Re: Juniper Ridge Landfill 2023 Annual Report

Dear Ms. Knuuti:

Enclosed for your review is the Juniper Ridge Landfill 2023 Annual Report and supporting documentation as required.

Should you require additional information or clarification, please do not hesitate to contact me at 207-249-8025 or Wayne Boyd at 207-862-4200 ext. 224.

Respectfully submitted,

NEWSME Landfill Operations, LLC.

Jeffrey Pelletier
Environmental Manager

1.0 INTRODUCTION

Pursuant to the requirements of 38 MRS §1310-N(6-D), this document, and associated attachments, serve as the 2023 Annual Report for the Juniper Ridge Landfill (JRL) located off Route 16 in Old Town, Maine. The information contained in this report also addresses the requirements of:

- Section 401.4.D of Maine Solid Waste Management Rules;
- Condition 19 of Solid Waste Order #S-020700-WD-N-A;
- Condition 4 of Solid Waste Order #S-020700-WD-W-M;
- Conditions 12, 14, 15, and 20 of Solid Waste Order #S-020700-WD-BI-N; and
- Condition 2 of Solid Waste Orders #S-20700-WD-CM-M.

As the contracted operator of the Juniper Ridge Landfill, NEWSME Landfill Operations, LLC (NEWSME), an indirect subsidiary of Casella Waste Systems, Inc. (CWS) is submitting this annual report to the Maine Department of Environmental Protection (MEDEP) on behalf of the Maine Bureau of General Services (BGS). Pursuant to P.L. 2011, Chapter 655, Sec. GG-69, on July 1, 2012 the Bureau of General Services in the Department of Administrative and Financial Services became the owner and licensee of JRL. Prior to July 1, the State Planning Office (SPO) owned JRL and held its licenses. The SPO was abolished on July 1, 2012.

1.1 Overview

JRL property consists of a 780-acre site accessed off Route 16 in Alton, with a physical address of 2828 Bennoch Road, Old Town, Maine. The licensed solid waste footprint of the JRL is approximately 122 acres. A location map of the JRL site and the surrounding facilities is shown on Figure 1-1. The JRL was originally licensed (#S-020700-7A-A-N) by the Board of Environmental Protection on July 28, 1993 as a generator-owned landfill for disposal of pulp and papermaking residuals generated by the Fort James Paper Mill located in Old Town, Maine. The original approved capacity of the facility was approximately 3 million cubic yards. Landfill operations began in Cell 1 in December 1996.

In June 2003, the Maine legislature passed Resolve 2003, Chapter 93, which authorized the State of Maine to pursue the purchase of the JRL from Fort James Operating Company. The final purchase agreement between SPO and Fort James would provide disposal capacity for the mill's waste for a 30-year period. On October 30, 2003, the SPO submitted an amendment application to the MEDEP to increase the approved final elevation of the landfill, and to dispose of additional waste streams at the facility.

On February 5, 2004, SPO formally purchased the JRL property from Fort James and signed an Operating Services Agreement with NEWSME to operate the facility for a 30-year period. At the same time, previously approved MEDEP operating licenses for the JRL were transferred to the SPO. On April 9, 2004, the MEDEP approved the amendment application and issued permit #S-020700-WD-N-A to the SPO to increase the original JRL capacity from approximately 3.3 million cubic yards to approximately 10.2 million cubic yards. An expansion of an additional 9.35 million cubic yards of capacity was approved for the site by the Maine Board of Environmental Protection (MEBEP) on June 1, 2017 with Board Order #S-020700-WD-BI-N and #L-19015-TG-D-N.

Since the execution of the Operating Services Agreement, NEWSME has been operating the site and is responsible for costs associated with development, operation and closure/post-closure activities at the JRL.

To date, Cells 1, 2, 3A, 3B, 4, 5, 6, 7, 8, 9, and 10 of the 2004 amendment license have been constructed; this accounts for the 68-acre landfill approved by the MEDEP Solid Waste Order #S-020700-WD-N-A. The last phase of filling the originally permitted landfill includes filling over the eastern and northern outer waste side slopes of the originally permitted landfill cells to achieve final waste grades of the 2004 permitted footprint. It is NEWSME's intent to fill this capacity in conjunction with the filling of expansion cells.

- To date, Cells 11, 12, 13, 14, and 15 have been constructed as part of the 54-acre JRL expansion, approved by MEBEP Board Order #S-020700-WD-BI-N and #L-19015-TG-D-N. Cell 11 was constructed in 2018, followed by Cell 12 in 2020, Cell 13 in 2021, Cell 14 in 2022, and Cell 15 in 2023. Approval to commence waste placement in Cell 15 was issued by the MEDEP on August 18, 2023. In 2023 waste placement occurred primarily in Cells 13, 14, 15, and the area where Stage 1 Final Cover was constructed (primarily the southern side slope of Cell 10). Lesser amounts of waste were also placed on the north slope of the 2004 permitted footprint (Cells 1, 2, 3A, and 3B). Intermediate cover was placed once final waste grades were reached.

As of December 31, 2023, 5,356,397 cubic yards of total permitted capacity remained at the JRL. Further Discussion is described below in Section 3.2.

1.2 Annual Report Format

This Annual Report contains the information required by Section 401.4.D of the Maine Solid Waste Management Rules (Rules), including a general summary of activities during 2023, a compliance evaluation performed by JRL's environmental manager, a summary of 2023 operations and operational information, a summary of facility site changes, a summary of the site monitoring performed at and around the site during 2023, an update of the costs and documentation of changes to the closure and post-closure funding of the facility, and a summary of best efforts by CWS to divert MSW from landfilling at the JRL to the greatest extent practicable.

2.0 SUMMARY OF SITE ACTIVITIES

2.1 Site Activities

The following landfill related site activities occurred at JRL during 2023:

- Began construction of the Renewable Natural Gas (RNG) Facility;
- Removal of the geosynthetic intermediate cover material on the southern side slope of Cell 10, to allow for additional waste placement, in preparation for Stage 1 Final Cover;
- Construction of Cell 15 (6.7 Acres) and associated infrastructure;
- Installation of additional above ground power infrastructure on the northwest side of the landfill expansion area;
- Placement of soft layer material in Cell 15, along with routine waste placement primarily in Cells 13, 14, 15 and where Stage 1 Final Cover was constructed (primarily the southern side slope of Cell 10). Lesser amounts of waste were also placed on the north slope of the 2004 permitted footprint (Cells 1, 2, 3A, and 3B);
- Construction of Stage 1 Final Cover (8.6 acres);
- Excavation and stockpiling of soils in the borrow area;
- Continued placement of intermediate cover on the 2004 permitted footprint and the side slopes of Cells 14 as waste grades were reached; and
- Continued installation of new landfill gas collection components in the original 2004 permitted footprint and Cells 14, and 15 of the expansion. Components installed included new vertical LFG extraction wells, gas collection trenches, 12" header piping, and lateral extraction piping.

2.2 Summary of Applications Submitted and/or Approved at JRL in 2023

Listed in Table 2-1 is a summary of MEDEP, Local, and Federal applications that were submitted and or approved at JRL during 2023.

Table 2-1 Summary of Applications Submitted and/or Approved at JRL, 2023

Application Description	Agency	Permit/License Number
Approval of the Cell 15 Construction Design Report and received a condition compliance license	MEDEP	S-020700-WD-CR-C
Approval of the 2023 Annual Oversized Bulky Waste Limit Request	MEDEP	Approved (no permit issued)
Approval of the Cell 15 compacted clay placement test pad program/Stormwater Diversion Plan	MEDEP	Approved (no permit issued)
Approval of Stage 1 Final Closure Condition Compliance	MEDEP	S-020700-WD-CQ-C
Approval for JRL Stage 1 Final Cover Change Order 1, 2, 3 (Cover Drainage Pipe Spacing/Seam Strength/Additional Anchor)	MEDEP	Approved (no permit issued)
Updates regarding ATMOS Technologies Soil Equivalent Foam Trial	MEDEP	Approved (no permit issued)
Approval of the Stage 1 Final Cover compacted clay placement test pad program	MEDEP	Approved (no permit issued)
Review/approval of JRL Financial Assurance Bonds	MEDEP	Approved (no permit issued)
Cell 15 final inspection completed. Approval to start soft layer material placement	MEDEP	Approved (no permit issued)
Federal Fish & Wildlife Permit Renewal (Bird Depredation)	US Dept of Fish and Wildlife	MB670894-0 Pending Approval
Approval of substantial compliance with Stage 1 Final Cover Schedule of Compliance	MEDEP	Approved (no permit issued)
Determination of Environmental Feasibility of the proposed expansion based on the submitted Preliminary Information Report. (This determination does not constitute approval of the expansion, only warrants further investigation to determine its suitability)	MEDEP	Approved (no permit issued)

Table 2-1 Cont. Summary of Applications Submitted and/or Approved at JRL, 2023

Application Description	Agency	Permit/License Number
Approval of Air Emissions License Amendment to allow for the installation of a continuous polit light of JRL's Flare #4	MEDEP	A-921-77-6-A
Approval to add additional material on the top of Cells 1-10 until Cell 15 is completed. Material must be later removed	MEDEP	Approved (no permit issued)
Submittal of Stage 2 Final Cover Design Report for compliance with Final Cover Schedule of Compliance	MEDEP	Pending Approval

2.3 Compliance Self-Audit

As required by Section 401.4.D (1) (b) of the Rules, JRL performed an annual evaluation of landfill operations for calendar year 2023. A copy of the Audit is included as Attachment A of this report.

3.0 SUMMARY OF OPERATIONS

3.1 Types of Wastes Received at JRL during 2023

During calendar year (CY) 2023, JRL received and disposed a total of 834,363 tons of waste material. Table 3-1 summarizes the waste types received, along with their corresponding tonnages.

In compliance with JRL's permit condition, wastes going to the landfill were screened in advance to prevent out-of-state wastes from being accepted at the facility.

3.2 Estimates of Capacity Utilized during 2023 and Remaining Capacity

During 2023 approximately 975,775 cubic yards of capacity was utilized in Cells 1-15. These estimates are based on June 23, 2023 aerial survey results. Since survey data for the entire site is utilized, these values account for capacity gains due to settlement, compaction, and waste decomposition. Remaining capacity at JRL, as of December 31, 2023 is list below in Table 3-2.

Table 3-1 Summary of Wastes Accepted at JRL, 2023

Summary of Wastes Accepted at Juniper Ridge Landfill Report Year 2023				
Waste Type #	**Waste Types**	**Total (tons)**	**Origin**	**% Total Waste**
1	Bypass MSW[5]	266,452	Maine	31.9
2	CDD/MSW Processing Residue - OBW (Disposed of in the Original 2004 Permitted Footprint)	10,679	Maine	1.3
3	CDD/MSW Processing Residue - OBW (Disposed of in the Expansion Permitted Footprint)[4]	67,994	Maine	8.1
4	Recycled/Reused CDD Processing Fines[1]	50,774	Maine	6.1
5	Mixed CDD	347,016	Maine	41.6
6	Recycled/Reused Wood from CDD[2]	248	Maine	0.0
7	Residue/Trash from Single Stream	8,239	Maine	1.0
	Special Wastes Types			
8	Burn Pile Ash and/or Hot Loads Area Ash	339	Maine	0.0
9	Burnt Structure Debris/Ash	350	Maine	0.0
10	Catch Basin Grit & Street Sweeping	559	Maine	0.1
11	Coal, Oil & Multi-fuel Boiler Ash	1,355	Maine	0.2
12	Contaminated Soil & Debris	4,095	Maine	0.5
13	Industrial (Miscellaneous)	131	Maine	0.0
14	Industrial WWTP Sludge	9,086	Maine	1.1
15	Leather Scraps	51	Maine	0.0
16	Lime Mud/Grit	1,168	Maine	0.1
17	MSW Incinerator Ash	2,619	Maine	0.3
18	Municipal WWTP/POTW Sludge	57,090	Maine	6.8
19	Non-Friable Asbestos	670	Maine	0.1
20	Non-Hazardous Chemical Related	723	Maine	0.1
21	Oil Spill Debris	2,191	Maine	0.3
22	Polyethylene & Cellulose Trimmings	145	Maine	0.0
23	Pulp Mill Waste	538	Maine	0.1
24	Sandblast Grit	244	Maine	0.0
25	Spoiled Foods	328	Maine	0.0
26	Sulfur Scrubbing Residues	699	Maine	0.1
27	Water/Air Filtration Media	7	Maine	0.0
28	WWTP Grit Screenings	574	Maine	0.1
SUBTOTAL WASTE TYPES 1-7		751,402	Maine	90.1
SUBTOTAL WASTE TYPES 8-28		82,961	Maine	9.9
GRAND TOTAL WASTE RECEIVED[3]		**834,363**	Maine	

1. Materials recycled/reused as alternative daily cover (ADC).

2. Wood from CDD was received at the Juniper Ridge Landfill wood storage facility then chipped and recycled/reused as ADC.

3. Total does not include construction materials. In 2023, 40,446.44 tons of Construction Fines were delivered from Resource in Lewiston. These fines were manufactured to meet construction specifications for the Stage 1 Final Cover and side slope grading requirements prior to installing synthetic intermediate cover. Total derived from sum of higher significant digit numbers, not rounded whole numbers as provided in the above table.

4. The previous limit of 65,000 tons per year, set by expansion license #S-020700-WD-BI-N, was modified through solid waste minor revision #S-020700-WD-CM-M. The minor revision approved the methodology and process used to determine JRL's annual OBW limit of 85,000 tons in the Expansion area for 2023. The approval was granted on 04-25-23.

5. CRM/MRC 61,279.69 tons, ecomaine 5,981.54 tons, PERC 185,328.99, MMWAC 13,861.54 tons.

Table 3-2 Disposal Capacity Remaining as of December 31, 2023

Cubic Yards (CY)	JRL Site Remaining Capacity as of December 31, 2023
	Constructed Area Capacity
502,983	2004 permitted footprint (Cells 1-10)
1,626,914	Expansion footprint (Cells 11-15)
2,129,897	**Total Constructed Area Capacity (Cells 1-15)**
3,226,500	**Total Permitted but Unconstructed Area Capacity (Cells 16-17)**
5,356,397	**Total Site Remaining Permitted Capacity (Cells 1-17)**

Further details are provided in Attachment I (the 2023 JRL Geotechnical Monitoring Report). Please refer to Appendix B.

3.3 Estimates of the Amount of Cover Material Placed

During 2023, the first stage of final cover was installed (Stage 1 Final Cover). The total acreage covered by the project was approximately 8.6 acres, which was primarily installed over the southern side slope of Cell 10. Installed above the final cover, is the beginnings of a road, which will be extended in future final cover projects, and will be utilized as a final road to the top of the landfill once the landfill is permanently closed.

Also installed throughout the year was a mixture of synthetic and soil intermediate cover. Materials were placed as final waste grades were reached. Approximately 8 acres of additional synthetic cover (40-mil) was added to the side slopes of Cells 14. Approximately 15 acres of soil cover was added to the top/upper side slopes of Cells 13/14 and on the top of the 2004 permitted footprint.

During daily operations, active areas received alternate daily cover (ADC). Approved ADC materials utilized throughout the year included: recycled/reused CDD processing wood fines, clean recycled/reused wood from CDD after being chipped, soil equivalent foam (seasonal), and virgin soil when other ADC materials were lacking or unavailable. Total ADC usage of recycled/reused materials amounted to 51,022 tons in 2023. Approximately 35,604 cubic yards of virgin soil (primarily sand) was used when recycled/reused materials were unavailable, or soil equivalent foam wasn't feasible due to cold weather.

3.4 Summary of Changes to the Facility's Operations Manual

Included as Attachment C are updated sections to include to the JRL Expansion Operations Manual (April 2023). Once included, the Operations Manual will be complete and will be considered the April 2024 revision. The updated sections for the 2024 revision are listed below:

- Binder Cover/Spline Labels
- JRL Expansion Operations Manual Narrative Section
- Appendix A - MEDEP Operating Permits
- Appendix C - Operator Training Program Outline
- Appendix D - Cell Development Plans for Cell 16 (to add to previous cell plans)
- Appendix I – Environmental Monitoring Plan

3.5 Proposed Changes to the Operations Manual or Other Landfill Operations

During 2024, JRL staff plan to continue updating the revised April 2024 JRL Expansion Operations Manual as changes arise. Changes in 2024 will likely include the addition of Cell 16, Stage 2 Final Cover, and the RNG Facility.

In 2024, JRL will continue filling/shaping Cell 15 and the north slope of the 2004 permitted footprint, until Cell 16 is constructed.

3.6 Responses to Spills, Fires, Accidents or Unusual Events at the Landfill

During 2023, the JRL facility experienced three petroleum related spills, four fires, and two other waste related events. Damage to synthetic intermediate cover and the liner system was also repaired in 2023. Descriptions of events are described below. All spill was properly cleaned up by JRL Staff.

Petroleum Related Spills

Three small petroleum related spills occurred in 2023. All were 5 gallons or less and caused by 3rd party hauler's equipment. The MEDEP spill hotline was contacted, and spills were properly cleaned up using spill pads and speedy dry. Once absorbed, the material was disposed of in the landfill.

Non-Waste Related Fires

Two on-site non-related waste fires occurred during 2023. The are described below.

- On 02-05-23 at 4:30 AM, JRL overnight staff noticed a grass/hay fire around the base of the LFG flare. The area burned was approximately 400 ft^2 and was put out by JRL Staff with a fire extinguisher. Some loose stockpiled piping, composite material, and an outhouse in the area were damaged. The materials lost belonged to an on-site contractor.

- On 09-18-23 at 12:20 PM, an engine compartment of packer truck owned by a 3rd party caught fire. The fire occurred along the landfill access road and was fought by JRL personnel with fire extinguishers until the Old Town Fire Department could arrive. The fire was contained to the engine compartment of the truck. No trash, fuel, or oils were released. The truck was haul off-site and no injuries were sustained. The load of trash was not dumped at the landfill immediately following the fire.

Waste Related Fires

Two on-site waste related fires occurred during 2023. Details are described below.

- On 05-15-23 at 7:45 PM JRL overnight staff noticed a fire on the northeast working face and side slope of Cell 14. The fire was fairly large (approximately 2.25 acres) and burned various disposed materials. At no time did the fire come close to the landfill liner system. The fire was isolated to the top and upper portion of the slope. JRL staff were called in to assist, along with the Old Town Fire Department, Thornton's Construction, Sargent Corporation, and several other smaller fire departments for support. At roughly 12:30 AM on 05-16-23, the Old Town Fire Department was dismissed because the spread of fire was under control. By 5:00 AM no open flames remained, and the area was covered with soil.

  This was a valiant effort from all parties involved. No one was hurt, no equipment lost, and no damage occurred to the landfill liner system. The MEDEP Project Manager was notified morning of 05-16-23 and walked the area with JRL staff. The landfill was open for business with only a one-hour delay, at 7:00AM on 05-16-23. The cause of the fire is unknown, but likely started in the active working area.

- On 06-16-23 at 10:00 PM JRL overnight staff noticed a smaller fire (approximately 900 ft^2) on the top/center of the working face in Cell 14. The cause of the fire is

unknown but started in the active working area. JRL staff responded and put the fire out in roughly 2 hours. 8 loads of on-site soil were used to smother and cover the area. The MEDEP was notified at 8:25 AM on 06-19-23. Due to the holiday follow-up calls were made the on 06-20-23.

Waste Related Events

Two on-site waste related events occurred during 2023. Details are described below.

- On February 22 it was determined that waste in Cell 14 had not been sufficiently stabilized due to insufficient available bulking waste and large amounts of disposed municipal wastewater treatment plant sludge (Sludge). The area of the landfill needed to be remixed to achieve stability. Equipment operators were having difficulty maneuvering their heavy equipment.

  This remixing took place starting Feb. 23 and ended on the 24th. The complete suspension of acceptance of Sludge lasted two days. Acceptance of Sludge for disposal at JRL slowly began to resume on February 27 and was increased during the first week of March. No one was injured and the landfill infrastructure remained unharmed. 3rd party engineers evaluated the area once the area had been remixed and confirm it to be stable. JRL staff monitor sludge intake daily to prevent recurrence. MEDEP was notified.

- On 09-07-2023 a load of unacceptable material arrived at JRL. The load was reloaded and sent back to where it came from. The MEDEP was notified as required.

Damaged Intermediate Cover/Liner System

No large areas of synthetic intermediate cover were damaged due to the wind in 2023. Several small areas did require repair along with damaged around landfill gas (LFG) infrastructure. 3rd party crews were called in to make necessary repairs. JRL site personnel continuously try new things to better secure the cover material to prevent reoccurrences.

One liner system repair occurred on the outer berm of Cell 15 during 2023. Repairs were made by original installers with 3rd party engineering QA/QC on-site. MEDEP was notified of the occurrence.

3.7 Updated Cell Development Plans

Cell 11, 12, 13, 14, and 15 plans will remain in the JRL Expansion Operations Manual, along with the future plans for Cell 16. Cell 16 is set to be constructed during the 2024 construction season and will represent the sixth cell of the 9.35 million cubic yard permitted expansion.

3.8 Copies of Reports Prepared in Accordance with the Landfill's Hazardous and Special Waste Handling and Exclusion Plan

During 2023, JRL submitted monthly special waste activity reports to the BGS, the City of Old Town, and the MEDEP. Reports were also and placed on the BGS's JRL website for the public and the Landfill Advisory Committee to access.

3.9 Inspections and Testing

During 2023, JRL personnel performed routine inspections of the landfill and infrastructure as outlined in the JRL Operations Manual. Copies of quarterly (routine) and weekly inspection reports may be found on file in the Environmental Manager's Office. Completed sample inspection sheets are included in Attachment D of this Annual Report.

3.10 Description of System Failures and/or Repairs

Routine and non-routine maintenance activities were performed on the leachate and landfill gas collection infrastructure, access roads, stormwater structures, and cover systems during 2023. Leachate maintenance activities are listed chronologically in Attachment E. A summary of other identified landfill maintenance activities are listed in Attachment D.

During report year 2023, the following routine maintenance and/or repair functions were performed at the facility:

- Leachate maintenance and cleaning activities occurred as needed and in accordance with the Facility's Operations Manual;
- On-site stormwater structures were cleaned and/or repaired in accordance with standard BMP's to maintain erosion & sedimentation control during rain events;
- Various repairs were made to the existing 30/40-mil intermediate cover systems due to tears, rips, and/or holes from movement, settlement, or wind;
- Gas collection piping was repaired in multiple locations to accommodate for normal settlement and operations;

- Landfill gas (LFG) wellheads were repaired throughout the year due to normal wear and tear; and
- Access roads were graded and maintained as necessary to allow access to the facility.

