflect bid prices. The unit costs for most items increased from 2021 to 2022. The Stage 1 Final Cover design included three layers (6-inch sand bedding, geosynthetic clay liner, and 250-mil drainage geocomposite) that were added during the cover system evaluation and not previously included in the 2021 post-closure per acre cost estimate.
4. The post-closure costs include landfill inspection, water quality monitoring, leachate management, general site maintenance, gas treatment and maintenance, and engineering for the entire facility. These post-closure costs are based on our current understanding of site conditions, and projections of both leachate and landfill gas quantity and quality, and costs associated with treatment and disposal. Actual post-closure costs will vary and are dependent upon the actual nature of site conditions at the time of closure, long-term management decisions of NEWSME and the Regulators, and other factors not evident at this time.

If there are any questions concerning our opinion of costs presented in this letter, please feel free to contact us.

Sincerely,

SEVEE & MAHER ENGINEERS, INC.

Rhonda M Forrester

TABLE 1

OPINION OF FINAL COVER COSTS FOR JUNIPER RIDGE LANDFILL
DEVELOPED LANDFILL AREA
AS OF DECEMBER 2022

JUNIPER RIDGE LANDFILL PER-ACRE FINAL COVER COSTS (GAS COLLECTION NEEDED) (Update 4/2022)				
ITEM	UNIT	QUANTITY	UNIT COST[(1)]	TOTAL
Mobilization	L.S.	1	$26,300	$26,300
Erosion Control	L.S.	1	$6,400	$6,400
Active Gas System	L.S.	1	$24,300	$24,300
Site Grading of 6" Bedding Sand	C.Y.	810	$29	$23,490
12" Compacted Till	C.Y.	1,620	$18	$29,160
Geosynthetic Clay Liner	SQ.FT.	43,560	$0.65	$28,320
40-mil Textured Geomembrane	SQ.FT.	43,560	$0.58	$25,260
250-mil Drainage Geocomposite	SQ.FT.	43,560	$0.63	$27,440
12" Drainage Sand	C.Y.	1,620	$29	$46,980
12" Vegetative Cover	C.Y.	1,620	$18	$29,160
Seed & Mulch	L.S.	1	$2,600	$2,600
Engineer/Const. Monitoring	L.S.	1	$25,300	$25,300
			Total	$294,710

JUNIPER RIDGE LANDFILL PER-ACRE FINAL COVER COSTS (EXISTING GAS COLLECTION) (Update 4/2022)				
ITEM	UNIT	QUANTITY	UNIT COST[(1)]	TOTAL
Mobilization	L.S.	1	$26,300	$26,300
Erosion Control	L.S.	1	$6,400	$6,400
Site Grading of 6" Bedding Sand	C.Y.	810	$29	$23,490
12" Compacted Till	C.Y.	1,620	$18	$29,160
Geosynthetic Clay Liner	SQ.FT.	43,560	$0.65	$28,320
40-mil Textured Geomembrane	SQ.FT.	43,560	$0.58	$25,260
250-mil Drainage Geocomposite	SQ.FT.	43,560	$0.63	$27,440
12" Drainage Sand	C.Y.	1,620	$29	$46,980
12" Vegetative Cover	C.Y.	1,620	$18	$29,160
Seed & Mulch	L.S.	1	$2,600	$2,600
Engineer/Const. Monitoring	L.S.	1	$25,300	$25,300
			Total	$270,410

Notes:
1. Unit costs based upon Third Party Construction Cost (Stage 1 Final Cover bid dated April 2022).

	Acres	Closure Cost
Area with Existing Gas Collection that have not received Final Cover (Cells 1 - 13)	89	$24,066,000
Area without Gas Collection (Cell 14)	7.6	$2,240,000
Total	96.6	$26,306,000

TABLE 2

OPINION OF POST-CLOSURE MONITORING AND MAINTENANCE COSTS FOR JUNIPER RIDGE LANDFILL
DEVELOPED LANDFILL AREA AS OF DECEMBER 2022