4.0 FACILITY SITE CHANGES

During 2023, the following minor facility site changes not requiring Department approval occurred and are once again planned for 2024:

- Mowing, brush cutting, and other site maintenance upkeep;
- Continued safety and visual upgrades of the landfill paved access road;
- Continued improvements to stormwater control systems; and
- Continued efforts to mitigate wind-damage of landfill synthetic intermediate cover materials.

5.0 MONITORING

Water Quality

The 2023 Annual Water Quality Report for JRL is included as Attachment F of this report and includes an evaluation of the environmental monitoring data for the JRL site. During 2023, water quality samples were collected at JRL in accordance with the Environmental Monitoring Program (EMP), during April, July, and October.

Leachate Quality

Leachate quality was also evaluated and included as part of the 2023 Water Quality Report, Attachment F of this report.

Below in Table 5-1, are leachate volumes of each pump station, along with total leachate hauled for 2022 and 2023. As seen, leachate flows increased overall for 2023. This increase was likely attributed having a larger active working area, less synthetic intermediate cover installed on the north end of the 2004 permitted footprint, and higher than average rainfall throughout the year.

Table 5-1 Leachate Total Comparison, 2022 & 2023

Total Leachate Pumped By Cell Pump Stations					
	Cell 4	Cell 5	Cell 8	East Side Cells 11-14	West Side Cell 15
2022	8,710,640	2,572,740	3,735,325	2,781,720	0
2023	11,348,465	3,953,780	4,052,985	5,291,615	416,230
Difference	23%	35%	8%	47%	100.00%

Total Leachate Produced (Hauled) By Month			
	2022	**2023**	**Difference**
January	893,430	2,023,640	56%
February	2,342,600	2,278,695	-3%
March	1,911,800	2,002,340	5%
April	1,677,040	1,410,090	-19%
May	1,472,740	1,618,625	9%
June	1,047,440	2,056,070	49%
July	715,570	1,877,845	62%
August	1,395,545	2,902,795	52%
September	1,317,905	2,011,375	34%
October	1,798,575	2,881,385	38%
November	2,161,570	2,051,655	-5%
December	2,183,275	3,417,010	36%

Landfill Gas Monitoring

The 2023 Landfill Gas Monitoring Evaluation for JRL is included as Attachment G of this report. This routine landfill gas monitoring took place at various on-site gas management locations with results being submitted via electronic deliverable documents to the MEDEP as required.

The 2023 monitoring data associated with the landfill gas collection and treatment system indicates that the system is operating in accordance with the facility's air license.

Air Monitoring

The 2023 Air Monitoring Evaluation for JRL is included as Attachment H of this report. Two types of air monitoring activities occurred on-site during 2023: (1) hydrogen sulfide (H_2S) monitoring with stationary continuous monitors, and (2) quarterly methane (CH_4)

emission surface scans on the landfill intermediate cover. Additionally, odor complaints from the 24-hour JRL odor complaint hotline provided an opportunity to evaluate the effectiveness of odor control measures at the JRL.

Geotechnical Monitoring

The 2023 Annual Geotechnical Monitoring Report for JRL is included as Attachment I of this report. During 2023, JRL continued to monitor site settlement and stability as in the past with the assistance of Dr. Richard Wardwell.

The report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and the Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application for a new solid waste license, as approved by the MEBEP under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017.

Results of this monitoring verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2023). Specifically, geotechnical monitoring during 2023 included: (1) visual observation of landfill slope stability, settlement, and general landfill conditions, (2) assessment of site aerial topographic surveys; (3) a review of waste types, quantities, location of waste placement, and filling sequences, and (4) evaluation of fluid levels in the leachate collection layer of Cells 11, 12, 13, 14, and 15.

6.0 FINANCIAL ASSURANCE

The closure and post-closure costs have been recalculated to reflect those Cells that, as of the end of calendar year 2023, have been or will be constructed, but have not received final cover. A copy of the revised closure and post-closure costs may be found in Attachment J of this report. Following approval of the estimates, a revised financial assurance package will be submitted to the MEDEP under a separate cover.

7.0 MSW DIVERSION

In accordance with Condition #5 of Solid Waste Order #S-020700-WD-BC-A, a summary of best efforts by CWS to divert MSW from landfilling at JRL to the greatest extent practicable has been completed and may be found in Attachment K of this report.

ATTACHMENT A

Compliance Self Audit

JUNIPER RIDGE LANDFILL
COMPLIANCE SELF-AUDIT EVALUATION
REPORT YEAR 2023

This Compliance Self-Audit Evaluation is to be used to perform an annual audit of landfill operations as required by of Chapter 401, Section 4.D. (1) (b) of the State of Maine Solid Waste Management Rules. The purpose of this audit is to verify general compliance with the site operations manual, licenses and regulatory requirements. Qualified facility personnel performed the audit.

Facility Name…….	**Juniper Ridge Landfill (JRL)**
Location……..	**Old Town, Maine**
Audit for Calendar Year…..	**2023**
Compliance Auditor……..	**Jeffrey M Pelletier**
Title…….	**Environmental Manager**
Signature of Auditor…….	

GENERAL EVALUATION:

1. Are active facility licenses kept on file at the facility?

Copies of active MEDEP licenses may be found in the Environmental Manager's office located at Pine Tree Landfill. Licenses are also available electronically to the landfill supervisor and staff at the JRL site.

2. Do the facility licenses have special license conditions relating to landfill operations?

Yes, a number of conditions are laid out in various licenses held by the facility. MEDEP licensed conditions are entered into a company Environmental Compliance Database that allows the division manager and compliance manager to monitor compliance with submission deadlines and fee requirements.

3. What pending licenses or approvals were sought from the MEDEP at the time of this audit.

- Stage 2 Final Cover Design (submitted 12/29/23)
- 2024 Annual Oversized Bulky Waste Limit Request Form submittal (pursuant to Condition 2 (D) of Solid Waste Minor Revision License #S-020700-WD-CM-M) (submitted 01-26-24).
- Part 70 Air License A-921-70-I-A
- JRL Proposed Sampling of RNG Condensate
- Cell 16/17 Tree Clearing Maine Construction General Permit NOI

4. Date of payment of MEDEP Annual Report/License Fees.

- MEDEP 2023 annual report fee invoice will be paid once received.
- MEDEP 2023 annual license fee of $17,340.00 was paid on July 13, 2023.

5. Date of submittal of previous MEDEP Annual Report & Report/License Fees.

- MEDEP 2022 annual report was submitted on April 28, 2023.
- MEDEP 2022 annual report fee of $4,488.00 was paid on March 16, 2023.
- MEDEP 2022 annual license fee of $15,991.00 was paid on July 19, 2022.

6. Does the facility have a Host Community Agreement in-place and on file?

A Host Community Compensation and Facility Oversight Agreement was signed with the City of Old Town on December 8, 2005. Although not a host community, a Community Benefits Agreement also was signed with the Town of Alton on October 6, 2005. Copies of these agreements may be found in the Division Manager's Office.

7. Does the facility have a current liability insurance policy in-place and on file at the facility?

Yes, a copy of the policy is available in the Division Manager's Office.

8. Has the facility submitted an executed financial assurance instrument for closure and post closure care along with updated closure/post closure cost estimates to the MEDEP?

Yes, performance bonds were initially provided to the MEDEP on February 19, 2004. An updated financial assurance package for the closure/post-closure care is provided to the MEDEP within the annual report.

9. Last date a certified copy of the facility Operations Manual was updated.

An update to the JRL Expansion Operations manual was distributed in April 2023 alongside the 2022 Annual Report.

10. MEDEP approval date of last updated Operations Manual.

The facility Operations Manual was formally approved on June 01, 2017 as part of Solid Waste Order #S-020700-WD-BI-N.

11. Number and locations of the Certified Copies of the Operations Manual.

Certified copies of the Operations Manual may be found at the following locations:

- The Augusta Office of the MEDEP
- The Municipal Office of the City of Old Town
- JRL's Environmental Compliance Manager's Office
- JRL's Operations Supervisor's Office
- Manager of State Landfills at the Maine Bureau of General Services

12. Operational personnel who received landfill training during audit year.

During 2023, operations personnel received monthly training sessions on a variety of topics relating to safety, environmental compliance, and landfill operations. Records relating to the ongoing training of landfill personnel are kept on file in the Landfill Operation's Managers office.

13. Are only solid wastes or special wastes as allowed in the landfill's current license accepted and are those wastes handled as described in the landfill's Operations Manual?

Yes, only approved non-hazardous special and solid wastes from Maine are being accepted at JRL and are being characterized according to the conditions laid out in the facility's Waste Characterization Plan.

14. Are solid wastes and special wastes permitted for acceptance characterized on an ongoing basis in conformance with the characterization plan approved by the Department?

Yes, those wastes are being characterized at the required intervals and/or tonnage rates. Records associated with waste acceptance are kept on file electronically.

15. Is access to the facility controlled so that the public is not exposed to potential health and safety hazards and access is only permitted when an attendant is on duty?

Yes, an attendant is located at the scale house during operational hours. During non-operational hours the facility is manned by security personnel that perform regular site inspections. For public safety reasons, non-employee visitors entering the site during operational hours must first stop at the scalehouse and check in prior to further entry. The site is secured with fencing. Doors and gates around the site are secured unless in use.

16. Are the hours of operation and other limitations for access and use prominently posted at the entrance to the landfill?

Yes, the facility has the required signage in-place at the entrance to the landfill prior to and at the scale house. Additional signage is placed in prominent areas throughout the landfill.

17. Are the access roads within the facility maintained?

Yes, roads from the entrance to the active landfill are maintained year-round to accommodate passage of vehicles.

18. Are any access roads into the active cell of the landfill constructed and maintained to prevent migration of leachate outside of the cell.

Yes, the main access road into the active cell is designed to prevent leachate from migrating outside of the cell.

19. Is a road maintenance program appropriately implemented to prevent the accumulation of dust, mud, or wastes from the facility access, public, or private roads?

Yes, paved roads are mechanically swept, scraped, and/or plowed as needed to prevent accumulation of undesirable material on the roads. Roads are additionally watered seasonally as necessary as a further dust control measure.

20. Are the appropriate signs posted or other approved means implemented to indicate clearly where solid waste is to be unloaded and the location of any separate handling areas?

Yes, drivers are directed by the scale house attendant and/or landfill operators to the proper staging/unloading area where they are then given further instructions via radio communications with the operators. Delivery vehicles utilizing the site are required to be equipped with a means of radio communication. Hand-held radios are made available as needed.

21. Are the setbacks and buffer strips approved by the Department being maintained?

Yes, required setbacks and buffers are being maintained as required.

22. Are the cell development plans up-to-date and submitted with the annual report?

Yes, cell development plans are included as part of the updated operations manual section. Cell 16 plans will be added since construction will begin throughout the 2024 construction season.

23. Is compaction performed at least once per operating day and more often as necessary unless otherwise approved by the Department?

Compaction is currently being achieved at JRL with the use of compactors that are operated in a manner to achieve favorable compaction rates.

24. Has cover been placed as outlined in the operations manual?

Yes, suitable waste materials, (i.e., alternate daily cover) are primarily being utilized as daily cover as necessary. Intermediate soil/synthetic cover materials are being installed as slopes reach appropriate elevation & grades.

25. Have storm water management and erosion control measures been implemented as outlined in the operations manual?

Yes, storm water management & erosion control measures are being utilized as outlined in JRL's Storm Water Pollution Prevention Plan, located in the Operations Manual.

26. Are leachate management systems including collection, transport, storage, and pumping systems maintained in accordance with the site Operations Manual?

Yes, systems receive regularly scheduled maintenance and are inspected at pre-determined intervals in accordance with the site Operations Manual.

27. Are landfill gas systems installed and maintained as outlined in the Operations Manual?

Yes, the landfill maintains an active gas collection system consisting of horizontal gas collection piping, vertical wells, and a flare.

28. Is a methane gas-monitoring program implemented to verify the concentration of explosive gases generated by the landfill, and if an exceedance is triggered, appropriate steps are taken to protect human health and the Department notified of the occurrence and the protective steps that were taken?

Yes, methane gas monitoring is being performed as required at the groundwater quality wells, landfill surfaces, at landfill structures, and LFG wellheads as required. The facility has developed a plan of action that needs to be followed should elevated levels be detected. Elevated levels of H2S (a separate component of LFG) were detected in 2023 and reported as required.

29. Are routine inspections of the landfill facilities performed as outlined in the Operations Manual, and are records of the inspections kept on file at the facility?

Yes, routine inspections are performed at pre-determined frequencies in compliance with the site Operations Manual, with records of inspections kept on file in the Environmental Manager's office.

30. Does the facility have a fire protection plan in-place and is it outlined in the operations manual?

Yes, fire protection procedures are located in the JRL Operations Manual, and are being followed as required.

31. Does the facility have a hazardous and special waste handling and exclusion plan and is it implemented at the facility?

Yes, the hazardous and special waste handling and exclusion plan may be found in the Operations Manual. Appropriate response procedures are followed as required.

32. Does the facility have a litter control plan and is it implemented as outlined in the Operations Manual?

Yes, the facility controls off-site litter through the use of strategically placed fencing and regular litter patrols.

33. Has the Environmental Monitoring Program been implemented as outlined in the Operations Manual?

Yes, requirements as laid out in the environmental monitoring plan are being adhered to and are located in the Operations Manual.

34. Environmental sampling events being conducted as required and results reported to the MEDEP.

A record of environmental sampling events with corresponding dates may be found in the annual water quality report being submitted to the MEDEP as part of the Annual Report. Site water quality monitoring was completed on a tri annual basis in April, July, and October, with monitoring reports from those events submitted to the MEDEP. Required landfill leachate PFAS testing was completed in the spring and fall of 2023 and reported to the MEDEP on 02-16-23 and 11-14-23 respectfully.

35. Are waste staging and storage areas maintained as outlined in the Operations Manual?

Yes, staging and storage areas are being operated and maintained in accordance with the site Operations Manual.

36. Is a vector control program in-place and implemented as outlined in the operations manual?

Yes, a pest control service regularly visits the site and maintains control devices. Additionally, the facility utilizes lethal & non-lethal means of deterring bird populations.

37. Does the facility accept asbestos wastes?

The facility is only licensed to accept non-friable asbestos containing wastes and manages the material in a manner that minimizes exposure during offloading.

D-2 JRL Other Maintenance Activities

Weekly/Monthly Site Inspection Reports

WEEKLY/MONTHLY INSPECTION FORM

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	08-10-2023
Inspector Name/Signature	Luigi S. Pizzuti

Note: For weekly inspections, only Table 1 and Table 3 need to be completed. For monthly inspections, Tables 1, 2 and 3 need to be completed.

Table 1
Inspection of Active Areas at the Facility

Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☒ Yes ☐ No	☒ Comments (see below)
Borrow Pit	Is there evidence of tracking or erosion from site soil borrow areas with potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Mobile Equipment	Is mobile equipment leaking oil or other liquids with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)

Active Areas at the Facility	
Comments	Some trash and sediment in stormwater conveyance ditches near landfill access roads. Need to be cleaned out.

Table 2
Inspection of Stabilized Areas at the Facility

Stabilized Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☒ Yes ☐ No	☒ Comments (see below)
Comments	See comments above. Also other stormwater conveyance ditches need to be cleaned of trash and sediment.		

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Detention Pond 1	good
Geomembrane Lined Storage Pond	good
Detention Pond 2	good
Detention Pond 6	good
Litter Fence	litter fence along east access road has some holes in it. Working but could eventually use repair.
Lechate Storage Tank Containment Area	good
Leachate Storage Tank Containment Area Riprap Outlet	good
Leachate Loading Rack Catch Basin	good
Detention Pond 9	good
2,000-Gallon Underground Storage Tank	good
Detention Pond 5	good
Outfall No. 1	good
Outfall No. 2	good
Outfall No. 3	good

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Outfall No. 4	Good
Outfall No. 5	Good
Outfall No. 6	Good
Outfall No. 7	Good

Table 4

CORRECTIVE ACTION REPORT

Site Name/Company: JRL Landfill	
Location: Old Town, ME	
Contact Name: Luigi Pizzuti	**Contact Signature:**
Date of Discovery: 08-10-2023	
Date of Corrective Action Initiation: 08-10-2023	
Date of Corrective Action Completion: 08-18-2023	
Condition Requiring Corrective Action	Clean out trash and sediment from east side road drainage conveyances
Immediate Measures Taken to Control	Trash removed and drainage conveyances cleaned.
Measures Taken to Prevent Re-Occurrence	Keep up with maintenance of drainage conveyances.

Corrective actions must be completed within 14 days of the discovery of the condition. SWPPP modifications must be completed within 14 days of the completion of the corrective action. In the case of a spill, fill out Appendix E – Spill Report in addition to this form.

If it is not feasible to complete the corrective action within 14 days, please describe the reason and proposed schedule for completion: _____

_____

_____

If corrective actions cannot be completed within 45 days of discovery, MEDEP must be notified.

Site Inspection
Reports

ROUTINE INSPECTION REPORT

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	11-18-23
Inspector Name/Signature	Jeffrey Pelletier /
Weather	Raining

Does this inspection qualify as the one required annual inspection conducted during qualifying storm event? ☒ Yes ☐ No

Are there any new discharges or pollutants at the site? ☐ Yes ☒ No

Table 1
Inspection of Potential Pollutant Sources (PPS)

	Description
Industrial Activity or Area	**Describe where any of the following were observed:** • **Any discharges present at the time of inspection;** • **Any evidence of pollutants entering the drain system or outfalls;** • **The condition of the outfalls, including any restricted flow;** • **Industrial materials, residue or trash on the ground;** • **Leaks or spills from industrial equipment, drums, barrels, tanks or other containers;** • **Offsite tracking of industrial or waste materials or sediment; and** • **Tracking or blowing of raw, final, or waste materials.**
Scale House and Scale	Scale Area Clean + orderly
Soil Stockpile Areas	Good, piles recently mulched + seeded
Borrow Pit	Good, Area recently mulched + seeded
Wood Waste Handling Area	Began chipping wood pile. Contained to area. Overall looks good
Maintenance Building	Overall looks good + well organized.

Table 1
Inspection of Potential Pollutant Sources (PPS)

Rubb Building	Looks good
LFG Treatment Facility	Looks good
RNG Facility	Under construction but Archaea is doing a good job to minimize Stormwater impacts. Good
Leachate Storage Tank	No evidence of leaks, looks good
Leachate Loading Rack	No evidence of leaks, looks good
Leachate Collection System	Good, System seems to be working as intended
Gravel Laydown Area	well organized
Employee Parking Area	Good, no issues
1,500-Gallon Gasoline Tank	Good, no signs of leaks, containment empty.
2,500-Gallon Diesel Delivery Truck	Good, no signs of leaks
Access Roads	Good, recently graded on South end, Paving access road scheduled soon. Light litter along couple areas along the Landfill perimeter road.

Table 2
Inspection of Structural Control Measures and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly; • Any evidence of erosion; and • Industrial materials, residue, or trash.
Detention Pond 1	Good, recently upgraded
Geomembrane Lined Storage Pond	Good, functioning properly
Detention Pond 2	Good, functioning properly
Detention Pond 6	Good, functioning properly
Litter Fence	Good
Leachate Storage Tank Containment Area	Good, empty no signs of leaks
Leachate Storage Tank Containment Area Riprap Outlet	Good, functionly properly
Leachate Loading Rack Catch Basin	Good, functioning properly
Detention Pond 9	Good, functioning properly
2,000-Gallon Underground Storage Tank	Good, functioning properly, no signs of leaks
Detention Pond 10	Good, functioning properly
Detention Pond 11	Good, functioning properly
RNG Facility Stormwater Pond	Good, functioning properly

Table 2
Inspection of Structural Control Measures and Outfalls

Outfall No. 1	good, pretty clear flow today, working as intended
Outfall No. 2	good, pretty clear flow today, working as intended
Outfall No. 4	good, no flow yet today but looks good.
Outfall No. 5	good, clear flow today, working as intended
Outfall No. 6	good, pretty clear flow, working as intended
Outfall No. 7	good, pretty clear flow, working as intended

Table 3
Corrective Actions Required for PPS(s) and/or Existing Structural Control Measures

CORRECTIVE ACTION REPORT

Site Name/Company:	Juniper Ridge Landfill
Location:	2828 Bennoch Road, Alton, ME
Contact Name: Jeffrey Rellstab	**Contact Signature:**
Date of Discovery:	11-18-23
Date of Corrective Action Initiation:	11-20-23
Date of Corrective Action Completion:	11-28-23
Condition Requiring Corrective Action	Light litter along a couple Areas along the landfill perimeter road and the road near the entrence of Cell 5
Immediate Measures Taken to Control	Informed Site Supervisor/Environmental Analyst. Pickers Scheduled.
Measures Taken to Prevent Re-Occurrence	Stay on top of litter patrols.

Corrective actions must be completed within 14 days of the discovery of the condition. SWPPP modifications must be completed within 14 days of the completion of the corrective action. In the case of a spill, fill out Appendix E – Spill Report in addition to this form.

If it is not feasible to complete the corrective action within 14 days, please describe the reason and proposed schedule for completion: _____

_____

_____

If corrective actions cannot be completed within 45 days of discovery, MEDEP must be notified.

QUARTERLY VISUAL MONITORING FORM

2023 Juniper Ridge Landfill Other Maintenance Activities

Below is a list of all other maintenance activities that occurred throughout 2023. A list of all leachate maintenance and cleaning activities is chronologically listed in Attachment E of the 2023 JRL Annual Report.