ITEM	OPINION OF AVERAGE YEARLY COSTS	TOTAL COST FOR 30 YEAR PERIOD	ASSUMPTIONS
Leachate Collection, Transport and Disposal			
A. Electrical Costs to Operate Pump Stations	$ 1,200	$36,000	Assumes a 15 hp (75 percent efficiency) pump pumping for 622 hours per year with electrical costs of $0.18 /kWhr.
B. Disposal Costs for Leachate Years 1-30	$ 81,500	$2,445,000	Leachate generation is estimated for a 30 year period beginning with 17.1 M gallons at year 1 and decreasing to 0.26 M gallons at year 30. Transportation cost of $0.02184/gal.
C. Annual Leachate Testing	$ 5,200	$156,000	Annual cost for pretreatment testing.
	Subtotal Total	**$2,637,000**	
Post Closure Water Quality Monitoring			
A.1 Collect Samples From 24 Wells, 11 Underdrains,2 Leachate, 1 Leak Detection, 7 Surface Waters & 3 Pore Waters for 3 Rounds/Year & Methane Measurements From Wells 3 Times per Year	$ 42,900	$214,500	Assumes two rounds field parameters and one round detection monitoring parameters for years 1-5.
A.2 Collect Samples From 24 Wells, 11 Underdrains,2 Leachate, 1 Leak Detection, 7 Surface Waters & 3 Pore Waters for 2 Rounds/Year & Methane Measurements From Wells 2 Times per Year	$ 28,600	$143,000	Assumes one round field parameters and one round detection monitoring parameters for years 6-10.
A.3 Collect Samples From 24 Wells, 11 Underdrains,2 Leachate, 1 leak Detection, 7 Surface Waters & 3 Pore Waters for 1 Round/Year & Methane Measurements From Wells 1 Time per Year	$ 14,300	$286,000	Assumes one round detection monitoring parameters for years 11-30.
B.1 Analyses of 52 Samples 3 Times per Year	$ 53,400	$267,000	Assumes 24 wells,11 underdrains,2 leachate, 1 Leak Detection 7 surface,3 pore water & 4 QA/QC.
B.2 Analyses of 52 Samples 2 Times per Year	$ 35,600	$178,000	Assumes 24 wells,11 underdrains,2 leachate, 1 leak detection, 7 surface,3 pore water & 4 QA/QC.
B.3 Analyses of 52 Samples 1 Time per Year	$ 17,800	$356,000	Assumes 24 wells,11 underdrains,2 leachate, 1 leak detection, 7 surface,3 pore water & 4 QA/QC.
C. Compile Data and Submit to MDEP	$ 4,600	$138,000	Assumes Report prepared and submitted to MEDEP after each sampling round.
Subtotal Yearly Cost Years 1-5	$ 100,900		
Subtotal Yearly Cost Years 6-10	$ 68,800		
Subtotal Yearly Cost Years 11-30	$ 36,700		
	Subtotal Total	**$1,582,500**	
Landfill Inspection			
A. Monthly Site Walk Over & Report Generation	$ 9,180	$275,400	Assumes 9 hr. per month @ $85/hr.
Subtotal	**$ 9,180**	**$275,400**	
Active Landfill Gas Extraction System			
A. Gas Collection Equipment Replacement	$ 11,200	$336,000	General equipment replacement including well heads, condensate pumps etc.
B. Flare Maintenance	$ 6,100	$183,000	Replacement of flare parts such as flame arrestor media etc.
C. Blower Maintenance	$ 6,100	$183,000	Routine inspection and maintenance of blower & control system.
D. System Operation and Inspection	$ 5,800	$174,000	General system operation & maintenance.
E. Well Tuning	$ 11,200	$336,000	Well tuning once per month.
F. Compliance Monitoring and Reporting	$ 18,400	$552,000	Includes Compliance Air Monitoring and Reporting.
G. Electrical Costs to Operate Blowers, Heat & Control Panel Years 1-30	$ 62,000	$1,860,000	Electricity for blowers assumes varying horsepower requirement as gas decreases @$0.18/kWhr.
H. Landfill Gas Treatment Costs Years 1-30	$ 80,500	$2,415,000	Includes treatment cost for H2S removal to 1,000 ppm using Thiopaq system at a cost of $2,050 per ton.
	Subtotal Total	**$6,039,000**	
Landfill Maintenance			
A. Cover Maintenance Including Annual Mowing & Erosion Repair	$ 9,000	$270,000	Assumes 2 man crew 10 days/ year.
B.1 Pump Stations Inspections	$ 11,700	$351,000	Assumes 4.5 hr./ week @ $50 per hour.
B.2 Pump Replacement Every Five Years (Not Annual Cost)	$ 42,000	$252,000	Assumes replacing 14 on-site pumps every 5 years at $3,000 a piece.
C. General Site Maintenance	$ 8,000	$240,000	Assumes snow plowing 20 storms per year @ $430 per storm.
D. Leachate Line Cleaning	$ 27,000	$540,000	Assumes leachate line cleaning once per year for years 1-10, then every other year, for years 11-30 @ $27,000 per cleaning.
Subtotal	**$ 97,700**	**$1,653,000**	
Professional Services			
A. Engineering Services	$ 4,100	$123,000	General Services
Subtotal	**$ 4,100**	**$123,000**	
TOTAL		**$12,309,900**	

ATTACHMENT K

MSW Diversion

JRL 2021 Annual Report

Compliance with Condition 5 of #S-020700-WD-BC-A

(Casella MSW Landfilling Diversion)

Best efforts by Casella to divert MSW from landfilling at JRL to the greatest extent practicable:

5.A: A list and description of all diversion options evaluated and/or pursued by Casella, including currently operating Maine waste-to-energy facilities as options:

Diversion of MSW through Recycling

1. Casella's Zero-Sort program delivering MSW recyclables collected in Maine to the Casella processing facility in Lewiston.
2. Casella's cardboard recycling program wherein source separated cardboard is collected, baled, and marketed to end use recyclers.
3. Operation of the Casella Zero-Sort processing facility in Lewiston, Maine. Outreach to municipalities and businesses to encourage participation in Casella's Zero-Sort recycling program.