Access Road Maintenance	
●	Access roads going to the top of the landfill and around the north, west, and south sides of the landfill perimeter were graded as necessary.
●	All access roads were swept and watered as necessary.
●	Paving was completed along the main access road to repair potholes.
Landfill Cover System Maintenance	
●	Various repairs were made to the existing 30/40 mil intermediate cover system due to tears, rips, and holes from liner movement, settlement, and the wind.
Landfill Gas System (LFG) Maintenance	
●	Roughly 134 improvements were made to the LFG system throughout 2023. These improvements included: well/gas collection trench installations/extensions, maintenance to all collection well head components (valves, ports, hoses), and torn well boots.
●	The flare flame arrestor was cleaned periodically.
●	Routine maintenance was performed at the JRL Thiopaq Facility in accordance with the Facility's operations manual.
●	Condensate knockout pots (KOP) were cleaned as necessary.
Other Site Maintenance	
●	A new portion of overhead electrical was installed on the northwest side of the landfill. This was completed to allow electrical service to future landfill expansion cell pump stations.
●	Third party contractors were used to mow around the landfill perimeter, along access roads, and along security fencing.
●	Archaea contractors building the RNG facility performed regular clean up while buiding the new facility.
Scale House Maintenance	
●	Gravel along the road shoulders was graded periodically.
●	Scales were cleaned, de-iced, and calibrated as necessary.
Stormwater Maintenance	
●	All stormwater ditches around the landfill were cleaned routinely. Culverts were cleaned and new rip-rap was installed as necessary.
●	New erosion control mix was added around the level lip spreader and prior to Outfall #2.
●	Seeding and mulching occurred as necessary to prevent erosion.
●	Continuous litter patrols were performed by 3rd party temporary personnel.

ATTACHMENT E

Leachate Collection Maintenance Activities

2023 Juniper Ridge Landfill Leachate Maintenance and Repairs	
1/19/2023	Replaced 10 HP motor on Pump #1 in Cell 14 Pump Station.
1/31/2023	Replaced 1/2 HP VFD and 1/2 HP pump end in Cell 14 leak detection.
2/9/2023	Replaced wire leads on 10 HP motor on Pump #1 in Cell 14 Pump Station.
5/24/2023	Flow meter verification was performed on the leachate loadout rack and pump stations.
7/10/2023	Replaced 10 HP pump end and motor on Pump #2 in Cell 14 Pump Station.
09/21/23	Cleaned various manhole structures for force main around perimeter of landfill.
09/22/23	Cleaned leachate collection (LC) lines around the landfill for Cells 10 through 15.
11/10/23	Located and marked leachate collection line on the backside of the landfill.

Additional Items Completed:

Surface water was checked and removed from the leachate force main manholes at least Quarterly throughout 2023. At that time force mains infrastructure and pressure gauges were inspected. The force main was also looked at throughout the year for cleanliness

2023 ANNUAL WATER QUALITY REPORT
JUNIPER RIDGE LANDFILL

1.0 INTRODUCTION

The Juniper Ridge Landfill (JRL or site) is a secure landfill located on a 780-acre parcel in Old Town, Maine. It is owned by the Maine Bureau of General Services (BGS) and is operated by NEWSME Landfill Operations, LLC (NEWSME). Since 2004, JRL has been an integral part of the State of Maine's overall solid waste management program, providing environmentally sound disposal capacity for non-hazardous solid waste generated throughout the State of Maine. Figure 1-1 shows the location of the site. Figures 1-2 and 1-3 show the general site layout and monitoring locations of the site in 2023.

Water quality has been monitored at the site since 1990 when the site was first selected for a landfill.[1] This report describes the results of the water quality sampling and an analysis of site water quality in 2023 completed by Sevee & Maher Engineers, Inc. (SME). The analysis compares the 2023 results to historical water quality at the site, using statistical and graphical evaluations of trends in the data by sample location, and to State and Federal water quality standards. The analysis also looks at the water quality data in terms of the site conditions that exist at the JRL.

1.1 2023 Monitoring Activities

Sampling during 2023 was completed in general accordance with the current Environmental Monitoring Plan (EMP) for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017).[2,3] Descriptions of the 2023 water quality monitoring results are provided in this report.

Following one round of monitoring in October 2022, baseline monitoring for downgradient landfill expansion monitoring wells MW-508, OW-610A, P-04-07A, and P-04-07B was completed during the winter and spring of 2023 and these wells began to be monitored under the current EMP specifications during the summer 2023 sampling round. In July 2023, SME began monitoring LF-LD-14 for field parameters and parameters in the detection monitoring program. NEWSME began monthly monitoring

[1] The JRL was formerly known as the West Old Town Landfill and was owned and operated by Georgia-Pacific (previously known as Fort James and James River Paper Company) as a secure, non-hazardous, generator-owned waste disposal facility. A comprehensive description of the site setting and hydrogeology is contained in the 1991 report by SME entitled: *James River Paper Company Inc., West Old Town Landfill Project, Old Town Maine, Volume III, Site Investigation and Hydrogeologic Evaluation, August 1991*).

[2] SME, April 2016, Environmental Monitoring Plan, Juniper Ridge Landfill, Old Town, Maine, Prepared for NEWSME Landfill Operations LLC, Revised April 2016.

[3] SME, June 2017, Juniper Ridge Landfill Expansion Application Environmental Monitoring Plan, Submitted by: State of Maine Bureau of General Services, as Owner and NEWSME Landfill Operations, LLC, as Operator, July 2015 (Revised June 2017).

of field parameters at LF-LD-15 (Cell 15 leak detection system) in July 2023. SME began monitoring LF-LD-15 for field parameters in accordance with the EMP in October 2023 and will obtain the first laboratory samples during the summer 2024 monitoring round. Downgradient landfill expansion surface water monitoring location SW23-4 and pore-water sample monitoring location PWS-4 began to be monitored under the current EMP specifications during 2023 for field parameters and parameters in the detection monitoring program.

Descriptions of the site setting, facility layout, monitoring locations, analytical parameters, and 2023 site activities are included herein.

1.2 2023 Landfill Conditions

The JRL is designed and constructed as a secure waste disposal facility in that the groundwater beneath and adjacent to the site is protected by a composite liner and a leachate collection system. Leachate generated at the site in 2023 was collected and stored in an on-site storage tank and then transported to either the MEDEP licensed wastewater treatment facility at the Old Town Mill owned by Nine Dragons Paper or the Anson Madison Sanitary District for treatment.

Cells 1, 2, 3A, 3B, 4, 5, 6, 7, 8, 9, and 10 account for the 68-acre landfill approved by the Maine Department of Environmental Protection (MEDEP) Solid Waste Order #S-020700-WD-N-A. A landfill expansion was approved by Board Order #S-020700-WD-BI-N and includes expansion Cells 11 through 17. Cells were constructed as needed for landfilling activities during the years listed below:

- Cell 11 in 2018,
- Cell 12 in 2020,
- Cell 13 in 2021,
- Cell 14 in 2022, and
- Cell 15 in 2023.

Cell 15 construction activities included site grading, construction of the landfill perimeter dike and pump station, and modifications to perimeter stormwater drainage ditches west and north of the landfill. Intermediate cover and landfill gas collection piping and wells were installed within several areas of the active landfill cells in 2023.

Waste filling in 2023 occurred primarily in Cells 7, 8, 9, 12, 13, 14, and began in Cell 15.

2.0 SITE HYDROGEOLOGIC SETTING

Cells 1 through 10 of the JRL facility are located on the southwestern side of a northwest-southeast trending drumlin. The natural topography in the landfill area slopes downward to the southwest towards a large wetland and an unnamed stream that empties into Pushaw Stream (Class B). Pushaw Stream empties into the Stillwater River (Class B), which flows to the Penobscot River (Class B). Groundwater beneath Cells 1 through 10 of the landfill is interpreted to follow the natural surficial topography and therefore predominantly flows towards the southwest and ultimately discharges to wetlands to an unnamed tributary to Pushaw Stream on the western portion of the site. The large change in elevation from northeast to southwest across the landfill area results in upward groundwater seepage gradients near the unnamed stream and wetland area. Horizontal groundwater seepage gradients on the western side of the stream indicate that groundwater also moves from the west towards the stream; thus, the stream acts as a hydrologic barrier for groundwater flow from the landfill beyond the east side of the stream.

Cells 11 through 14 of the landfill expansion are located along the north-northeast side of the northwest-southeast tending drumlin. Cell 15 is located on the northwest side of the drumlin. Groundwater beneath Cells 11 through 14 of the landfill is interpreted to follow the natural surficial topography and therefore predominantly flows towards the north and northeast and ultimately discharges to wetlands and a northerly unnamed tributary to Pushaw Stream. Groundwater beneath Cell 15 (as well as the locations proposed for Cells 16 and 17) of the landfill is interpreted to follow the natural surficial topography and therefore predominantly flows towards the northwest and west and ultimately discharge to wetlands and the westerly unnamed tributary to Pushaw Stream.

The site is underlain primarily by glacial till with marine clay of the Presumpscot Formation in the lower topographic areas (e.g., the wetlands in the southwestern portion of the site). Throughout the site, the glacial till generally consists of a very dense brown till grading to very dense gray till with depth. The till typically ranges from 20 to 50 feet thick beneath the landfill and thus provides a natural containment layer for the landfill. At a few locations outside of the landfill boundary, bedrock outcrops are exposed at the ground surface. In addition, there are several isolated, discontinuous, washed till zones found beneath the till. However, these discontinuous washed till zones are often found within finer grained glacial tills.

Bedrock beneath the facility has been identified as a light gray and brown metagraywacke and metaquartzite interbedded with dark gray phyllite. The metasediments are typically competent and unfoliated, except for zones within the phyllite. The bedrock is mostly unweathered, although some discontinuous weathered zones have been observed. No faulting has been observed in bedrock cores and there are no faults mapped in the vicinity of the site. The bedrock surface beneath the landfill is locally variable; however, the surface generally slopes southeast towards a bedrock trough that exists in the vicinity of the wetlands and unnamed stream at the southwest corner of the site.

The interpreted shallow groundwater phreatic surface and upper bedrock groundwater potentiometric surface contour maps for the JRL site are provided in Appendix B. These maps represent interpretations of the potentiometric surfaces using site data from 2007 and 2008. As expected, the groundwater elevations at the site monitoring wells have declined since then as a result of the cut-off of recharge from precipitation in the area of the landfill liner systems. The 2023 site groundwater level conditions do not result in a significant change to the interpreted groundwater flow directions or the groundwater flow divides at the site, particularly with regard to monitoring groundwater and surface water. Linear trendlines of groundwater elevations later than 2007 were calculated for thirty-nine of the site's fifty current groundwater monitoring locations to evaluate water level changes during the time period ending in October 2023 (see Appendix B for water level and trendline plots). The average slopes of linear trendlines during this period were used to quantify the approximate rates of groundwater elevation changes at site groundwater monitoring locations, which are summarized in Table 2-1.

As shown in Table 2-1, thirty-two of the thirty-nine monitoring wells included in this analysis have downward water level trends for data collected later than 2007. Twenty-two of the monitoring locations included in Table 2-1 are located downgradient of the landfill expansion. Monitoring of groundwater elevation trends at sixteen of these locations shows that the cut-off of recharge from precipitation by the landfill expansion cells' liner systems has resulted in lowering the groundwater elevations at average annual rates ranging from -5.77 feet per year (ft/yr) at MW-504 to -0.11 ft/yr at MW-04-09A. Groundwater elevations have increased at six of the twenty-two landfill expansion monitoring locations downgradient from the landfill expansion, with average annual groundwater elevation change rates ranging from 0.07 ft/yr at OW-611A to 0.80 ft/yr at OW-610A.

The remaining seventeen monitoring locations in Table 2-1 are upgradient or downgradient from all or a portion of Cells 1 through 10 of the JRL. The cut-off of recharge from precipitation by the landfill liner systems has resulted in greater rates of groundwater elevation decline at two of the three upgradient monitoring locations. Upgradient monitoring locations P-206A and MW12-303R have groundwater elevation change rates of -0.55 ft/yr and -0.40 ft/yr, respectively. The groundwater elevation decline at upgradient monitoring location MW-206 has been slower, with a rate of -0.07 ft/yr. Groundwater elevations have declined in thirteen of the fourteen monitoring locations downgradient from all or portions of Cells 1 through 10 of the JRL that were analyzed for groundwater elevation trends for data collected later than 2007. These declines have ranged from rates of -0.15 ft/yr at MW04-102 to under -0.01 ft/yr at MW-401B and MW-402B. The one monitoring location downgradient from all or a portion of Cells 1 through 10 of the JRL with increasing groundwater elevations is MW09-901, which had an increasing rate of 0.18 ft/yr.

Site monitoring wells MW-301, MW-402A, MW-502, MW06-01, OW-603B, OW-606A, OW-606B, and P-04-11B are not included in the analysis summarized in Table 2-1, because the rates of decline cannot be quantified due to either intermittent flowing or dry conditions, but generally show indications of declining

to steady water levels. Monitoring wells MW-501 and MW-503 have been flowing during each monitoring event to date and therefore were also not included in Table 2-1.

Monitoring well MW-301 is located downgradient from the JRL. Groundwater elevation data from MW-301 show slight declines from 2007 through 2012. MW-301 was found to be damaged during the April 2013 monitoring round. It was repaired prior to the July 2013 monitoring round by replacing the upper section of the well, and since that time has had reported average groundwater elevations in the order of 4 feet higher than values prior to the repair. Groundwater elevation data from MW-301 show slight declines from 2013 through 2023.

TABLE 2-1

2023 SUMMARY OF SITE GROUNDWATER ELEVATION TRENDS

Location Designation	Position Relative to Landfill	Date Range for Analysis	Total Groundwater Elevation Change(feet-NGVD)	Average Annual Rate of Groundwater Elevation Change (feet/year)
MW-504	Downgradient (Expansion)	Feb-21 to Oct-23	-15.29	-5.77
MW-08-01	Downgradient (Expansion)	Feb-21 to Oct-23	-15.20	-5.73

OW-610A	Downgradient (Expansion)	Oct-22 to Oct-23	0.80	0.80
MW-507	Downgradient (Expansion)	Apr-18 to Oct-23	1.61	0.29
MW09-901	Downgradient	Dec-09 to Oct-23	2.52	0.18
OW-605A	Downgradient (Expansion)	Apr-18 to Oct-23	3.81	0.69

In addition to the cut-off of precipitation recharge by the landfill liner systems, groundwater elevations at the site are affected by the amount of precipitation that falls on the site. Monthly climate data from the National Oceanic and Atmospheric Administration (NOAA) for Bangor, Maine indicates a 2023 total precipitation of 49.28 inches, which is 6.25 inches above the mean precipitation. As discussed above, groundwater elevations at most monitoring locations continued to lower in 2023 as compared to 2022, when there was a slightly lower total precipitation of 48.38 inches, showing the influence of the cut-off of precipitation recharge by the landfill liner systems on groundwater elevations.

3.0 MONITORING LOCATIONS

Monitoring during 2023 was completed in general accordance with the current EMP for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017). Descriptions of the monitoring locations sampled during 2023 are provided herein.

3.1 Monitoring Locations

Monitoring events were conducted in April, July, and October 2023 at 50 groundwater monitoring wells and piezometers,[4] four pore-water sample locations, four surface water locations, two stormwater locations, fifteen underdrain monitoring locations,[5] five leak detection locations,[6] and one leachate monitoring location. Measurement of field parameters (e.g., temperature and specific conductance) at the underdrain and leak detection monitoring locations that contained water were completed on a monthly basis by NEWSME personnel.

The site monitoring points are summarized in Tables 3-1 and 3-2 and their locations are shown on Figures 1-2 and 1-3. Information on the geologic formation in which each monitoring well is screened, as well as the elevation and distance below ground of each monitoring well screened interval, is listed in Table 3-1.

[4] Three of the site groundwater monitoring wells (DP-4, MW04-105, and MW-204) are only monitored for field parameters and only during the fall monitoring event. MW-204 was found damaged and could not be assessed for field parameters during 2023 but has been repaired and will be monitored during 2024. Fourteen of the site groundwater monitoring wells (OW-06-03, OW-601A, OW-601B, OW-602A, OW-603B, OW-604A, OW-605A, OW-606A, OW-606B, OW-607B, OW-608A, OW-608B, OW-609B, OW-610A, OW-611A, P-04-07A, P-04-07B, P-04-11A, and P-04-11B) are monitored for detection monitoring parameters only during the summer monitoring event and are monitored for field parameters only during the spring and fall monitoring events. Monitoring well OW-06-03 was dry in July 2023 and monitoring well OW-603B had insufficient water for sampling in July 2023.

[5] Samples were obtained from three underdrain monitoring locations (LF-UD-5 and 6, LF-UD-12+13+14, and LP-UD-2) during one or more of the 2023 sampling events. The remaining ten underdrain monitoring locations were not sampled during 2023 due to dry conditions (LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD 5 and 6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LF-UD-12+13+14, LP-UD-1, and LP-UD-2). No composite samples were required to be taken at Manhole #5 (LF-COMP) and Manhole #7 (LP-COMP) in 2023.

[6] Leak detection monitoring locations LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 were sampled for field parameters and the detection monitoring parameters in July 2023 and for field parameters monthly. Monthly monitoring of field parameters began at LF-LD-15 in July 2023. LF-LD-15 will begin to be monitored for the detection monitoring parameters during 2024.

TABLE 3-1

2023 GROUNDWATER MONITORING LOCATIONS

Location Designation	Position Relative to Landfill	Screen Depth Interval (feet below ground surface)	Ground Surface Elevation (feet-NGVD)	Screen Interval Elevation (feet-NGVD)	Geologic Formation Screened
MW-204	Downgradient	13.8 – 18.8	164.0	150.2 – 145.2	Overburden
MW-206	Upgradient	15.0 – 20.0	200.9	185.9 – 180.9	Overburden
P-206A	Upgradient	85.5 – 90.5	201.5	116.0 – 111.0	Bedrock

LP-UD-2	Detention Pond 1A underdrain north end at MH #7
LF-COMP	Composite sample of LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7 when water level in manhole covers the inlet pipes at MH #5
LP-COMP	Composite sample of LP-UD-1 and LP-UD-2 when water level in manhole covers both of the inlet pipes at MH #7
LT-C4LR	Leachate – On-site leachate storage tank

The sampling frequencies and monitoring parameters for each monitoring location are listed in the site's EMP. Monitoring parameters are discussed in Section 4.0. During 2023, SME also performed baseline water quality monitoring at the four remaining expansion monitoring wells MW-508, OW-610A, P-04-07A, and P-04-07B. These baseline monitoring results were submitted to MEDEP in 2023.

3.2 Groundwater Locations

Groundwater monitoring wells MW-206, P-206A, and MW12-303R are positioned upgradient of the landfill.

Groundwater monitoring wells DP-4, MW04-102, MW04-105, MW04-109R, MW-204, MW-223A, MW-223B, MW-227, MW-301, MW-401A, MW-401B, MW-402A, MW-402B, MW09-901, P-04-02R, and P-04-04 are positioned downgradient of all or part of Cells 1 through 10 of the landfill.

Groundwater monitoring wells MW-04-09A, MW-04-09B, MW-08-01, MW-501, MW-502, MW-503, MW-504, MW-505, MW-506, MW-507, MW-508, OW-06-01, OW-06-03, OW-601A, OW-601B, OW-602A, OW-603B, OW-604A, OW-605A, OW-606A, OW-606B, OW-607B, OW-608A, OW-608B, OW-609B, OW-610A, OW-611A, P-04-07A, P-04-07B, P-04-11A, and P-04-11B are positioned downgradient of the landfill expansion.

3.3 Surface Water and Stormwater Locations

Surface water monitoring locations SW-1, SW-2, and SW-3 are located west of the landfill in a southwesterly unnamed tributary to Pushaw Stream. SW-1 and SW-3 are located downstream of the landfill, while SW-2 is located upstream of the landfill. Surface water monitoring location SW23-4 is located northeast of landfill in a northerly unnamed tributary to Pushaw Stream. Stormwater sample monitoring locations SW-DP1 and SW-DP6 are located at the discharge locations of Detention Pond 1 and Detention Pond 6, respectively.

3.4 Pore-Water Locations

Stream-based pore-water sample locations PWS10-1, PWS10-2, and PWS10-3 are located downgradient of the landfill along the southwesterly unnamed tributary to Pushaw Stream and represent water in the overburden adjacent to the stream. Stream-based pore-water sample location PWS-4 is located downgradient of the landfill expansion along a northerly unnamed tributary to Pushaw Stream and represents water in the overburden adjacent to the stream.

3.5 Leachate Sample Location

During the 2023 sampling events, leachate samples were obtained from the on-site leachate storage tank (i.e., LT-C4LR). The sampling location at the leachate storage tank, LT-C4LR, is shown on Figure 1-2.

3.6 Underdrain Monitoring

The sample locations where underdrain samples were obtained in 2023 are shown on Figures 1-2 and 1-3 and a diagram of the underdrain collection system is included on Figure 3-1. By design, the sampling of the landfill underdrain system provides a means to monitor for landfill cell leakage as the underdrains underlie the landfill liner system. Manhole MH #5, located northeast of Detention Pond 1A, is the sample location which receives groundwater entering the underdrains beneath Cells 1, 2, 3A, 3B, 4, and 7. The

sampling location for the underdrain for Cell 6 (LF-UD-6) is from a stilling well in the underdrain line. The base grades for Cells 5 and 6 were designed such that the Cell 5 underdrain would also accommodate flow from the Cell 6 underdrain. The combined flow from the Cells 5 and 6 underdrains then drains to a 6-inch-diameter pipe outfall located on the southern perimeter of the landfill, which is sampled as a composite sample (LF-UD-5 and 6).

The underdrain for Cell 8 was constructed in 2012 at a discrete location shown on Figure 3-1. LF-UD-8 was added to the monitoring program during the April 2013 sampling event as the underdrain monitoring location for Cell 8. The underdrain for Cell 9, LF-UD-9, was constructed in 2015 and was added to the monitoring program during the April 2016 sampling event. With the construction of Cell 10 in 2017, the underdrain piping and sample collection location of the underdrain for LF-UD-9, which was located in a temporary underdrain manhole adjacent to Cell 9, was extended to the south outside of the Cell 10 perimeter berm. The underdrain for Cell 10, LF-UD-10, was constructed in 2017 outside of the southern perimeter berm of Cell 10, and was added to the monitoring program during the October 2017 sampling event.

The Cell 12 underdrain, LF-UD-12, was monitored in spring of 2021. Samples for the underdrains for Cells 12 through 14 are now collected as a combined sample at monitoring location LF-UD-12+13+14, which was first monitored in fall 2022. Data from LF-UD-12 has been combined with data from LF-UD-12+13+14.

Manhole location MH #7, which is located southwest of Detention Pond 1A, is the sample location for LP-UD-1 and LP-UD-2, which monitors groundwater entering the southern and northern underdrains, respectively, of Detention Pond 1A.

Underdrain samples were obtained by SME as part of routine monitoring and analyzed for the detection monitoring parameters. Samples were also obtained monthly by NEWSME for field parameters. The underdrain sample locations LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5 and 6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LP-UD-1, and LP-UD-2 were sampled during 2023, unless those locations were dry or their sample pipe inverts were submerged.

Historically, during times when LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, and LF-UD-7 were not able to be sampled separately due to pipe invert submergence, LF-COMP has been obtained from the manhole MH #5. This sample provides a composite sample of the subject underdrain locations. Sample pipe submergence did not occur during the three 2023 detection monitoring events. LF-COMP samples were obtained from manhole MH #5 and analyzed for field parameters during each of the twelve 2023 monthly monitoring events regardless of the level of the liquid level in the manhole.

Composite LP-COMP samples have never been obtained during the routine monitoring events in 2023 because pipe invert submergence did not occur at individual sample locations LP-UD-1 and LP-UD-2. LP-COMP samples were obtained and analyzed for field parameters during each of the twelve 2023 monthly monitoring events regardless of the level of the liquid level in the manhole.

3.7 Leak Detection Monitoring

Detection monitoring began in 2021 at landfill leak detection sampling locations LF-LD-11 and LF-LD-12 for the Cells 11 and 12 leak detection systems, respectively. Detection monitoring began in 2022 at landfill leak detection sampling location LF-LD-13 for the Cell 13 leak detection system and in 2023 for landfill leak detection sampling location LF-LD-14 for the Cell 14 leak detection system. Detection monitoring for landfill leak detection sampling location LF-LD-15 for the Cell 15 leak detection system will begin in 2024. Monitoring locations LF-LD-11, LF-LD-12, LF-LD-13, LF-LD-14, and LF-LD-15 are shown on Figure 3-1.

3.8 Annual Monitoring Well Specific Conductance Measurements

Specific conductance measurements were measured in 2023 from an expanded list of monitoring wells surrounding the existing landfill operations at JRL during the October monitoring event based on the MEDEP's request in 2008. Locations measured annually for specific conductance are listed in Table 3-3 and shown on Figure 3-2. The results of the 2023 and historical fall specific conductance measurements are included in Appendix C.

TABLE 3-3

Notes:
1. MW-204 was found damaged in October 2023 and was not monitored for specific conductance. MW-204 has been repaired and will be monitored in 2024.
2. Similar to most other years, P-209C was dry in October 2023 and specific conductance was not measured at this location.
3. P-220A and P-220B have not been monitored since 2021 because the area was flooded due to a beaver dam.

3.9 Water Quality Landfill Gas Monitoring Program

Concurrent with the routine water quality monitoring events in 2023, site monitoring wells, underdrain locations, leachate manholes, a leak detection manhole, and JRL site property boundaries were monitored for the presence of landfill-related gases using a hand-held gas meter. Figures 1-2 and 1-3 show the gas monitoring locations associated with the landfill's water quality monitoring program. The results of the 2023 and historical landfill gas monitoring are discussed in Section 9.0.

4.0 MONITORING PARAMETERS

4.1 Detection Monitoring Program

Table 3-3 shows the monitoring locations where detection monitoring was performed in 2023. Sampling during 2023 was completed in general accordance with the current EMP for the JRL (revised April 2016) and the EMP for the JRL expansion (revised June 2017). The detection monitoring parameters are listed in Table 4-1. In instances where Table 3-3 shows a monitoring location is monitored for field parameters, the only measurements taken are groundwater elevation, specific conductance, dissolved oxygen, pH, temperature, turbidity, and monitoring well pumping rate or surface water flow rate.

Analysis for volatile organic compounds (VOCs) was included during the April monitoring event for multiple locations (LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5 and 6, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LF-UD-12+13+14, LP-UD-1, LP-UD-2, and MW-401B), provided that there was sufficient water available to sample at these locations. The leachate samples (LT-C4LR) were analyzed for the same VOCs list during the April, July, and October 2023 monitoring events. LT-C4LR was also analyzed for the parameters listed in Appendix A, Column 3 of the Chapter 405 MEDEP Solid Waste Regulations during the April 2023 monitoring event. The Cell 15 baseline monitoring program monitoring wells were also each monitored for VOCs during the baseline monitoring events in 2023.

A supplement to the 2023 monitoring program included sampling and analysis for dissolved methane at monitoring well MW-223B in April 2023 and pore-water sampling locations PWS10-1, PWS10-2, and PWS10-3 in April, July, and October 2023. Dissolved methane is also included in the EMP for the JRL expansion. The results of the 2023 dissolved methane monitoring are discussed in Section 8.0.

TABLE 4-1

2023 DETECTION MONITORING ANALYTICAL PROGRAM

Water Quality Parameter	Method	PQL[1] (mg/l)[2]
Total Dissolved Solids	SM 2540C	10
Total Suspended Solids	SM 2540D	2.5
Total Organic Carbon (TOC)	SW9060A	2.0
BOD5[3]	SM 5210B	2
Arsenic (As)	SW6010C/3010A	0.005
Calcium (Ca)	SW6010C/3010A	0.3
Iron (Fe)	SW6010C/3010A	0.05
Magnesium (Mg)	SW6010C/3010A	0.3
Manganese (Mn)	SW6010C/3010A	0.05
Potassium (K)	SW6010C/3010A	0.3
Sodium (Na)	SW6010C/3010A	0.3
Chloride (Cl^-)	SWE300/9056A	1.0
Copper (Cu)[9]	SW6010C/3010A	0.003
Sulfate (SO_4)	SWE300/9056A	2.0
Sulfide[4,9]	HACH 8131	0.1[1]
Volatile Organic Compounds (VOCs)[5]	U.S.EPA 8260C	0.005-0.02
Ammonia (NH3-N)[9]	SM 4500 NH3 B/ SM4500 NH3 C	0.5
Total Alkalinity[9]	SM 2320B	1.5
Nitrate + Nitrite	EPA 353.2	0.05
Total Kjeldahl Nitrogen (TKN)[7]	SM 4500 NorC/NH3D-11	0.2[1]
Total Phosphorous[8]	U.S.EPA 365.3	0.04
Boron[9]	SW6010C/3010A	0.05
Bromide	SW9056A	0.1
Methane[9,10]	EPA 8015B(MOD RSK-175)	0.02
FIELD PARAMETERS		
Groundwater Elevation	Field Measurement	NA
Specific Conductance	Field Measurement	NA
Dissolved Oxygen	Field Measurement	NA
pH	Field Measurement	NA
Temperature	Field Measurement	NA
Turbidity	Field Measurement (APHA 2130)	NA
Eh	Field Measurement	NA
Monitoring Well Pumping Rate	Field Measurement	NA
Water Flow Rate[11]	Field Measurement	NA
Field Observations	Field Observations	NA

Notes:

1 Practical Quantitation Limits (PQLs) have been defined by U.S.EPA as up to 10 times the method or instrument detection limit and therefore may vary between laboratories.

2 Abbreviations: mg/l = milligrams per liter; NA = Not Applicable.

3 Surface water locations only.

4 Sulfide is analyzed on the spring leachate sample.

5 VOCs are the 47 organic constituents listed in Appendix I of 40 CFR Part 258. PQLs for VOCs are the lab method detection limits which are reported as micrograms per liter (µg/l). Also, diethyl ether and tetrahydrofuran will be included in the reported compounds. After two rounds of Characterization monitoring these compounds will only be sampled in the landfill leachate on a routine basis.

6 During spring sample event, MW-401B, LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-5, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, LF-UD-12+13+14, LP-UD-1, and LP-UD-2 are analyzed for VOC compounds. Leachate is analyzed for VOC compounds during all three monitoring events.

7 Monitoring wells and leachate only.

8 Pore-water, surface waters, stormwater, and underdrain only.

9 Cells 11 through 17 monitoring wells. Cells 11 through 17 Leak Detection and Underdrain locations (summer only).

10 Porewater, P-04-07A&B, MW-04-09A&B, P-04-11A&B, MW-206, P-206A, and MW-223B.

11 Surface water, leak detection, and underdrain samples only.

Method Reference: The analytical methods selected are presented in Test Methods for Evaluating Solid Waste, OSWER, SW-846, Third Edition, as revised; Methods for Chemical Analysis of Water and Wastes, EMSL, EPA-600/4-79-020, revised March 1983; and Standard Methods for the Examination of Water and Wastewater, APHA, 22nd Edition, 2012. Equivalent and appropriate analytical methods may be substituted with Juniper Ridge Landfill approval, e.g., manual for automated and vice versa.

5.0 SAMPLING TECHNIQUES

5.1 Monitoring Wells

Groundwater samples from monitoring wells and piezometers are obtained utilizing the low-flow sample collection techniques in general accordance with the EMP for the JRL. The low-flow sampling program includes dedication of 1/8-inch-diameter (I.D.) polyethylene tubing in each well. The tubing is secured at the top of the well such that the inlet of the tubing is placed approximately at the middle of the screen zone in each well. Prior to sampling, the static water level is measured in each well. A peristaltic pump with an adjustable flow rate is used to purge and sample monitoring wells with relatively shallow water tables. Monitoring wells with water tables greater than 28 feet below ground surface (bgs) are sampled with dedicated submersible pumps rather than a peristaltic pump due to the depth of the groundwater.

The low-flow sampling procedure at the JRL consists of purging the monitoring wells at approximately 100 to 200 milliliters per minute. While the wells are being purged, water levels and field parameter measurements of specific conductance, temperature, pH, Eh, dissolved oxygen, and turbidity are taken through a flow-through cell at regular intervals. Field parameters and water level measurements are monitored to determine if parameter stabilization has occurred as outlined in the EMP. Once stabilization of the field parameters has occurred, in particular for water level and turbidity, a sample is obtained for chemical analysis. Several of the wells have very low recharge rates and therefore do not stabilize even under these low purge rates. For these wells, a sample is obtained after purging the liquid present in the sampling tube and pump.

5.2 Surface Water, Stormwater, Underdrain, Leak Detection, and Leachate Sampling Locations

Grab samples are obtained at the surface water, stormwater, underdrain, leak detection, and leachate sampling locations, which is consistent with historical sampling methods and in accordance with the EMP. These samples are not filtered prior to analysis.

5.3 Pore-Water Sampling Locations

The pore-water samples are obtained in the following manner:

1. The pore-water sampling apparatus (i.e., pore-water sampler) is decontaminated with Alconox® and deionized water solution followed by several deionized water rinses;
2. The area to be sampled is entered from an area downstream from the sample point. Caution is used not to disrupt the area where the pore-water sampler will be used;
3. The pore-water sampler is gently pushed approximately two feet into the soil surface in the sampling location area specified in the EMP. The inner rod remains inside of the pore-water

sampler as it is pushed into the soil surface in order to maintain the integrity of the pore-water sample;

4. Once the pore-water sampler is advanced approximately two feet into the soil surface, the inner rod is removed and a new, clean piece of polyethylene tubing is attached to the top of the pore-water sampler using a new, clean silicone tube coupling;
5. Water is pumped from the pore-water sampler at a rate of approximately 100 to 200 milliliters per minute with a peristaltic pump;
6. Field parameters are monitored at a regular interval until stabilization criteria are met, or until the pore-water sampler runs out of water. If the pore-water sampler runs out of water, it is allowed to recharge and samples are then obtained for laboratory analyses; and
7. After sampling is complete, the pore-water sampler is removed from the soils and a labeled grade stake is installed at the sampling location that clearly identifies the location for future sample collection from the same general location.

5.4 Water Quality Landfill Gas Monitoring

Gas monitoring at the monitoring wells, underdrain locations/manholes, leak detection manhole, and JRL site property boundaries is done using a hand-held gas meter. Measurement of headspace gas in the monitoring wells is accomplished by placing the probe tip into the upper few inches of the well casing immediately after the well cap is removed. Gas measurements at underdrain and leak detection manhole locations are measured by placing the probe at the manhole opening where samples are obtained. The meter is calibrated daily before use. Methane-equivalent, carbon dioxide, and oxygen are reported as percent by volume. Hydrogen sulfide is reported in parts per million by volume.

5.5 Sample Handling and Chain-of-Custody

After obtaining the water quality samples in 2023, the samples were preserved on ice in coolers and shipped by SME to Maine Environmental Laboratory (MEL) of Yarmouth, Maine for analyses. Eastern Analytical, Inc. of Concord, New Hampshire, Katahdin Analytical Services of Scarborough, Maine, and Alpha Analytical of Westborough, Massachusetts performed some of the analyses under contract to MEL. Chain-of-custody sheets prepared by the sampling personnel accompanied the samples and contain the signatures documenting the transfer of the water quality samples from the field sampler to the receiving laboratory.

6.0 DATA VALIDATION AND QUALITY ASSURANCE (QA)/QUALITY CONTROL (QC)

QA/QC activities associated with sampling include the utilization of standardized collection procedures and sample data records, calibration of field instruments, and the use of chain-of-custody procedures. SME followed the EMP procedures to ensure that both the field instruments and protocols employed generate data that are reliable and provide valid analytical results. Instruments were calibrated, analyses were conducted to determine potential matrix interference as necessary, precision and accuracy were checked, and hold-times were verified. Analytical QA/QC involves the use of approved analytical protocols by a qualified laboratory. Water quality samples that were analyzed outside of the required hold-times are identified in Appendix D.

Data validation and laboratory quality control procedures were followed and documented as described in the MEDEP Solid Waste Management Rules, Chapter 405. During 2023 monitoring events, duplicate water quality samples were obtained from several monitoring locations, as discussed in water quality data submittals for each round. Reports on Relative Percent Difference (RPD), calculated ratios of total dissolved solids to specific conductance, and values falling outside of historical ranges for each monitoring event were presented in each of the three data transmittals provided in 2023.

7.0 DATA ANALYSIS

Appendix D contains tables of historical water quality data collected over the past ten years including 2023 for the sampling locations and parameters identified in this report. Water quality data for the site have been quantitatively evaluated using the methods described below and qualitatively evaluated based on the knowledge of the site hydrogeologic conditions developed from the extensive site investigations and the status of site development and operations. Detailed discussion and evaluations of the water quality from sampling locations are presented in Section 8.0. Conclusions about site water quality are based on a combination of the quantitative and qualitative methods used to evaluate the water quality data.

7.1 Concentrations above MCL, LHA, DWA, MFCCC

Parameters measured at the site groundwater monitoring wells and pore-water sample locations that were above their respective Maine and U.S.EPA drinking water quality standards during 2023 are identified in detail in Sections 8.3 and 8.4. The Maine Center for Disease Control (MECDC) uses the U.S.EPA drinking water standards and health advisory levels for contaminants found in well water in Maine.[7] The health-related U.S.EPA drinking water standards and health advisory levels include:

- Maximum Contaminant Levels (MCLs);
- Life-time Health Advisory (LHA) Levels; and
- Health-Based Drinking Water Advisories (DWAs).

Parameters measured at the site surface water and stormwater monitoring locations that were above their Maine Freshwater Criterion Continuous Concentrations (MFCCCs) during 2023 are identified in detail in Section 8.4.

7.2 Key Indicator Parameters for Comparison to JRL Leachate

For each of the site monitoring locations, specific conductance, chloride, and arsenic concentrations are summarized as key indicator parameters for comparison to JRL leachate concentrations. Generally, at a given water quality monitoring location, if landfill leachate were present, there would be a notable, significant, increase in specific conductance values and chloride and arsenic concentrations (in conjunction with changes in other parameter concentrations) due to their presence at high concentrations in the JRL leachate. In 2023, the annual maximum value of specific conductance in JRL leachate (i.e., monitoring location LT-C4LR) was 20,000 µmhos/cm in April 2023. The annual maximum concentrations

[7] United States Environmental Protection Agency, 2018. 2018 Edition of the Drinking Water Standards and Health Advisory Tables.

of chloride and arsenic at monitoring location LT-C4LR were 5,000 mg/L (April and July 2023) and 0.43 mg/L (July 2023), respectively.

Specific conductance gives an indication of the total dissolved constituents at each monitoring location. Chloride is useful in assessing the site water quality in comparison to JRL leachate due to its conservative nature in terms of adsorption, precipitation, and degradation in the groundwater environment. It is important to note that increases in chloride may also be due to runoff and recharge from salting or dust control of nearby roadways. Therefore, increases in chloride levels also need to be reviewed relative to site conditions.

Currently, there are limited occurrences of arsenic MCL (0.01 mg/L) exceedances in site groundwater that are attributed to reducing conditions associated with decreasing groundwater recharge from site development. These reducing conditions are interpreted to favor reductive dissolution of arsenic and iron hydroxides that are present naturally in the soils and bedrock, which results in the release and mobility of dissolved arsenic in the groundwater. The highest arsenic concentration at the JRL water quality monitoring locations in 2023 (0.020 mg/L at MW-402B in April 2023) is more than an order-of-magnitude lower than in the JRL leachate in 2023. The historical maximum arsenic concentration in the JRL leachate is 0.6 mg/L (July 2017). If observed, occurrence of arsenic concentration increases in the JRL water quality monitoring locations, accompanied by increases in specific conductance values and chloride concentrations, may be a reliable indicator of landfill impacts resulting from the presence of JRL leachate.

Bromide was added to the monitoring program during 2013. Section 8.1 includes an evaluation of the chloride to bromide ratios for the JRL leachate during 2023 and how they compare to chloride to bromide ratios for site monitoring locations during 2023.

7.3 Data Plots and Data Summary Sheets

Water quality data for each monitoring location are summarized in the data summary sheets contained in Appendix E. The summary sheet prepared for each sampling location contains a map and description of the monitoring point, a 2023 water quality data summary, and a statistical summary of the historical data prior to 2023. Parameter concentrations that exceeded the last twenty years of historical minimum and maximum concentration values in 2023 at site monitoring locations are identified on the individual water quality summary sheets contained in Appendix E.

Also included in Appendix E are data plots of select monitoring parameter data for each of the sampling locations. The data plots graphically provide a useful way to visually identify long-term and short-term trends in the water quality data.

7.4 Mann-Kendall Trend Analyses

Mann-Kendall trend analyses were run for the JRL water quality data to screen for potential statistically significant changes in water quality parameter concentrations over time. The Mann-Kendall analysis was chosen because it is nonparametric and is robust to outliers, missing data, and non-detects. Time-series plots of water quality parameter concentrations often contain multiple trends over time due to various factors. In order to evaluate current trends for this annual report, the Mann-Kendall trends were analyzed over a five-year time period at a 95 percent confidence level.

The Mann-Kendall results for groundwater, surface water, stormwater, leachate, leak detection, and underdrain locations are provided in Appendix F and are discussed by location in Section 8.0.

Although rapid increases in concentrations of multiple parameters at a monitoring location may reflect site operational impacts such as spillage of leachate or landfill liner leakage, changes in multiple parameter values at a given monitoring location can also result from changes in groundwater conditions unrelated to the landfill leachate. As an example, decreases in natural precipitation recharge to the groundwater will change redox, alkalinity, and pH conditions, which results in the release of various constituents such as iron, manganese, and arsenic from soils and bedrock into the groundwater. Nearly all chemical constituents are subject to changes in concentrations resulting from interactions between soil, rock, and groundwater.

Increases in multiple (i.e., four or more) parameters, especially key indicator parameters, are noted in our evaluation of the water quality in the site monitoring locations. At locations where this criterion is met, further assessment of water quality data and site conditions is completed to ascertain the potential causes for the change in water quality.

The trend analyses are used as a screening tool to review the water quality and must be viewed in conjunction with other factors such as the specific parameters exhibiting trends and the parameter concentrations detected at the monitoring locations (i.e., a specific parameter could have an increasing trend, but remain within a range consistent with upgradient concentrations). The results of the trend screening analyses are compared visually with the time-series plots (data plots) described above to aid in assessing the actual significance of a statistical trend.

7.5 Stiff and Piper Diagram Construction

Stiff and Piper Diagrams were constructed for multiple monitoring locations to assist in the evaluation of water quality at these locations in 2023. These diagrams are graphical representations of select parameters that display the major ion composition of a water quality sample. They were used at several of the monitoring locations to compare the ionic composition of the water quality samples to other

sample results such as upgradient locations and/or the landfill leachate to assess potential sources of water at the wells. This can be a valuable tool to compare water quality between various locations since it can be used to “fingerprint” ionic ratios, independent of concentration. See Appendix G and Appendix H for Stiff and Piper diagrams.

8.0 WATER QUALITY EVALUATION

The 2023 water quality data for the JRL is generally consistent with the historical data for the site. The 2023 water quality data from monitoring locations at the JRL are consistent with their setting among the construction and operational activities of the landfill. Site groundwater, surface water, and underdrain quality data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. Water quality changes have been observed at the JRL, both upgradient and downgradient from the landfill. These trends are largely attributable to landfill operations and changes in redox conditions, which occur as expected around the landfill due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.

Arsenic is the only parameter analyzed in groundwater monitoring wells that was detected above an MCL in 2023. During 2023, arsenic concentrations were generally low at the site-wide monitoring locations. Of the 45 wells sampled in 2023, only six wells had arsenic concentrations detected above the MCL (0.01 mg/L). The maximum arsenic concentration detected at site-wide monitoring locations was 0.020 mg/L at MW-402B in April 2023. There were no arsenic concentrations detected above the MCL at pore-water sampling locations PWS10-1, PWS10-2, and PWS10-3 in 2023. There were no arsenic MFCCC exceedances during 2023 at surface water monitoring locations SW-1, SW-2, and SW-3. Arsenic was detected slightly above its MCL at pore-water sampling location PWS-4 (0.011 mg/L in April 2023) but was not detected above the laboratory reporting limit of 0.005 mg/L during monitoring at that location in March, June, July, and October 2023. SW23-4 had an arsenic concentration of 0.01 mg/L in July 2023, but was not detected in March, April, June, or October of 2023.

Low arsenic concentrations in 2023 are a continuation of a trend observed since 2017 of generally lower site-wide concentrations of arsenic compared to concentrations prior to 2017. In contrast to 2023 arsenic data, all routine monitoring wells (19 at the time) and two of the three pore-water sampling locations had arsenic MCL exceedances during one or more sampling event in 2016.

The presence of arsenic at JRL monitoring locations in 2023, while limited, is attributed to reducing conditions associated with decreasing groundwater recharge from site development. These reducing conditions are interpreted to favor reductive dissolution of arsenic and iron hydroxides that are present naturally in the soils and bedrock, which results in the release and mobility of dissolved arsenic in the groundwater.