Diversion of MSW to Maine Incinerators and Processing Facilities

ecomaine:

Casella's Pine Tree Waste hauling companies collect and deliver Maine MSW and recycling materials to the ecomaine incinerator and single stream recycling facility.

MMWAC:

Casella's Pine Tree Waste hauling companies collect and deliver Maine MSW to the MMWAC incinerator.

PERC:

In 2019 an agreement was reached with PERC to annually deliver up to 107,000 tons of Maine MSW. This agreement included an additional 27,000 tons of Maine MSW delivered to PERC. This is more than half of the expected annual throughput at the PERC facility. In addition, in the 2019 agreement with PERC a new provision has been added that if Coastal Resource Management (CRM) cannot accept the commercial tons provided for in the CRM agreement that MSW from the Bangor and Waterville markets will be taken to PERC.

COASTAL RESOURCE MANAGEMENT:

In 2017 an agreement was reached with CRM to deliver 40,000 tons annually of Maine municipal solid waste to CRM's recycling and processing facility in Hampden, in addition to deliveries of collected material from Municipal Review Committee (MRC) communities by Pine Tree Waste.

SWAP AGREEMENT:

A collective agreement was reached between Pine Tree Waste, Inc., NEWSME Landfill Operations, LLC, Waste Management Disposal Services of Maine, Inc., Municipal Review Committee, Inc., and Coastal Resources of Maine, LLC, pursuant to which bypass MSW and oversized bulky waste collected from some MRC communities, primarily within the greater Bangor area, would be delivered to JRL rather than being delivered to the Crossroads Landfill, and an equivalent amount of MSW originating in Maine that otherwise would be delivered by Pine Tree to JRL would instead by delivered by Pine Tree to the Crossroads Landfill.

Diversion by Disposal at Other Landfills

Casella's Pine Tree Waste hauling companies (Bethel, Columbia, Fairfield, Hermon, Houlton, Mechanic Falls, Old Orchard Beach, Sanford, Scarborough, Waterville, and West Bath) collect Maine MSW and deliver to landfills other than Juniper Ridge: Bath, Brunswick, Fort Fairfield / Presque Isle (RWS), and Norridgewock, Maine, Lawrence Station, New Brunswick, and Berlin, New Hampshire.

5.B: A narrative detailing the specific efforts made by Casella to implement diversion options:

See narrative description in 5.A above.

5.C: A narrative describing the results of Casella's evaluation/pursuit of MSW diversion options, including the volume of waste and diversion destination of MSW successfully diverted and/or the specific reasons that MSW was not diverted to other destination options.

Maine MSW Recyclables Delivered to Casella Zero-Sort in Lewiston, ME

- Number of Maine municipalities participating in Casella's Zero-Sort program in calendar year 2021: 43
- Number of Maine businesses participating in Casella's Zero-Sort program in calendar year 2021: approx. 3,539
- Tons of Maine MSW recyclables processed in Casella's Zero-Sort program in calendar year 2021: 31,484 tons

Casella cardboard recycling

Fiber brokered and baled directly from Maine municipalities or Maine businesses in calendar year 2021:

- Brokered: 22,055 tons
- Baled: 17,118 tons

Maine MSW Delivered to Maine Incinerators and Processing Facilities in 2021

ecomaine:

- Single-stream recyclables: 13,708 tons
- MSW: 60,872 tons

MMWAC:

- MSW: 38,854 tons

PERC:

- MSW: 189,709 tons

CRM:

- MSW: 0 tons

Maine MSW Delivered to Landfills Other than Juniper Ridge in 2021

Bath Landfill:

- MSW: 1,402 tons

Brunswick Landfill:

- MSW: 365 tons

Fort Fairfield / Presque Isle Landfill (RWS):

- MSW: 12,789 tons

Norridgewock Landfill:

- MSW: 22,852 tons

Southwest New Brunswick Service Commission (Lawrence Station, NB):

- MSW: 4,183 tons

Total Maine MSW diverted from disposal at JRL in 2021 through efforts described above

- 415,391 tons

Total Maine, non-bypass MSW disposed at JRL in 2021

- 0 tons