Observations relative to the site water quality data for 2023, in terms of historical and regulatory comparisons and site setting, are discussed below for: leachate (Section 8.1); underdrain (Section 8.2); groundwater (Section 8.3); and surface water, stormwater, and pore-water (Section 8.4) monitoring

locations. Water quality parameter data not specifically discussed in this report are considered to be generally consistent with the previously obtained water quality data for the JRL.

8.1 Leachate

The landfill leachate is sampled and analyzed as part of the ongoing water quality monitoring program. Leachate samples were obtained from the on-site leachate storage tank (i.e., LT-C4LR) during 2023. Leachate sampling location LT-C4LR replaced the former leachate sampling location in July 2013 in order to obtain leachate samples that are representative of leachate from all of the landfill cells. The leachate at LT-C4LR was sampled for the parameters in the detection monitoring analytical program (see Table 4-1) in July 2023 and October 2023 and was sampled for the parameters listed in Appendix A, Column 3 of the Chapter 405 MEDEP Solid Waste Rules in April 2023. Leachate samples associated with compliance monitoring for off-site wastewater treatment are also obtained at the leachate storage tank when transport tanker trucks are being loaded. During 2023, approximately 26.5 million gallons of leachate were loaded into tanker trucks and transported from JRL for off-site treatment.

2023 Leachate Parameters that Fall Outside of Historical Range

Leachate parameter values during 2023 and historically are generally characterized by high concentrations. There were multiple parameters that were detected outside of their respective historical ranges during 2023 for LT-C4LR. The parameters with new historical maximum or minimum values at LT-C4LR in 2023 are summarized in Table 8-1. Laboratory reporting limits have decreased in the past few years. Typically VOC reporting limits were 10 to 40 μg/L and are currently 0.5 to 1 μg/L, which correlates to seeing historic highs in the data, at levels which could not have been measured previously.

TABLE 8-1

SUMMARY OF LT-C4LR PARAMETERS WITH NEW HISTORICAL MINIMUM OR MAXIMUM VALUES IN 2023

Parameter and Units	Date	New Historical Minimum Value	New Historical Maximum Value
Vinyl Chloride (µg/L)	4/18/2023	-	1.5 (0.75)
Benzene (µg/L)	4/18/2023	-	6.6 (5.6)
	7/11/2023	-	6.2 (5.6)
Styrene (µg/L)	10/2/2023	-	2.0 (1.4)
o-Xylene (µg/L)	4/18/2023	-	8.5 (8.0)
	7/11/2023	-	11 (8.0)
	10/2/2023	-	9.9 (8.0)
m,p-Xylene (µg/L)	4/18/2023	-	16 (13)
	7/11/2023	-	19 (13)
	10/2/2023	-	20 (13)
cis-1,2-Dichloroethene (µg/L)	7/11/2023	-	3.2 (2.5)
	10/2/2023	-	3.1 (2.5)
Diethyl Ether (µg/L)	10/2/2023	-	35 (16)
Cyanide (µg/L)	4/18/2023	-	810 (430)
Chromium (mg/L)	4/18/2023	-	0.29 (0.21)
Iron (mg/L)	7/11/2023	2.9 (3.1)	-
Dissolved oxygen (mg/L)	10/2/2023	0.1 (0.2)	-

Notes:
Previous historical maximum and minimum values are shown in parentheses.
U = not detected above indicated laboratory reporting limit

2023 Leachate Key Indicator Parameters

The specific conductance values at LT-C4LR in 2023 ranged from 17,673 µmhos/cm in October 2023 to 20,000 µmhos/cm in April 2023. Chloride concentrations at LT-C4LR in 2023 ranged from 3,900 mg/L in October 2023 to 5,000 mg/L in April and July 2023. Arsenic concentrations at LT-C4LR in 2023 ranged from 0.25 mg/L in October 2023 to 0.43 mg/L in July 2023. The 2023 data from the leachate monitoring location is included in Appendix D.

2023 Leachate Mann-Kendall Trends

The results for the five-year Mann-Kendall trends at LT-C4LR are provided in Appendix F. There are six parameters (ammonia, arsenic, bicarbonate, chromium, nickel, and total Kjeldahl nitrogen) with statistically significant increasing trends and six parameters (calcium, chloride, dissolved oxygen, magnesium, sulfate, and total suspended solids) with statistically significant decreasing trends for LT-C4LR over the past five years.

2023 Leachate VOCs, SVOCs, Herbicides, Pesticides, and PCBs

Leachate was monitored for VOCs, SVOCs, herbicides, pesticides, and PCBs in April 2023 at LT-C4LR and for VOCs during the July 2023 and October 2023 monitoring events at LT-C4LR. Appendix D includes the monitoring results at LT-C4LR for 2023. The results of VOC, SVOC, herbicide, pesticide, and PCB parameters at LT-C4LR detected during 2023 at levels above their respective laboratory reporting limits are summarized below:

- Acetone (1,300 µg/L in April 2023, 430 µg/L in July 2023, and 930 µg/L in October 2023);
- Vinyl chloride (1.5 µg/L in April 2023);
- 1,1-Dichloroethane (1.0 µg/L in October 2023);
- 1,2-Dichloroethane (2.0 µg/L in April 2023, 2.4 µg/L in July 2023, and 5.3 µg/L in October 2023);
- cis-1,2-Dichloroethene (2.5 µg/L in April 2023, 3.2 µg/L in July 2023, and 3.1 µg/L in October 2023);
- trans-1,2-Dichloroethene (5.3 µg/L in October 2023)
- Tetrachloroethene (1.3 µg/L in October 2023);
- Methyl ethyl ketone (900 µg/L in April 2023, 300 µg/L in July 2023, and 780 µg/L in October 2023);
- Benzene (6.6 µg/L in April 2023, 6.2 µg/L in July 2023, and 5.5 µg/L in October 2023);
- 4-Methyl-2-pentanone (46 µg/L in April 2023, 27 µg/L 2023 in July 2023, and 33 µg/L in October 2023);
- Toluene (33 µg/L in April 2023, 30 µg/L in July 2023, and 48 µg/L in October 2023);
- Ethylbenzene (12 µg/L in April 2023, 13 µg/L in July 2023, and 13 µg/L in October 2023);
- m,p-Xylene (16 µg/L in April 2023, 19 µg/L in July 2023, and 20 µg/L in October 2023);
- o-Xylene (8.5 µg/L in April 2023, 11 µg/L in July 2023, and 9.9 µg/L in October 2023);
- Tetrahydrofuran (480 µg/L in April 2023, 450 µg/L in July 2023, and 560 µg/L in October 2023);
- 1,4-Dichlorobenzene (1.3 µg/L in April 2023, 1.3 µg/L in July 2023, and 1.3 µg/L in October 2023);
- Diethyl ether (16 µg/L in April 2023, 12 µg/L in July 2023, and 35 µg/L in October 2023);
- Methylene chloride (30 µg/L in October 2023);
- Styrene (1.2 µg/L in July 2023 and 2.0 µg/L in October 2023);
- Acetophenone (12 µg/L in April 2023);
- Naphthalene (16 µg/L in April 2023);

- Phenol (84 µg/L in April 2023); and
- 3&4-Methylphenol (210 µg/L in April 2023).

During 2023, multiple rounds of baseline monitoring, including for VOCs, were conducted at monitoring locations MW-508 (March, April, and June), OW-610A (January, April, and June), P-04-07A (March, April, and June), P-04-07B (March, April, and June), PWS-4 (March, April, June, July, and October), and SW23-4 (March, April, June, and July). Tetrahydrofuran was detected at P-04-07A at a concentration of 16 µg/L during the March 2023 monitoring event. No other VOCs were detected at any of the wells during any monitoring round.

2023 Leachate Bromide Concentrations Compared to Groundwater, Underdrain, Leak Detection, Pore-Water, Surface Water, and Stormwater Bromide Concentrations

Bromide was present in the leachate (LT-C4LR) samples obtained during 2023 at concentrations ranging from 53 mg/L in April 2023 to 71 mg/L in April 2023, which are within the historical range for bromide at LT-C4LR. The chloride to bromide ratio for the leachate and site monitoring locations is being evaluated for its potential as a useful screening tool for assessing possible leachate influence in water samples obtained from site monitoring locations. The chloride to bromide ratios for the leachate during 2023 were approximately 70 to 1 in April 2023, 79 to 1 in July 2023, and 74 to 1 in October 2023.

While the ratio of chloride to bromide can be used to differentiate a variety of bromide sources,[8] the bromide concentrations in the JRL water quality sampling locations in 2023 were either non-detect or at low values. In 2023, bromide analyses were conducted on a total of 157 samples taken from 62 monitoring locations including groundwater monitoring wells, underdrain monitoring locations, leak detection monitoring locations, pore-water monitoring locations, surface water monitoring locations, and stormwater monitoring locations. 115 of the samples were non-detect at a laboratory reporting limit of 0.10 mg/L.

There were 42 bromide measurements at 24 monitoring locations during 2023 among the groundwater, underdrain, leak detection, pore-water, and surface water monitoring locations with detections above the laboratory reporting limit. Among the 42 bromide detections during 2023, the concentrations ranged from 0.10 mg/L to 0.26 mg/L with a mean concentration of 0.15 mg/L.
Bromide detections at monitoring locations during 2023 were within their respective historical ranges with the following exceptions:

[8] Panno, S.V., Hackley, K.C., Hwang, H.H., Greenberg, S.E., Krapac, I.G., Landsbergger, S., and O'Kelly, D.J., 2006, Characterization and identification of Na-Cl sources in ground water. Ground Water. 2006 Mar-Apr; 44(2):129.

- Bromide exceeded the previous historical maximum concentration of 0.20 mg/L at MW06-01 in July and October 2023 with concentrations of 0.24 mg/L and 0.23 mg/L, respectively;
- Bromide exceeded the previous historical maximum concentration of 0.24 mg/L at MW-401B in October 2023 with a concentration of 0.25 mg/L;
- Bromide exceeded the previous historical maximum concentration of 0.10 mg/L at OW-605A in July 2023 with a concentration of 0.13 mg/L;
- Bromide exceeded the previous historical maximum concentration of 0.13 mg/L at OW-606A in July 2023 with a concentration of 0.16 mg/L;
- Bromide was detected at the laboratory reporting limit of 0.1 mg/L at OW-611A in July 2023 (0.10 mg/L) for the first time since monitoring began at that location in April 2018; and
- Bromide was detected at the laboratory reporting limit of 0.1 mg/L at P-04-04 in July 2023 (0.10 mg/L) and above the laboratory reporting limit in October 2023 (0.11 mg/L) for the first and second time since bromide sampling began at that location in April 2013.[9]

The 2023 bromide detections and chloride to bromide ratios are summarized in Table 8-2. The bromide concentrations above the laboratory reporting limits during 2023 are generally within the range of naturally occurring bromide concentrations in Maine, particularly in locations such as the JRL site that were in the area of post-glacial sea submergence.[10]

The chloride to bromide ratios summarized in Table 8-2 for the groundwater, underdrain, leak detection, pore-water, and surface water monitoring locations are broad ranging (i.e., from 15 to 1 to 480 to 1), with a median ratio of approximately 104 to 1. The standard deviation of the 42 chloride to bromide ratios calculated is 94, which indicates a high standard deviation and that the data are spread out and not tending toward values similar to the chloride to bromide ratios of the leachate. Only one of the 42 calculated chloride to bromide ratios fell within the same range as JRL leachate monitoring location LT-C4LR during 2023.

The chloride concentrations associated with bromide detections were generally low and ranged from 1.5 mg/L at MW04-109R in October 2023 to 48 mg/L at OW-611B in July 2023. Thirty one of the 42 chloride concentrations associated with bromide detections during 2023 were at concentrations of less than 20 mg/L.

[9] Note that the bromide was reported at not detected above the laboratory reporting limit of 0.2 mg/L at P-04-04 in July and October 2016 and April and July 2017.

[10] Snow, M.S., Kahl, J.S., Norton, S.A., Olson, C., 1990. Geochemical determination of salinity sources in ground water wells in Maine. Proc., Focus Conference on Eastern Regional Ground Water Issues, Ground Water, Management No. 3, 1990, pp. 313-327.

Based on a study of 32 locations across 24 states in the United States, potable groundwater that has less than 10 mg/L chloride (which is a similar concentration to most JRL sampling locations) had chloride to bromide ratios ranging from 43 to 1 to 285 to 1 with a median ratio of 101 to 1.[11] These values are generally consistent with the site monitoring locations where bromide was detected at low concentrations (see Table 8-2).

8.2 Underdrains

The JRL underdrain monitoring locations for the landfill and Detention Pond 1A are listed in Table 8-3. Where there was flow during 2023 from underdrain monitoring locations, the underdrain monitoring data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems.

There was no flow at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 during any of the three 2023 monitoring events; thus, no samples were obtained. 2023 occurrences of no flow at these underdrain monitoring locations are generally consistent with recently observed patterns. The lack of flowing conditions at underdrain monitoring locations that previously flowed regularly is associated with the lowering of the groundwater table that has resulted from the construction of the landfill expansion cells (see Section 1.2).

LF-UD-12+13+14, which was added to the detection monitoring program in July 2023, was sampled during the July 2023 monitoring event but there was no flow during the October 2023 monitoring event.
The sampling pipes in LF-COMP and LP-COMP were not submerged during the three 2023 monitoring events, so those locations were not sampled.

LF-COMP and LP-COMP samples were obtained and analyzed by NEWSME for field parameters during each month of 2023.

Comparison of Key Indicator Parameters at Underdrains to JRL Leachate and Summary of Statistically Significant Trend Results

The 2023 annual maximum specific conductance values and chloride and arsenic concentrations for underdrain monitoring locations are summarized in Table 8-3. The Mann-Kendall analyses results for statistically significant trends for these parameters are summarized in Table 8-3 as well. The complete results for Mann-Kendall analyses are provided in Appendix F.

TABLE 8-3

2023 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT UNDERDRAIN MONITORING LOCATIONS

Location Designation	Annual Maximum Specific Conductance (20,000 µmhos/cm in JRL Leachate in April 2023)		Annual Maximum Chloride (5,000 mg/L in JRL Leachate in April and July 2023)		Annual Maximum Arsenic (0.43 mg/L in JRL Leachate in July 2023)	
	µmhos/cm	Statistically Significant Trend (5-year)	mg/L	Statistically Significant Trend (5-year)	mg/L	Statistically Significant Trend (5-year)
LF-COMP	490	–	NS	I	NS	I
LF-UD-1	NS	I	NS	I	NS	I
LF-UD-2	NS	I	NS	I	NS	I
LF-UD-3A,B	NS	I	NS	I	NS	I
LF-UD-4	NS	I	NS	I	NS	I
LF-UD-5 and 6	379	Increasing	3.2	Increasing	0.005 U	–
LF-UD-6	NS	I	NS	I	NS	I
LF-UD-7	NS	I	NS	I	NS	I
LF-UD-8	NS	I	NS	I	NS	I
LF-UD-9	NS	I	NS	I	NS	I
LF-UD-10	NS	I	NS	I	NS	I
LF-UD-12+13+14	756	I	5.3	I	0.005 U	I
LP-COMP	482	Increasing	NS	I	NS	I
LP-UD-1	NS	I	NS	I	NS	I
LP-UD-2	567	Increasing	2.8	Decreasing	0.005 U	–

Notes:
U = not detected above indicated laboratory reporting limit
NS = Insufficient liquid to obtain a sample in 2023
– = no trend
I = insufficient data

Annual maximum specific conductance values during 2023 from LF-COMP, LF-UD-5 and 6, LF-UD-12+13+14, LP-COMP, and LP-UD-2 ranged from 379 µmhos/cm (LF-UD-5 and 6 in October 2023) to 756 µmhos/cm (LF-UD-12+13+14 in August 2023). While these values are greater than background specific conductance values (e.g., an annual maximum specific conductance value of 233 µmhos/cm at MW-206 in April 2023), the annual maximum chloride and arsenic concentrations at LF-UD-5 and 6, LF-UD-12+13+14, and LP-UD-2 remain very low or non-detect and do not indicate the influence of JRL leachate. The chloride concentrations among these locations were low with an overall annual maximum value of 5.3 mg/L measured at LF-UD-12+13+14 in July 2023 (chloride was detected in leachate at a concentration of 5,000 mg/L at LT-C4LR in April and July 2023). Arsenic was not detected above the laboratory reporting limit of 0.005 mg/L in any underdrain monitoring locations sampled during 2023 (i.e., LF-UD-5 and 6, LF-UD-12+13+14, and LF-UD-2).

Of note is that the greatest specific conductance value measured in the underdrains in August 2023 at LF-UD-12+13+14 (756 µmhos/cm in August 2023) is anomalously high compared to the monthly measurements in January, February, April, July, and December 2023, which ranged from 100 to 187

µmhos/cm. There was no flow at LF-UD-12+13+14 during the March, May, June, September October, and November 2023 monitoring.

There are insufficient data for five-year Mann-Kendall analyses at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 due to the lack of sufficient liquid to obtain a sample at those locations.

For underdrain monitoring locations with sufficient data for analysis, the Mann-Kendall trend analyses for the key indicator parameters (i.e., specific conductance, chloride, and arsenic) generally indicate:

- Stable to increasing trends for specific conductance;
- Stable to increasing trends for the landfill underdrain locations and decreasing trends for the Detention Pond 1A underdrain (i.e., LP-UD-2); and
- No trends for arsenic.

While there are statistically significant increasing trends for chloride at LF-UD-5 and 6 and LP-UD-2, the chloride concentrations at these locations remain very low.

Of the underdrain monitoring locations with sufficient data for Mann-Kendall trend analyses, there were no instances of multiple parameters (i.e., four or more) with three-year statistically significant increasing and/or decreasing trends.

Of the underdrain monitoring locations with sufficient data for Mann-Kendall trend analyses, there was one instance of multiple parameters (i.e., four or more) with five-year statistically significant increasing and/or decreasing trends. There were six parameters (alkalinity, bicarbonate, calcium, specific conductance, total dissolved solids, and turbidity) with statistically significant increasing trends over the past five years at LP-UD-2. Review of the LP-UD-2 data does not indicate influence from the JRL leachate. The 2023 annual maximum chloride concentration at LP-UD-2 was very low (2.8 mg/L in April 2023) and parameters with statistically significant increasing trends at LP-UD-2 generally have similar or marginally greater values compared with upgradient monitoring locations MW-206 and P-206A.

The complete results of the Mann-Kendall analyses are included in Appendix F.

There were no new historical maximum values reported during 2023 monitoring at the underdrain monitoring locations. There were five parameters (calcium, magnesium, potassium, total dissolved solids, and sulfate) with new historical minimum concentrations reported during 2023 at underdrain monitoring location LF-UD-5 and 6.

2023 Underdrain VOCs

VOCs were analyzed at all sampled underdrain locations, both landfill and Detention Pond 1A (former leachate pond) underdrains in April 2023. There were no VOCs detected in 2023 above laboratory reporting limits at any of the sampled underdrain locations.

8.3 Groundwater Quality

During 2023, routine water quality samples were obtained from the 45 monitoring well locations that had sufficient water quantity for sampling at the JRL during the April, July, and October 2023 monitoring events.[12] With few exceptions, historical water quality data from groundwater monitoring locations at the JRL are consistent with their setting, the groundwater flow conditions at the monitoring locations, and normal construction and operational activities of the landfill. Site groundwater data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The 2023 water quality data remain consistent with these interpretations.

Comparison of Key Indicator Parameters at Groundwater Monitoring Locations to JRL Leachate and Summary of Statistically Significant Trend Results

A summary of site-wide groundwater quality in 2023 at the JRL is provided in Table 8-4. The table contains a comparison of 2023 values of key indicator parameters (i.e., specific conductance, chloride, and arsenic) from leachate monitoring location LT-C4LR to the site's 50 groundwater monitoring locations and current statistically significant trends of the key indicator parameters. The table also includes a summary of locations identified with statistically significant trends for multiple (i.e., four or more) parameters. The complete results of the Mann-Kendall trend analyses are provided in Appendix F. The groundwater monitoring locations shown in Table 8-4 are listed in order of 2023 annual maximum specific conductance values by location from high to low.

[12] See footnotes 4 through 6 from Section 3.1.

Notes:

[1] Locations shown with non-bold text have water quality that: (1) does not indicate influence from landfill leachate; and (2) shows limited influence from landfill construction operations. Locations shown with bold text currently have more pronounced water quality changes that are largely attributable to changes in redox conditions related to construction of the landfill and/or landfill operations, and do not indicate significant landfill related impacts to water quality from malfunction of landfill liners. Section 8.3 includes extended discussions for the locations shown with bold text.

[2] Number of parameters with trends shown in parenthesis for analyses with four or more trends. Locations monitored for field parameters only (i.e., DP-4, MW04-105, MW-204) are not assessed for multiple (i.e., four or more) parameters.

[3] Insufficient data for detection monitoring parameters (i.e., trends available for field parameters only).

U = not detected above indicated laboratory reporting limit
NS = not sampled in 2023
– = no trend
I = insufficient data

Arsenic concentrations site-wide are generally low and did not exceed the MCL of 0.01 mg/L at 39 of the 45 monitoring locations where arsenic was monitored in 2023. At the six groundwater monitoring locations where arsenic did exceed the MCL (MW-227, MW-401B, MW-402A, MW-402B, P-04-11A, and MW-505), arsenic concentrations were only detected as high as 0.020 mg/L (at MW-402B in April 2023). The noted exceedances did not occur in conjunction with elevated chloride concentrations (see Table 8-4).

Based on review of Table 8-4 and a visual review of plotted 2023 and historical data, SME has identified 30 of the 50 site-wide groundwater monitoring locations with water quality that: (1) do not indicate influence from landfill leachate; and (2) currently show limited influence from landfill construction operations. These 30 groundwater monitoring locations are identified in Table 8-4 as the locations with non-bold text. The 2023 annual maximum specific conductance values at these wells range from 56 µmhos/cm to 372 µmhos/cm. The 2023 annual maximum chloride concentrations at these monitoring locations were low and ranged from 1.3 mg/L to 19 mg/L. For these reasons, extended discussion on these wells is not warranted at this time.

More pronounced water quality changes have been observed at multiple groundwater monitoring locations, both upgradient and downgradient from the landfill. These changes are evidenced at some monitoring locations by statistically significant trends, as summarized in Table 8-4, for multiple parameters. These trends are largely attributable to landfill construction (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and changes in redox conditions due to the reduction of groundwater recharge from precipitation, and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners.

SME has identified 19 of the site monitoring locations that currently warrant additional discussions. These monitoring locations, shown by bold text in Table 8-4, are: (1) upgradient monitoring locations MW12-303R and P-206A; (2) MW04-109R, MW09-901, MW-223A, MW-223B, and MW-301, which are downgradient from Cells 1 through 10 of JRL; and (3) OW-06-03, OW-601A, OW-601B, OW-602A, OW-604A, OW-606A, OW-610A, OW-611A, MW-506, MW-508, P-04-07A, and P-04-07B, which are downgradient from the landfill expansion. Groundwater quality at these monitoring locations is discussed below.

Extended Discussion on JRL Groundwater Quality

Upgradient Monitoring Locations MW12-303R and P-206A: Groundwater monitoring locations MW12-303R and P-206A are categorized as upgradient from the JRL; however, as the east side of the JRL (i.e., the upslope edge) is situated along the crest of a northwest-southeast trending drumlin, these upgradient monitoring locations are not fully hydraulically isolated from the landfill and operations outside of the area of landfill construction (see interpreted phreatic surface and groundwater potentiometric surface maps in Appendix B).

P-206A is a bedrock piezometer located southeast from the landfill and outside of the area of landfill construction. P-206A was added to the monitoring program during the July 2013 sampling event to provide an additional upgradient bedrock monitoring location. Review of the water quality data at P-206A shows that there were increases for multiple parameters over the past several years; however, the groundwater quality at P-206A is still generally characterized by low parameter concentrations. The Mann-Kendall analyses indicate that there are statistically significant increasing trends for five parameters at P-206A for the past five years (calcium, Eh, magnesium, nitrate plus nitrite, and sulfate). This is an improvement from the seven parameters identified at this location with statistically significant increasing trends during last year's analysis (i.e., from 2018 through 2022) and there are also now six parameters (arsenic, manganese, pH, potassium, sodium, and total suspended solids) with statistically significant decreasing trends at P-206A over the past five years. The 2023 annual maximum values for parameters identified with current or recent increasing trends are:

- Calcium (26 mg/L in October 2023);
- Eh (347 mV in April 2023);
- Magnesium (8.5 mg/L in April 2023);
- Nitrate plus nitrite (0.42 mg/L in April 2023); and
- Sulfate (5.4 mg/L in July 2023).

The nitrate plus nitrite concentrations at P-206A were below the MCLs for both nitrate (10 mg/L and nitrite (1 mg/L) and the sulfate value was well below the DWA of 500 mg/L. There were no health-related Maine drinking water standard (i.e., MCL, LHA, or DWA) exceedances at P-206A during 2023 for the parameters analyzed.

There were new historical maximum values detected for total dissolved solids and sulfate at P-206A during 2023. These parameters, as well as other parameters that have exhibited increases over the past several years and still generally have 2023 values that remain relatively low and consistent with expectations in their site setting (i.e., consistent with groundwater upgradient from the landfill but in the area of the landfill facility). Specific conductance values and chloride concentrations are currently stable at P-206A with no statistically significant increasing or decreasing trends over the past three years or five years. The annual maximum specific conductance value at P-206A was 314 µmhos/m in April 2023. The annual maximum chloride concentration at P-206A during 2023 was 22 mg/L (July and October 2023).

Since groundwater quality at P-206A is still characterized by low parameter concentrations and the increasing water quality trends appear to be subsiding, SME does not interpret the current water quality at P-206A as related to the performance of landfill cells or leachate collection and transport systems. Monitoring location P-206A is located proximate to the looped road that accesses the JRL leachate storage

tank. SME recommends that on-site snow removal and winter roadway maintenance practices minimize stockpiling of snow around this well.

MW12-303R is located in an area that historically has been influenced by roadway maintenance and runoff and from site construction activities. Water quality at MW12-303R was generally consistent with that at upgradient well MW-206, from when MW12-303R was first sampled in 2012 until between 2015 and 2016. Since that time, multiple water quality parameters at MW12-303R have increased. Visual inspection of the area surrounding the well in 2018 showed the well was located in a topographic depression and that it is located near the beginning of the access road to Cell 10, which began receiving waste in October 2017. It is likely that stormwater runoff from the vicinity of the access road had contributed to the water quality changes at MW12-303R. It was also determined that plowed snow was piled in the area surrounding MW12-303R during the winter of 2018 and during previous years. In early summer of 2018, the access roadway and the area surrounding MW12-303R were regraded to divert stormwater runoff away from the well and the well was purged. No adverse impacts to water quality were observed at MW12-303R in 2023 despite the Stage 1 Closure construction being conducted on the landfill immediately adjacent to MW12-303R during the late summer and fall of 2023.

The water quality parameters at MW12-303R appear to be improving. Assessments of conditions and site activities in the vicinity of MW12-303R have been reported in recent annual water quality reports and resulted in site management improvements including access roadway regrading and snow handling procedures. While there were seven parameters identified with statistically significant increasing trends for data from 2013 through 2017, including specific conductance and chloride, there were no water quality parameters for the past three years with statistically significant increasing trends and only two parameters (iron and total suspended solids) with increasing trends over the past five years. Improvements to groundwater quality are also shown by statistically significant decreasing trends for eight parameters (bromide, calcium, Eh, organic carbon, potassium, sulfate, total dissolved solids, and total Kjeldahl nitrogen) over the past five years. These improvements to groundwater quality suggest a reduction of infiltration of water in the area of MW12-303R over the past several years.

There were no parameters at MW12-303R that were outside of historical range during 2023.

Specific conductance, chloride, and arsenic values at MW12-303R have declined substantially since they were reported at historical maximum values between 2016 and 2018, which are shown in Table 8-5.

TABLE 8-5

SUMMARY OF 2023 KEY INDICATOR PARAMETER VALUES AT MW12-303R

Parameter	October 2012 Value	Historical Maximum Value	2023 Range of Values
Specific Conductance (µmhos/cm)	189	1,711 (April 2018)	284 (July 2023) to 487 (April 2023)
Chloride (mg/L)	4.9	220 (April 2018)	12 (April and October 2023) to 14 (July 2023)
Arsenic (mg/L)	0.005 U	0.036 mg/L (July 2016)	0.005 U (April, July, October 2023)

Note:
U = not detected above indicated laboratory reporting limit

Manganese exceeded its LHA of 0.3 mg/L at MW12-303R in April 2023 (0.49 mg/L). There were no other parameters analyzed at MW12-303R with MCL, LHA, or DWA exceedances in 2023.

Stiff and Piper diagrams were plotted using July 2023 data for upgradient monitoring wells MW12-303R and P-206A, as well as for upgradient monitoring location MW-206 and leachate monitoring location LT-C4LR; diagrams are provided in Appendix G. These diagrams show similar ionic ratios among the upgradient monitoring wells in July 2023 and a clear distinction from the chemical signature of the leachate from LT-C4LR in July 2023 (see Appendix G).

SME does not interpret the recent water quality trends at MW12-303R and P-206A as related to the performance of landfill cells or leachate collection and transport systems. This is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations (see Section 8.2) and leak detection monitoring locations (see Section 8.5).

Downgradient Monitoring Locations MW-223A and MW-223B: Groundwater monitoring wells MW-223A and MW223B monitor the bedrock and overburden groundwater, respectively, hydraulically downgradient and northwest of the JRL. In previous years' site water quality evaluations, SME has specifically addressed monitoring wells MW-223A and MW-223B, located along the northwest perimeter of the landfill, and potential site activities responsible for the water quality in these wells.[13,14] Additional insight into the water quality changes at these wells was discussed in the 2016 through 2020 site water quality evaluations, with the sampling of the former Scale House Well and former Office Well during those years. The evaluations determined that similarities existed among the former Scale House Well, the former Office Well, former monitoring well MW-302R, and MW-223A and MW-223B, and showed that they are distinct from the chemical signature of the leachate from LT-C4LR. The similarities in water quality in these wells are consistent with the known hydrogeology in this area of the site, which indicate a

[13] SME, April 2015. 2014 Annual Water Quality Report, Juniper Ridge Landfill, prepared for NEWSME Landfill Operations LLC.

[14] SME, April 2016, 2015 Annual Water Quality Report, Juniper Ridge Landfill, prepared for NEWSME Landfill Operations LLC.

preferential groundwater flow direction exists from northeast to southwest from the vicinity of the former Scale House toward former monitoring well MW-302R and monitoring wells MW-223A, and MW-223B.[15] This suggests that water quality in monitoring wells MW-223A and MW-223B may in part be associated with upgradient water quality in the vicinity of the former Office Well and former Scale House Well in addition to the sources previously identified. A former topsoil and stump stockpile area and a subsurface wastewater disposal field which is no longer in use were also located along this preferential groundwater flow direction. Construction of landfill Cell 15 adjacent to MW-223A and MW-223B during 2022 and 2023 could be responsible for any parameter increases beginning in 2022 and continuing for the next several years.

Table 8-6 summarizes the 2023 annual maximum water quality parameter results for eight parameters at monitoring wells MW-223A and MW-223B that are elevated with respect to upgradient groundwater quality. Arsenic concentrations at MW-223A and MW-223B were not elevated with respect to upgradient groundwater quality but arsenic is included in Table 8-6 since it is a key indicator parameter for comparison to JRL leachate.

TABLE 8-6

SUMMARY OF 2023 ANNUAL MAXIMUM WATER QUALITY PARAMETER VALUES AT MW-223A, AND MW-223B

Parameter	MW-223A	MW-223B	Upgradient Comparison (MW-206)
Specific Conductance (µmhos/cm)	675	611	233
Arsenic (mg/L)	0.005 U	0.005 U	0.0009
Calcium (mg/L)	110	80	19
Magnesium (mg/L)	12	19	5.4
Sodium (mg/L)	6.4	7.9	4.6
Total Dissolved Solids (mg/L)	408	356	100
Sulfate (mg/L)	19	16	4.3
Bicarbonate (mg/L)	270	220	73 [1]
Chloride (mg/L)	26	32	2.6

Note:
[1] Value shown is for alkalinity. Bicarbonate is not monitored at MW-206.

U – not detected above the indicated laboratory reporting limit

Piper and Stiff diagrams were plotted using July 2023 data for MW-223A and MW-223B, upgradient monitoring well MW-206, and the leachate sampled at LT-C4LR. The Piper and Stiff diagrams for these locations, which are provided in Appendix G, show similar chemical signatures for monitoring locations

[15] SME, May 13, 2016, Letter to MEDEP regarding Juniper Ridge Landfill Expansion Application, MEDEP #S-020700WD-BI-N, follow-up to Department Staff's responses to the March 4, 2016 submittal on Staff's review comments as presented in the Department's April 5, 2016 letter (Attachment SME-D3, Figures U-14B- Bedrock Amended and Figure U-14B- Till Amended).

MW-223A and MW-223B with greater influence from calcium cations and bicarbonate alkalinity anions compared to upgradient monitoring location MW-206. There is a clear distinction from the chemical signature of the leachate from LT-C4LR compared to MW-223A and MW-223B.

Visual review of water quality trends at MW-223A and MW-223B show distinct increases in parameter concentrations since about 2005 or later. There are statistically significant increasing trends at MW-223A for six parameters (bicarbonate, calcium, magnesium, nitrate plus nitrite, specific conductance, and total dissolved solids) over the past five years. Of note is that there is a statistically significant decreasing trend in chloride concentrations at MW-223A over the past five years. Chloride, a key indicator for leachate influence in groundwater, was detected at an annual maximum concentration of 26 mg/L at MW-223A in July and October 2023. Chloride concentrations at MW-223A have steadily decreased since it was detected at a historical maximum concentration of 57.6 mg/L in April 2014. There were not multiple parameters (i.e., four or more) at MW-223A with statistically significant increasing trends over the past three years or with decreasing trends over the past five years.

There are statistically significant increasing trends at MW-223B for six parameters (bicarbonate, calcium, magnesium, potassium, sulfate, and total dissolved solids) over the past five years. There are statistically significant decreasing trends for four parameters (pH, Eh, dissolved oxygen, and chloride) at MW-223B over the past five years. There are statistically significant decreasing trends at MW-223B for four parameters (chloride, dissolved oxygen, Eh, and pH) over the past five years. The previously increasing chloride concentrations at MW-223B have generally been decreasing over the past five years, which is supported by the statistically significant decreasing trends for chloride over the past five years. Chloride was detected at an annual maximum concentration of 32 mg/L at MW-223B in April 2023. This is a decrease compared to the historical maximum chloride concentration of 55.7 mg/L at MW-223B in April 2014.

Dissolved methane has been sampled at MW-223B as part of a supplemental monitoring program to evaluate potential influence of landfill gas to the groundwater at that location. During the past ten years of monitoring dissolved methane concentrations at MW-223B, it has only been detected above the laboratory reporting limit of 20 µg/L once at a concentration of 30 µg/L in October 2014. The supplemental dissolved methane monitoring at MW-223B indicates that JRL landfill gas is not migrating away from the landfill in vicinity of that well.

There were three groundwater quality parameters detected at new historical maximum values at MW-223A in 2023: specific conductance (675 µmhos/cm in April 2023), nitrate plus nitrite (1.2 mg/L in July 2023), and total suspended solids (9 mg/L in April 2023). There were four groundwater quality parameters detected at new historical maximum values at MW-223B in 2023: bicarbonate (220 mg/L in October 2023), specific conductance (611 µmhos/cm in April 2023), magnesium (19 mg/L in April and July 2023), sodium (7.9 mg/L in October 2023), and total dissolved solids (356 mg/L in July 2023).

There were no MCL, LHA, or DWA exceedances of analyzed parameters at MW-223A and MW-223B in 2023.

We do not interpret recent water quality and noted trends at MW-223A and MW-223B as related to the performance of landfill cells or leachate collection and transport systems. This is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations (see Section 8.2) and leak detection monitoring locations (see Section 8.5).

Downgradient location MW-301: Monitoring well MW-301 is a deep bedrock monitoring well (screened between 162.7 and 182.7 feet below ground surface) located downgradient from the landfill in proximity of the Detention Pond 1A. The groundwater quality at MW-301 is consistent with its setting as a monitoring location downgradient from the landfill. There are no current concerns with water quality results at this well location related to the performance of landfill cells or leachate collection and transport systems.

As previously reported, MW-301 was damaged prior to April 2013. Following 2013 repairs to the well, groundwater elevations rose approximately 4 feet, and multiple parameters have been observed to increase generally between 2013 and 2019.[16] The groundwater quality at MW-301 has generally stabilized since 2019. There was only one parameter at MW-301 outside of its historical range during 2023, which was a new historical minimum value for Eh. Parameter concentrations at MW-301 remained relatively low during 2023 and the Mann-Kendall analyses indicate that there were not multiple parameters (i.e., four or more) at MW-301 with statistically significant increasing or decreasing trends over the past five years. There were no parameters analyzed at MW-301 that exceeded MCL, LHA, or DWA standards in 2023.

The 2023 specific conductance values at MW-301 ranged from 242 µmhos/cm in July 2023 to 333 µmhos/cm in April 2023, remaining generally consistent with the historical range of values at upgradient monitoring location MW-206. The historical maximum specific conductance value at upgradient monitoring location MW-206 is 323 µmhos/cm (October 2022). Chloride concentrations at MW-206 in 2023 are generally consistent with concentrations detected at MW-206 since 2019.

Piper and Stiff diagrams were plotted using July 2023 data for MW-301 and the leachate sampled at LT-C4LR. The Piper and Stiff diagrams for these locations, which are provided in Appendix G, show a clear distinction from the chemical signature of the leachate from LT-C4LR compared to MW-301. The chemical signature of the July 2023 water quality from MW-301, as shown on the Stiff diagrams, is also very similar to the chemical signatures of the upgradient monitoring wells.

[16] SME, 2020. 2019 Annual Water Quality Report, Juniper Ridge Landfill, Prepared for NEWSME Landfill Operations, LLC. April 2020.

Downgradient locations MW04-109R and MW09-901: Monitoring locations MW04-109R and MW09-901 are located downgradient from Cell 5 of the JRL and monitor shallow overburden groundwater.

There were no parameters analyzed at MW09-901 that exceeded MCL, LHA, or DWA standards in 2023. Manganese exceeded its LHA of 0.3 mg/L in July 2023 (6.0 mg/L) and October 2023 (3.6 mg/L) at MW04-109R. There were no other parameters at MW04-109R that exceeded MCL, LHA, or DWA standards in 2023. While the manganese LHA exceedances at MW04-109R during 2023 were not first-time exceedances, it is of note that the manganese values were anomalously high during the July and October 2023 monitoring events. The new historical maximum manganese concentration of 6.0 mg/L at MW04-109R, which has been sampled since 2009, was preceded by a historical maximum value of 1.4 mg/L. Review of the 2023 water quality data at this location indicates that nearly all other groundwater quality parameters were consistent with recent historical data; however, there was a new historical maximum concentration of 0.11 mg/L detected for iron in July 2023. While this iron concentration remains low, the increase in iron and manganese concentrations may be an indication of a decrease in the oxidation-reduction potential in the groundwater associated with the landfill construction. This is supported by the decrease in Eh values from 334 mV in April 2023 to 111 mV in July 2023.

Landfill Expansion downgradient locations OW-06-03, OW-601A, OW-601B, OW-602A, OW-604A, OW-606A, OW-610A, OW-611A, MW-506, MW-508, P-04-07A, and P-04-07B: Monitoring locations OW-06-03, OW-601A, OW-601B, OW-602A, OW-604A, and OW-606A are located east and hydraulically downgradient of the landfill expansion cells. Monitoring locations OW-610A, OW-611A, MW-506, MW-508, P-04-07A, and P-04-07B are located west of and downgradient from the landfill expansion cells. Baseline groundwater quality was monitored at these locations between 2018 and 2023. Detection monitoring began at OW-06-03, OW-601A, OW-601B, OW-602A, and OW-604A in 2019, at OW-606A, OW-611A, and MW-507 in 2021, at MW-506 in 2022, and at MW-508, OW-610A, P-04-07A, and P-04-07B in 2023.

In general, multiple parameters at many of the landfill expansion monitoring locations have exhibited greater values than at upgradient monitoring well MW-206, including the key indicator parameters specific conductance and chloride. Arsenic concentrations at the subject landfill expansion monitoring locations were below the MCL of 0.01 mg/L during 2023. The annual maximum values of the key indicator parameters for the subject landfill expansion monitoring locations are summarized in Table 8-4.

The greater parameter values observed at landfill expansion monitoring location during 2023 (e.g., the specific conductance value of 775 µmhos/cm in April 2023) are likely caused by the ground disturbance associated with the landfill expansion cells that have been constructed to date and the change in redox conditions in the soil and groundwater from cutting off precipitation recharge in those areas. Additionally, monitoring locations OW-06-03, OW-601A, OW-601B, OW-602A, OW-604A, and OW-606A are located in close proximity to the landfill access road and may be influenced by winter road salting (e.g., the chloride

concentration of 41 mg/L at OW-601B in July 2023). Leak detection monitoring for landfill expansion Cells 11 through 15 indicate that the cells are performing as designed, as discussed in Section 8.5. Chloride concentrations at leak detection monitoring locations for Cells 11 through 15 in 2023 ranged from less than the laboratory reporting limit of 1 mg/L to a maximum of 2.9 mg/L and were very low compared to JRL leachate (5,000 mg/L at LT-C4LR in April and July 2023).

Parameter concentrations at the landfill expansion downgradient monitoring locations are expected to decrease and stabilize with additional time following the construction of the landfill expansion cells. These decreases and stabilization of water quality parameter values has been observed, for example, at monitoring location MW-506, which is included in this expanded discussion but has had substantial water quality improvements since its baseline monitoring in 2021. The specific conductance value in February 2021 at MW-506 was 837 µmhos/cm and have since steadily decreased to a historic minimum value of 319 µmhos/cm in October 2023. Similarly, the chloride concentration at MW-506 has decreased from 57 mg/L in February 2021 to a historic minimum of 4.0 mg/L October 2023.

There is insufficient groundwater quality data to perform Mann-Kendall trend analyses at MW-506, MW-508, OW-606A, WO-610A, and OW-611A over the past five years. There was only sufficient data to perform Mann-Kendall trend analyses for field parameters at OW-06-03 over the past five years due to that location frequently being dry or having insufficient water for obtaining samples for laboratory analyses. The results for the Mann-Kendall analyses for OW-601A, OW-601B, OW-602A, and OW-604A are discuss as follows:

- There were not multiple parameters (i.e., four or more) at OW-601A and OW-601B with statistically significant increasing or decreasing trends over the past five years;
- There were seven parameters (calcium, chloride, magnesium, potassium, sodium, specific conductance, and total dissolved solids) at OW-602A with statistically significant increasing trends over the past five years; and
- There were six parameters (calcium, chloride, magnesium, nitrate plus nitrite, specific conductance, and total dissolved solids) at OW-604A with statistically significant increasing trends over the past five years.

There were no MCL, LHA, or DWA exceedances for parameters analyzed at MW-508, OW-601A, OW-601B, OW-602A, OW-604A, OW-606A, and OW-611A during 2023. Monitoring well OW-06-03 was either dry or had insufficient water for sample collection during 2023. The MCL, LHA, and DWA exceedances for parameters monitored for at MW-506, OW-610A, P-04-07A, and P-04-07B during 2023 are provided later in this section (see Table 8-7).

Stiff diagrams were plotted using July 2023 data for landfill expansion downgradient monitoring wells OW-601A, OW-601B, OW-602A, OW-604A, OW-606A, OW-610A, OW-611A, MW-506, MW-508, P-04-07A, and P-04-07B, which are provided in Appendix G. These Stiff diagrams generally show similar chemical characterizations to each other and in July 2023 and a clear distinction from the chemical signature of the leachate from LT-C4LR in July 2023 (see Appendix G).

VOCs at JRL Groundwater Monitoring Well Locations

VOCs were analyzed at MW-401B in April 2023; no VOCs were detected above the laboratory reporting limits.[17]

MCL, LHA, and DWA Exceedances at JRL Groundwater Monitoring Well Locations

Parameters detected at concentrations that were above MCLs, LHAs, or DWAs at groundwater detection monitoring locations in 2023 are identified in Table 8-7.[18]

With the exception of the arsenic MCL exceedance in April 2023 at MW-505, each of the MCL, LHA, and DWA exceedances listed in Table 8-7 have occurred at their respective locations in the past. The occurrence of arsenic MCL exceedances in groundwater is largely attributable to reducing conditions associated with decreasing groundwater recharge from site development.

[17] VOC analyses were also completed for 2023 baseline monitoring, which were reported to MEDEP in 2023.
[18] MCL, LHA, and DWA exceedances for 2023 baseline monitoring locations are included in Table 8-7.

TABLE 8-7

2023 MCL, LHA, AND DWA EXCEEDANCES AT GROUNDWATER MONITORING LOCATIONS

Location Designation	Sulfate (mg/L) (500 mg/L DWA)	Ammonia (mg/L) (30 mg/L LHA)	Boron (mg/L) (6 mg/L LHA)	Sodium (mg/L) (20 mg/L DWA)	Manganese (mg/L) (0.3 mg/L LHA)	Copper (mg/L) (1.3 mg/L MCL)	Arsenic (mg/L) (0.01mg/L MCL)

Notes:

[1] Nitrate plus nitrite samples for 2023 groundwater monitoring locations were all less than the MCL for nitrate of 10 mg/L. There were four monitoring locations during 2023 where the nitrate plus nitrite concentrations were greater than the MCL for nitrite of 1.0 mg/L and, while unlikely, it cannot be verified that nitrite was below its MCL of 1.0 mg/L at those locations at those times. These instances include: 1.1 mg/L at MW-223A in April and October 2023, 1.2 mg/L at MW-223A in July 2023, 1.1 mg/L at OW-611A in July 2023, 1.3 mg/L at MW12-303R in April 2023, and 3.2 mg/L at OW-604A in July 2023.

NS = not sampled
– = no exceedance

Dissolved Methane

Samples were obtained for dissolved methane analyses at monitoring wells MW-08-01, MW-206, MW-501, MW-502, MW-503, MW-504, MW-505, MW-506, MW-507, MW-04-09A, and MW-04-09B during the April, July, and October 2023 monitoring rounds. Samples were obtained for dissolved methane analyses at OW-601A, MW-601B, OW-602A, OW-604A, OW-605A, OW-606A, OW-606B, OW-607B, OW-608A, OW-608B, OW-609B, OW-610A, OW-611A, P-04-11A, and P-04-11B in July 2023. Samples were also obtained for dissolved methane analyses at monitoring wells MW-223B (April 2023), MW06-01 and

P-206A (July and October 2023), P-04-07A and P-04-07B (May, April, June, and July 2023), and MW-508 (May, April, June, July, and October 2023).

With the exceptions of MW06-01, OW-602A, and OW-610A dissolved methane was not detected above the laboratory reporting limit of 20 µg/L at these wells during 2023.

Dissolved methane was detected at MW06-01 at a concentration of 110 µg/L in July 2023 and 230 µg/L in July 2023 in October 2023. Dissolved methane was also detected at OW-602A at a concentration of 130 µg/L in July 2023 and at OW-610A at a concentration of 150 µg/L in July 2023.

8.4 Surface Water, Stormwater, and Pore-Water

Surface water at the site was monitored in 2023 at three locations on the southwest side of the landfill along a southwesterly unnamed tributary to Pushaw Stream (SW-1, SW-2, and SW-3) and one location northeast of the Site in a separate, more northerly tributary to Pushaw Stream (SW23-4). The latter of these locations, SW23-4, was added to the monitoring program during 2023 as part of the current JRL expansion monitoring. Stormwater was monitored at two stormwater detention ponds (SW-DP1 and SW-DP6) during 2023. Additionally, three pore-water sampling locations were monitored in 2023 at PWS10-1, PWS10-2, PWS10-3 along the landfill side of the bank of the unnamed tributary to Pushaw Stream and one pore-water sampling location was monitored at PWS-4 northeast of the landfill in the vicinity of SW23-4. The latter of these locations, PWS-4, was added to the monitoring program during 2023 as part of the current JRL expansion monitoring. The surface water, stormwater, and pore-water monitoring locations were each sampled in April, July, and October 2023. Monitoring locations SW23-4 and PWS-4 were also sampled in March and June as part of the baseline monitoring for those locations.

Comparison of Key Indicator Parameters at Surface Water, Stormwater, and Pore-Water Monitoring Locations to JRL Leachate and Summary of Statistically Significant Trend Results

The 2023 annual maximum specific conductance values and chloride and arsenic concentrations for the JRL surface water, stormwater, and pore-water monitoring locations are summarized in Table 8-8. The Mann-Kendall analyses results for statistically significant trends for these parameters are also provided in Table 8-8. The complete results for Mann-Kendall analyses are provided in Appendix F.

TABLE 8-8

2023 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT SURFACE WATER, STORMWATER, AND PORE-WATER MONITORING LOCATIONS

Location Designation	Annual Maximum Specific Conductance (20,000 µmhos/cm in JRL Leachate in April 2023)		Annual Maximum Chloride (5,000 mg/L in JRL Leachate in April and July 2023)		Annual Maximum Arsenic (0.43 mg/L in JRL Leachate in July 2023)	
	µmhos/cm	Statistically Significant Trend (5-Year)	mg/L	Statistically Significant Trend (5-Year)	mg/L	Statistically Significant Trend (5-Year)
SW-1	195	–	7.5	–	0.0055	–
SW-2	86	–	11	Decreasing	0.005 U	–
SW-3	91	–	11	–	0.005 U	–
SW23-4	227	I	13	I	0.010	I
SW-DP1	82	–	1.5	Decreasing	0.0096	–
SW-DP6	465	–	13	–	0.005 U	–
PWS10-1	201	–	6.5	Decreasing	0.0079	–
PWS10-2	199	–	10	–	0.005 U	–
PWS10-3	133	–	11	–	0.005 U	–
PWS-4	255	I	12	I	0.011	I

Notes:
U = not detected above indicated laboratory reporting limit
– = no trend
I – insufficient data

The 2023 surface water, stormwater, and pore-water monitoring location data are generally characterized by low values of key indicator parameters in comparison to the JRL leachate (i.e., LT-C4LR). This is consistent with historical data at these locations. The arsenic concentrations at the surface water, stormwater, and pore-water monitoring locations during 2023 were within their respective historical ranges (for locations with historical data prior to 2023). The arsenic concentration of 0.011 mg/L in April 2023 at pore-water monitoring location PWS-4, which is compared to the MCLs for groundwater, slightly exceeded the MCL of 0.01 mg/L but was not detected above the laboratory reporting limit of 0.005 mg/L in March, June, July, and October 2023. The specific conductance values and chloride concentrations at the surface water, stormwater, and pore-water monitoring locations were all within their respective historical ranges (for locations with historical data prior to 2023) with the exception of one new historical maximum value for specific conductance at SW-DP6 in July 2023 (465 µmhos/cm). This value exceeded the previous historical maximum value of 427 µmhos/cm; however, specific conductance values are generally lower at this location (e.g., 55 µmhos/cm in April 2023) with a mean value of 120 µmhos/cm since sampling began at this location in 2009.

The Mann-Kendall trends summarized in Table 8-8 indicate stable values for specific conductance at the pore-water monitoring locations. There are no trends for arsenic at surface water, stormwater, and pore-water monitoring locations over the past three to five years.

Further description of the JRL surface water, stormwater, and pore-water sampling locations and notable observations from their 2023 water quality data are provided below.

Surface Water Monitoring Locations: Along an unnamed southwesterly tributary to Pushaw Stream, surface water quality at SW-1, SW-2, and SW-3 has been very consistent since sampling began at these locations in the early 1990s. The few surface water quality parameters measured during 2023 were not within their respective historical ranges are summarized on the 2023 water quality data summary reports provided in Appendix E. Parameter concentrations during the 2023 sampling events at downstream locations SW-1 and SW-3 were generally similar to or marginally greater than those measured at SW-2, which is located upstream from the landfill. Parameters analyzed at SW-1 and SW-3, located downstream from the landfill, remain at relatively low values that do not indicate influence from landfill leachate. The slightly increased values at the downstream location are consistent with changes seen when natural surface water travels downstream from its source.

Surface water quality monitoring at SW23-4, along a northerly tributary to Pushaw Stream, began during 2023. Monitoring location SW23-4 was sampled during the April, July, and October 2023 and was also sampled as part of its baseline monitoring in March and June 2023. The 2023 data from SW23-4 indicates surface water quality similar to the historical water quality from SW-1, SW-2, and SW-3 along the unnamed tributary to Pushaw Stream.

The iron concentrations exceeded the MFCCC standard of 1 mg/L during the July 2023 monitoring event at SW-1 (11 mg/L), SW-2 (3.3 mg/L), and SW-3 (2.2 mg/L). The iron concentrations also exceeded the MFCCC during the October 2023 monitoring event at SW-1 (4.3 mg/L), SW-2 (1.1), and SW-3 (1.5). MFCCC exceedances for iron have occurred historically at these locations. Iron concentrations were below the MFCCC standard at SW-1, SW-2, and SW-3 in April 2023 and at SW23-4 during all 2023 monitoring events. The MFCCC of 0.00236 mg/L for copper was exceeded at SW23-4 during the July 2023 monitoring event (0.0027 mg/L) but was not exceeded during the March, April, July, and October monitoring events. There were no other MFCCC exceedances at SW-1, SW-2, SW-3, and SW23-4 for parameters analyzed during 2023.

There were not multiple parameters (i.e., four or more) with statistically significant decreasing trends at SW-1, SW-2, and SW-3 over the past three years and five years. The were four parameters (Eh, manganese, nitrate plus nitrite, and specific conductance) with statistically significant increasing trends at SW-3 over the past three years. There were four parameters (biological oxygen demand, potassium, phosphorus, and total suspended solids) with statistically significant increasing trends over the past five years at SW23-4.

There is currently insufficient data for Mann-Kendall trend analyses for the past five years at SW23-4.

Stormwater Monitoring Locations: Samples from SW-DP1 are obtained from a stormwater detention pond at the downstream western edge of the JRL site. Samples from SW-DP6 are obtained from a stormwater detention pond sampling location at the southern end of the site.

The historical range of parameter concentrations at SW-DP1 have generally been low since sampling began at this location in 2004 and have not indicated influences from landfill leachate or landfill operations. There was only one parameter at SW-DP1 that was outside of its historical range during 2023. Iron was detected at a new historical maximum concentration of 8.5 mg/L in July 2023, which exceeded the previous historical maximum concentration of 6.4 mg/L.

Stormwater quality monitoring at SW-DP6 began in October 2009. The stormwater quality at SW-DP6 during 2023 is typically characterized by continued low parameter concentrations that do not indicate influences from landfill leachate or landfill operations. The July 2023 monitoring results at SW-DP6; however, included several parameters with anomalously greater values. There were seven groundwater quality parameters detected at new historical maximum values at SW-DP6 in July 2023: specific conductance (465 µmhos/cm), calcium (74 mg/L), magnesium (8.6 mg/L), sodium (9.4 mg/L), sulfate (200 mg/L), phosphorous (0.16 mg/L), and total dissolved solids (356 mg/L).

Construction of the Stage 1 Closure Cap occurred during the summer of 2023 and may have contributed to increased disturbance of area soils and the consequent increase in parameter values in the stormwater in Detention Pond 6. The parameter values at SW-DP6 returned to values that were more consistent with typical values at this location in October 2023.

With the exception of the greater parameter values discussed above at SW-DP6 in July 2023, the key indicator parameter values for SW-DP1 and SW-DP6 remain very low in comparison to JRL leachate (see Table 8-8).

The iron concentration at SW-DP1 exceeded the MFCCC standard of 1 mg/L during only the July 2023 monitoring event with a concentration of 8.5 mg/L. MFCCC exceedances for iron have occurred historically at this location. There were no other MFCCC exceedances at SW-DP1 for parameters analyzed during 2023. There were no MFCCC exceedances at SW-DP6 for parameters analyzed during 2023.

There were not multiple parameters (i.e., four or more) with statistically significant increasing or decreasing trends at SW-DP1 and SW-DP6 over the past three years and five years.

Pore-Water Monitoring Locations: Pore-water sample locations PWS10-1, PWS10-2, and PWS10-3, which are located along the landfill side of the bank of the southwesterly unnamed tributary to Pushaw Stream, have been sampled since 2010. These sampling locations are intended to be representative of

groundwater quality as it discharges to the stream. Due to their local hydrologic setting (i.e., shallow fluctuating water table with high natural organic matter associated with the wetland and stream), they are characterized by iron and total organic carbon concentrations that are typically greater than in groundwater from other areas of the site. Groundwater quality has been generally consistent at all three pore-water sampling locations since sampling began at these locations in 2010 and does not indicate influences from landfill leachate or landfill operations.

While visual review of the 2023 and historical pore-water quality data indicates generally stable water quality, there were one or more parameter concentrations at PWS10-1, PWS10-2, and PWS10-3 that were outside of the range of historical minimum and maximum values for these monitoring locations in 2023. These occurrences are identified on the individual water quality summary sheets contained in Appendix E.

There were not multiple parameters (i.e., four or more) at PWS10-1, PWS10-2, and PWS10-3 with statistically significant decreasing or increasing trends over the past three years and five years.

Pore-water sampling location PWS-4 was added to the site monitoring program in 2023 to monitor the water in the overburden adjacent to the northerly unnamed tributary to Pushaw Stream. The 2023 pore-water samples from PWS-4 had water quality that was very similar to the pore-water quality at PWS10-1, PWS10-2, and PWS10-3.

The key indicator parameter values for PWS10-1, PWS10-2, PWS10-3, and PWS-4 remain very low in comparison to JRL leachate (see Table 8-8).

Pore-water samples from PWS10-1, PWS10-2, and PWS10-3 were analyzed for dissolved methane during the April, July, and October 2023 monitoring events, as recommended by the MEDEP. Pore-water samples from PWS-4 were also analyzed for dissolved methane in March, April, June, July, and October 2023 as part of the baseline monitoring for that location and as specified in the detection monitoring program for that location. The dissolved methane concentrations for these pore-water samples in 2023 are provided in Table 8-9.

TABLE 8-9

2023 DISSOLVED METHANE CONCENTRATIONS AT PORE-WATER MONITORING LOCATIONS

Location Designation	March 2023 (µg/L)	April 2023 (µg/L)	June 2023 (µg/L)	July 2023 (µg/L)	October 2023 (µg/L)
PWS10-1	–	160	–	120	720
PWS10-2	–	20 U	–	100	99
PWS10-3	–	20 U	–	220	20 U
PWS-4	20 U	26	62	33	55

Notes:
U – not detected above the indicated laboratory reporting limit

The 2023 dissolved methane concentrations are lower than the historical maximum concentrations detected at PWS10-1 (4,600 µg/L in July 2015), PWS10-2 (4,800 µg/L in July 2022), and PWS10-3 (4,000 µg/L in July 2020). The 2023 dissolved methane concentrations at PWS-4, which was added to the monitoring program in 2023, were well below the historical maximum concentrations observed at PWS10-1, PWS10-2, and PWS10-3. The historical dissolved methane detections at these locations are consistent with their hydrologic setting in a freshwater wetland and are attributed to anaerobic biological processes in the saturated wetland soils. Studies of freshwater wetlands in the southeastern portion of the United States show wetland pore-water samples with dissolved methane concentrations of more than 20,000 µg/L in the top 25 centimeters of saturated soils[19]. The lower dissolved methane concentrations at JRL wetlands are likely attributed to the cooler climate in the northeastern portion of the United States, which limits anaerobic biological activity. The historical dissolved methane results at the pore-water monitoring locations typically indicate substantially greater concentrations during the summer monitoring event when warmer temperatures facilitate increased anaerobic biological processes in the saturated wetland soils.

While the pore-water sampling locations are grouped with surface water and stormwater monitoring locations, the samples are obtained from soil and the sampling results from these locations are compared to MCL, LHA, and DWA standards for groundwater. The exceedances for parameters analyzed during 2023 at the pore-water monitoring locations are summarized as follows:

- Manganese was above its LHA of 0.3 mg/L in 2023 at PWS10-1 (0.39 mg/L in April 2023, 4.8 mg/L in July 2023, and 0.76 mg/L in October 2023);
- Manganese was above its LHA of 0.3 mg/L in 2023 at PWS10-2 (0.32 mg/L in April 2023 and 0.42 mg/L in July 2023);
- Manganese was above its LHA of 0.3 mg/L in 2023 at PWS10-3 (1.5 mg/L in July 2023);

[19] Schipper LA, Reddy KR (1994) Methane production and emissions from four reclaimed and pristine wetlands of southeastern U.S. *Soil Science Society of America Journal* 58, 1270-1275.

- Manganese was above its LHA of 0.3 mg/L in 2023 at PWS-4 (0.83 mg/L in March 2023, 1.0 mg/L in April 2023, 2.1 mg/L in June 2023, and 0.35 mg/L in October 2023; and
- Arsenic was above its MCL of 0.01 mg/L in 2023 at PWS-4 (0.011 mg/L in April 2023).

8.5 Leak Detection System

The approved permitted landfill expansion liner system for Cell 11 through Cell 17 includes leak detection layers under the primary liner systems. The 2015 Liner Action Plan (LAP) describes the methods to monitor the performance of the primary liner system of Cell 11 through Cell 17 and outlines response actions should action levels be exceeded in the leak detection layer. The LAP uses a calculated Leak Detection System Action Level (LDSAL) to determine the need for additional actions. The LDSAL formula is based on the flow measured in the leak detection layer and the specific conductance measured in the leachate and leak detection layers. The LDSAL is compared to the leak detection specific conductance that is measured each month. If the LDSAL is equal to or greater than the leak detection specific conductance, no further action is needed. The Cell 11, Cell 12, Cell 13, and Cell 14 leak detection systems were monitored throughout 2023 in accordance with the LAP and there were no LDSAL exceedances. Monitoring for the Cell 15 leak detection system began in July 2023 in accordance with the LAP and there were no LDSAL exceedances.

Detection monitoring began in 2021 at landfill leak detection sampling locations LF-LD-11 and LF-LD-12 for the Cell 11 and Cell 12 leak detection systems, respectively. Detection monitoring began in 2022 at landfill leak detection sampling location LF-LD-13 for the Cell 13 leak detection system. Detection monitoring began in 2023 at landfill leak detection sampling location LF-LD-14 for the Cell 14 leak detection system. Detection monitoring for landfill leak detection sampling location LF-LD-15 for the Cell 15 leak detection system will begin in 2024. The LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 monitoring locations are shown on Figure 3-1. The samples are collected from the leak detection sample sump which is accessible from the pump stations. Leak detection monitoring was conducted during the July 2023 monitoring event for parameters in the detection monitoring program. A summary of the 2023 leak detection annual maximum values for key indicator parameters for comparison to the JRL leachate is provided in Table 8-10.

TABLE 8-10

2023 ANNUAL MAXIMUM SPECIFIC CONDUCTANCE VALUES AND CHLORIDE AND ARSENIC CONCENTRATIONS AT LEAK DETECTION MONITORING LOCATIONS

Leak Detection Monitoring Location	Annual Maximum Specific Conductance (20,000 µmhos/cm in JRL Leachate in April 2023)	Annual Maximum Chloride (5,000 mg/L in JRL Leachate in April and July 2023)	Annual Maximum Arsenic (0.43 mg/L in JRL Leachate in July 2023)
LF-LD-11	1,275 (August 2023)	2.9 (July 2023)	0.005 U (July 2023)
LF-LD-12	1,410 (November 2023)	1.0 U (July 2023)	0.005 U (July 2023)
LF-LD-13	557 (August 2023)	2.2 (July 2023)	0.005 U (July 2023)
LF-LD-14	803 (August 2023)	2.2 (July 2023)	0.005 U (July 2023)
LF-LD-15	796 (October 2023)	NS	NS

Notes:
U – not detected above the indicated laboratory reporting limit
NS – not sampled

Based on the very low chloride and arsenic concentrations at LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 during 2023, the liquid sampled from those locations does not indicate the presence of leachate in the leak detection systems. The specific conductance at LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 had annual maximum values that are greater than those typical at upgradient monitoring locations. This is likely the result of the recent construction of Cell 11, Cell 12, Cell 13, Cell 14, and Cell 15.

Samples from the LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 were analyzed for dissolved methane during the July 2023 monitoring event. Dissolved methane was not detected at or above the laboratory reporting limit of 20 µg/L at LF-LD-11. Dissolved methane was detected at concentrations of 240 µg/L at LF-LD-12 and 39 µg/L at LF-LD-13, which were values consistent with the historical dissolved methane detections at those locations. Dissolved methane was detected at a concentration of 79 µg/L at LF-LD-14 in July 2023, which was the first time that this well was sampled for detection monitoring parameters. LF-LD-15 will be sampled for the detection monitoring parameters beginning in the summer 2024 monitoring round.

9.0 WATER QUALITY GAS MONITORING

During the spring, summer, and fall monitoring events in 2023, methane gas, hydrogen sulfide, and oxygen were measured during the collection of water quality samples at the site monitoring well standpipes, underdrain outfalls, leachate collection system, Detention Pond 1A leak detection system using a hand-held gas meter. All methane and hydrogen sulfide monitoring results were below the meter detection limit. Historical and 2023 gas monitoring results for the site are included in Appendix H.

Hydrogen sulfide is monitored automatically near the JRL site property boundaries in four locations. The data is logged every 15 minutes and is available from NEWSME upon request.

10.0 SUMMARY AND RECOMMENDATIONS

10.1 Summary

Water quality samples were obtained in April, July, and October 2023 at the JRL in accordance with the current site EMP. The 2023 water quality data for the JRL is consistent with the historical data for the site and with the setting of monitoring locations among the construction and operational activities of the landfill. Site groundwater and surface water quality data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems. The evaluation of site water quality, which incorporates the 2023 water quality data, identifies trends at multiple locations and for a number of parameters, both upgradient and downgradient from the landfill. Historical groundwater quality data through 2023 indicate that these trends are largely attributable to a reduction in recharge due to the landfill placement in the landscape and subsequent changes in redox conditions, as well as changes due to the construction of the landfill (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate any significant landfill related impacts to water quality from malfunction of the landfill liners. The JRL site-wide water quality are summarized below.

Leachate Monitoring Location

As discussed in Section 8.1, leachate parameter values from monitoring location LT-C4LR during 2023 and historically since July 2013 are generally characterized by high parameter values. Generally, at a given water quality monitoring location, if landfill leachate were present, there would be a notable, significant increase in specific conductance values and chloride and arsenic concentrations (in conjunction with changes in other parameter concentrations) due to their presence at high concentrations in the JRL leachate. In 2023, the annual maximum values in JRL leachate (i.e., monitoring location LT-C4LR) are a specific conductance value of 20,000 µmhos/cm, 19,380 mg/L of chloride, and 0.43 mg/L of arsenic.

Underdrain Monitoring Locations

As discussed in Section 8.2, there was no flow at LF-UD-1, LF-UD-2, LF-UD-3A,B, LF-UD-4, LF-UD-6, LF-UD-7, LF-UD-8, LF-UD-9, LF-UD-10, and LP-UD-1 during any of the three 2023 detection monitoring events; thus, no samples were obtained at these locations during 2023. These occurrences of no flow at these underdrain monitoring locations are generally consistent with previously observed patterns and is likely associated with the lowering of the groundwater table from the construction of the landfill expansion cells (see Section 2.0).

Where there was flow during 2023 from underdrain monitoring locations (LF-UD-4, LF-UD-5 and 6, LF-UD-12+13+14, and LP-UD-2), the underdrain monitoring data do not show adverse effects from the performance of the landfill cells or leachate collection and transport systems.

VOCs were analyzed at all sampled underdrain locations (both landfill and Detention Pond 1A underdrains) in April 2023; no VOCs were detected above laboratory reporting limits.

Groundwater Monitoring Locations

As discussed in Section 8.3, SME has identified 31 of the 50 site-wide groundwater monitoring locations with water quality that: (1) do not indicate influence from landfill leachate; and (2) show limited influence from landfill construction operations (see Table 8-4). These wells have 2023 annual maximum specific conductance values ranging from 56 µmhos/cm to 372 µmhos/cm, and low chloride concentrations ranging from 1.3 mg/L to 19 mg/L. Many of these wells also generally exhibit limited to no statistically significant increasing trends.

More pronounced water quality changes have been observed at 19 of the site groundwater monitoring locations (see Table 8-4), which include wells both upgradient and downgradient from the landfill. These changes are evidenced at some monitoring locations by the statistically significant trends for multiple parameters. These trends are largely attributable to changes in redox conditions, which occur as expected around the landfill due to the placement of the landfill in the landscape and from construction activities (e.g., from removal of vegetation, disturbance of native soils, and the cutoff of precipitation in the landfill area), and do not indicate landfill related impacts to water quality from malfunction of the landfill liners. This conclusion is supported by the current values and trends of key indicator parameters at the landfill underdrain monitoring locations and leak detection monitoring locations.

Upgradient monitoring location MW12-303R is located in an area that historically has been influenced by roadway maintenance and runoff, and from site construction activities, with improvements and corrections implemented as discussed in previous reports. T Good roadway maintenance practices and prohibiting the stockpiling of snow in the vicinity of MW12-303R will help to minimize potential impacts to water quality from landfill operations.

Stiff and Piper diagrams were plotted using July 2023 data from the landfill leachate and the 19 groundwater monitoring wells discussed in this report for having more pronounced water quality changes (see Appendix G). These diagrams generally show similar chemical characterizations among the groundwater monitoring wells in July 2023 and a clear distinction from the chemical signature of the leachate from LT-C4LR in July 2023 (see Appendix G). We do not interpret any of the recent water quality data or noted trends at any of the downgradient monitoring wells to be related to the performance of landfill cells or leachate collection and transport systems. Some parameter concentrations at some monitoring locations downgradient of the landfill expansion show effects from the recent construction activities that are expected to decrease and stabilize with additional time following the construction of the landfill expansion cells.

Surface Water, Stormwater, and Pore-Water Monitoring Locations

As discussed in Section 8.4, the 2023 surface water, stormwater, and pore-water monitoring location data are generally characterized by very low values of key indicator parameters by comparison to the JRL leachate (i.e., LT-C4LR). This is generally consistent with historical data at these locations.

Dissolved Methane Monitoring

Dissolved methane monitoring at groundwater monitoring wells, pore-water samples, and leak detection monitoring locations are discussed in Sections 8.3, 8,4, and 8.5. Of the thirty-two groundwater monitoring wells from which samples were obtained for dissolved methane analysis in 2023, the parameter was only detected at low concentrations above laboratory reporting limit of 20 µg/L at three locations during the July monitoring event and one location during the October monitoring event.

Dissolved methane was detected during July of 2023 in three leak detection monitoring locations.

The dissolved methane detections in 2023 pore-water monitoring are consistent with their hydrologic setting in a freshwater wetland and are attributed to anaerobic biological processes in the saturated wetland soils, including higher concentrations during the summer monitoring event when warmer temperatures facilitate increased anaerobic biological processes in the saturated wetland soils.

Leak Detection Monitoring Locations

Landfill leak detection locations LF-LD-11, LF-LD-12, LF-LD-13, and LF-LD-14 were monitored in 2023 as discussed in Section 8.5. Sampling results show very low chloride concentrations and no arsenic detections during 2023. The 2023 leak detection monitoring results do not indicate the presence of leachate in the leak detection systems for Cells 11 through 14. The specific conductance values at these leak detection locations in 2023 were greater than those typical at upgradient monitoring locations, which is likely the result of the material settling in the leak detection system, and can be expected to continue and increase over time. Specific conductance and liquid flow rates in the leak detection systems were below the action levels defined in the LAR Plan.

10.2 Closure and Recommendations

- SME recommends that on-site snow removal and winter roadway maintenance practices minimize stockpiling of snow around monitoring locations proximate to roadways.
- SME recommends continuing with the current site monitoring program in 2024.

DATA SUMMARY TABLE

Conductivity and Water Levels

SEVEE & MAHER ENGINEERS, INC.
4 BLANCHARD ROAD
CUMBERLAND CENTER, ME 04021

(P-220B) Date	Specific Conductance µmhos/cm @25°C	Water Level Depth Feet	Water Level Elevation Feet	Well Depth Feet

Notes: TYPE - Sample Type Qualifier where D = Duplicate Sample.

Concentration Qualifier Notes:

- ! - The sampling location was damaged or destroyed.
- A - The sampling location was inaccessible.
- A6 - Approximate value.
- D - The sampling location was dry.
- F1 - Well was flowing
- F12 - Pipe under water, no sample taken.
- F21 - Area flooded by water. Beaver dam in area.
- F5 - Water level not high enough to pump.
- Q - An obstruction prevented the collection of data.

CUMBERLAND CENTER, ME 04021

(SW-DP6)			Specific Conductance	pH	Temperature	Water Level Elevation	Water Level Depth	Well Depth	Water Level Reference Point	Eh	Dissolved Oxygen	Alkalinity (CaCO3) (field)	Turbidity (field)	Flow Rate
Date	Type	Sample ID	µmhos/cm @25°C	STU	Deg C	Feet	Feet	Feet	Feet	mV	mg/L	mg/L	NTU	cfs

Units Abbreviations:

µmhos/cm @25°C - MICROSIEMENS PER CENTIMETER
cfs - CUBIC FEET PER SECOND
Deg C - DEGREES CELCIUS (TEMPERATURE)
Feet - FEET
mg/L - MILLIGRAMS PER LITER
mV - MILLIVOLTS
NTU - NEPHELOMETRIC TURBIDITY UNIT (TURBIDITY)
STU - STANDARD PH UNIT

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
< - Less than specified amount
> - Greater than specified amount.
A - The sampling location was inaccessible.
D - The sampling location was dry.
D3 - Sample too dark to take reading.
DE - Decommissioned Location
E2 - Estimated Field Value
F - The sampling location was frozen.
F1 - Well was flowing
F12 - Pipe under water, no sample taken.
F14 - Unable to measure flow.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
FI - Frozen ice in pipe, no readings.
H2 - Waterlevel higher than pipes. See LF-COMP for readings
H5 - Waterlevel higher than pipes. See LP-COMP for readings
H6 - Pipe under water, could not measure flow.
H8 - No flow from pipe. See LF-COMP for readings
H9 - No flow from pipe. See LP-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
L - Could not locate sampling location.

SEVEE & MAHER ENGINEERS, INC.
4 BLANCHARD ROAD
CUMBERLAND CENTER, ME 04021

(SW-DP6)

Date	Type	Sample ID	Specific Conductance	pH	Temperature	Water Level Elevation	Water Level Depth	Well Depth	Water Level Reference Point	Eh	Dissolved Oxygen	Alkalinity (CaCO3) (field)	Turbidity (field)	Flow Rate
			µmhos/cm @25°C	STU	Deg C	Feet	Feet	Feet	Feet	mV	mg/L	mg/L	NTU	cfs

M - Results are missing or not reliable due to a meter malfunction.
M7 - No reading taken at this location.
TK - Outside of range of available test kits (or below test kit range).
U - Not Detected above the laboratory reporting limit.

DATA SUMMARY TABLE

Inorganics Parameters

SEVEE & MAHER ENGINEERS, INC.
4 BLANCHARD ROAD
CUMBERLAND CENTER, ME 04021

(SW-DP6)			Total Kjeldahl Nitrogen	Ammonia (N)	Nitrite/Nitrate - (N)	Total Phosphorus	Total Dissolved Solids	Total Suspended Solids	Sulfate	Sulfide	Bicarbonate Alkalinity (CaCO3)	Alkalinity (CaCO3)	Organic Carbon	Biochemical Oxygen Demand	Chloride	Bromide
Date	Type	Sample ID	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L

Units Abbreviations:

mg/L - MILLIGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
* - Analysis not within control limits
A - The sampling location was inaccessible.
D - The sampling location was dry.
DE - Decommissioned Location
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H - Analyzed outside U.S.EPA's recommended hold time.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
J - Analyte was positively identified/Associated value is an estimate.
M10 - Due to a identified laboratory instrumentation malfunction, this analytical result is likely elevated–the laboratory has fixed the issue.
U - Not Detected above the laboratory reporting limit.
UH - Not Detected above the laboratory reporting limit. Analyzed outside U.S.EPA's recommended hold time

DATA SUMMARY TABLE

Metals Parameters

SEVEE & MAHER ENGINEERS, INC.
4 BLANCHARD ROAD
CUMBERLAND CENTER, ME 04021

(SW-DP6)	Filtration	Arsenic	Calcium	Copper	Iron	Magnesium	Manganese	Potassium	Sodium	Boron
	-	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L	mg/L
Date Type Sample ID										

Units Abbreviations:

- -

mg/L - MILLIGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
A - The sampling location was inaccessible.
D - The sampling location was dry.
DE - Decommissioned Location
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Sample collection notes:

FILT - One or more analytical parameters were field filtered.
UF - No analytical parameters were field filtered.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

A - The sampling location was inaccessible.
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

A - The sampling location was inaccessible.
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

A - The sampling location was inaccessible.
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

A - The sampling location was inaccessible.
F - The sampling location was frozen.
F12 - Pipe under water, no sample taken.
F16 - Could not pump water to surface for testing/sampling
F6 - No flow. Sample not taken.
H8 - No flow from pipe. See LF-COMP for readings
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

! - The sampling location was damaged or destroyed.
A - The sampling location was inaccessible.
D - The sampling location was dry.
F - The sampling location was frozen.
F16 - Could not pump water to surface for testing/sampling
I - The sampling location yielded insufficient quantity to collect a sample.
U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

mg/L - MILLIGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample

Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

M10 - Due to a identified laboratory instrumentation malfunction, this analytical result is likely elevated–the laboratory has fixed the issue.

U - Not Detected above the laboratory reporting limit.

Units Abbreviations:

ug/L - MICROGRAMS PER LITER

Notes: Sample Type XX = Environmental Sample, XD = Duplicate Sample
Blank Cells appear when a parameter was not analyzed.

Concentration Qualifier Notes:

U - Not Detected above the laboratory reporting limit.

REPORT PREPARED: 12/27/2023 14:41
FOR: Juniper Ridge Landfill
DATE RANGE: 1/1/2014 - 12/31/2023

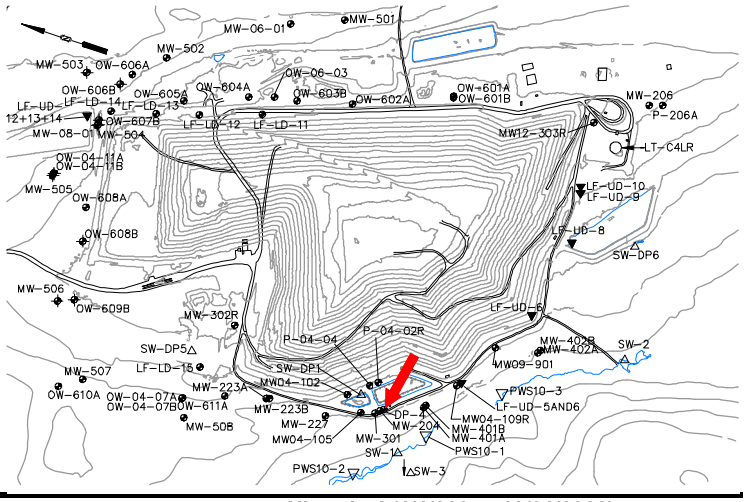
APPENDIX E

2023 WATER QUALITY SUMMARY REPORTS AND DATA PLOTS

SME
SEVEE & MAHER ENGINEERS

Well Description

DP-4 is located downgradient of the landfill and former leachate pond and monitors groundwater quality within the overburden.



Screen Interval:	**18.5 ft. to 24.5 ft.**
Sampled:	**1 Time Annually(field parameters only)**
Sampled Since:	**01/30/04**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Chemical Summary

	2023				Historical (1/1/2004 - 12/31/2022)			
Indicator Parameters	Q1	Q2	Q3	Q4	Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)				184	100	to 965	330 ±	21.000	40
pH (STU)				5.9	5.6	to 7.3	6.5 ±	0.058	40
Temperature (Deg C)				14.3	6	to 23.9	13 ±	0.600	40
Water Level Depth (Feet)				16.65	13.25	to 17.19	15 ±	0.130	40
Water Level Elevation (Feet)				152.72	152.18	to 156.12	150 ±	0.130	40
Water Level Reference Point (Feet)				169.37	169.37	to 169.37	170 ±	0.000	40
Eh (mV)				253	-51	to 352	240 ±	13.000	39
Dissolved Oxygen (mg/L)				0.4	0.4	to 6	1.7 ±	0.250	40
Well Depth (Feet)				27.12	22.17	to 27.16	27 ±	0.270	18
Turbidity (field) (NTU)				10.5	0.6	to 36.2	8.4 ±	1.200	40

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Chemical Summary

Indicator Parameters	2023 Q1	Q2	Q3	Q4	Historical (1/1/2004 - 12/31/2022) Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)	393	395	490	450	101	to 504	370	± 7.300	111
pH (STU)	7.8	7.7	7.8	7.2	6.7	to 8.4	7.4	± 0.039	111
Temperature (Deg C)	9	16.8	24.1	22.3	3.2	to 29.7	17	± 0.490	111
Eh (mV)	389	346	344	359	293	to 446	370	± 3.000	111
Dissolved Oxygen (mg/L)	6	6	6	6	4	to 10	6.9	± 0.130	109
Alkalinity (CaCO3) (field) (mg/L)	175	150	225	250	55	to 325	170	± 4.600	110
Turbidity (field) (NTU)	7	58.7	9.6	6.1	0	to 625.23	14	± 6.000	110

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

During times when LF-UD-1, LF-UD-2, LF-UD-3A & B, LF-UD-4, and LF-UD-7 have not been able to be sampled seperately due to pipe submergence, LF-COMP has been collected from manhole #5. Field parameters are measured at this location during some monthly monitoring rounds by NEWSME.

Q1= 1 - 2023
Q2= 4 - 2023
Q3= 7 - 2023

Juniper Ridge Landfill

Well Description

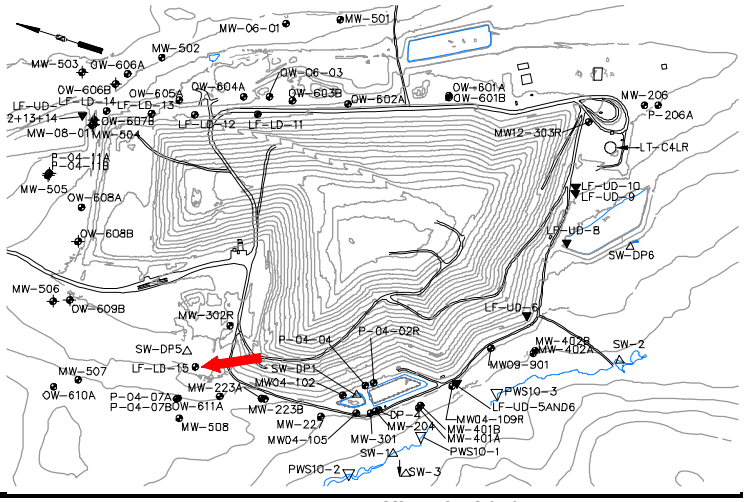
LF-LD-15 monitors the leak detection system for Cell 15 from the Cell 15 leak detection pump station.



Screen Interval:

Sampled: **Annually in summer***

Sampled Since: **7/18/2023**

Material Screened:

Well Condition:

Sampling Method: **Grab**

Chemical Summary

Indicator Parameters	2023 Q1	Q2	Q3	Q4	Historical (-) Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)			605	761	No historical data for Specific Conductance.				
pH (STU)			7.8	7.7	No historical data for pH.				
Temperature (Deg C)			25.3	23.9	No historical data for Temperature.				
Eh (mV)			353	87	No historical data for Eh.				
Dissolved Oxygen (mg/L)			6	6	No historical data for Dissolved Oxygen.				
Flow Rate (cfs)				0.0145	No historical data for Flow Rate.				
Alkalinity (CaCO3) (field) (mg/L)			160	250	No historical data for Alkalinity (CaCO3) (field).				
Turbidity (field) (NTU)			22.9	9	No historical data for Turbidity (field).				

underlined/bold - values exceed a regulatory standard listed below.

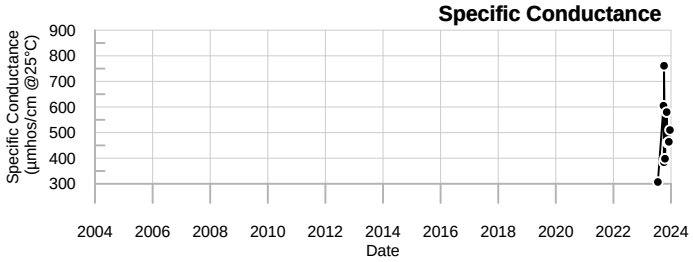
Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

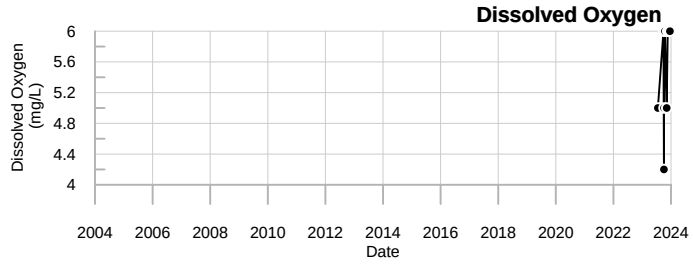
Comments

*Field parameters measured monthly by NEWSME.

Q3= 7 - 2023
Q4= 10 - 2023



No Data Found for Sodium



No Data Found for Bromide

No Data Found for Calcium

No Data Found for Total Dissolved Solids

No Data Found for Iron

No Data Found for Sulfate

No Data Found for Magnesium

No Data Found for Organic Carbon

No Data Found for Manganese

No Data Found for Chloride

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Juniper Ridge Landfill

MW04-109 & MW04-109R

Well Description

MW04-109R is located to the south of Cell #5 of the landfill and near Manhole #5. This well monitors water quality within the overburden downgradient of the landfill.

Screen Interval:	**15 ft. to 20 ft.**
Sampled:	**3 Times Annually**
Sampled Since:	**12/08/2009**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

MW09-901
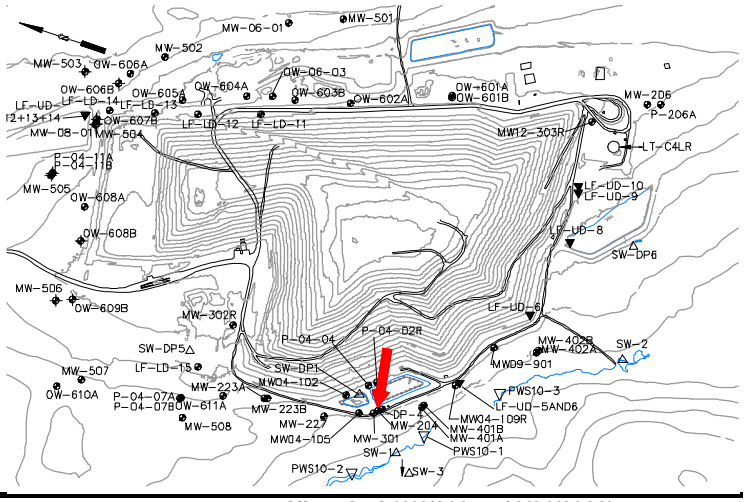
Juniper Ridge Landfill

Well Description

MW-204 monitors the overburden water quality downgradient from the landfill.



Screen Interval:	**13.8 ft. to 18.8 ft.**
Sampled:	**1 Time Annually(field parameters only)**
Sampled Since:	**11/13/90**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Chemical Summary

Indicator Parameters	2023 Q1	Q2	Q3	Q4	Historical (1/1/2004 - 12/31/2022) Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)				!	160	to 357	230 ±	8.000	40
pH (STU)				!	5.7	to 7.5	6.7 ±	0.058	40
Temperature (Deg C)				!	4.2	to 18	12 ±	0.480	40
Water Level Depth (Feet)				!	8.35	to 11.5	9.4 ±	0.093	40
Water Level Reference Point (Feet)				164.75	164.75	to 164.75	160 ±	0.000	40
Eh (mV)				!	176	to 491	310 ±	12.000	39
Dissolved Oxygen (mg/L)				!	0.3	to 5	1.2 ±	0.150	40
Flow Rate (cfs)				!	No historical data for Flow Rate.				
Well Depth (Feet)				24.47	24.4	to 24.49	24 ±	0.006	18
Turbidity (field) (NTU)				!	0	to 6.7	1.7 ±	0.260	40

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

Q4= 10 - 2023

! = The sampling location was damaged or destroyed.

Abbrev.	Type	Standard

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

MW-402A
Juniper Ridge Landfill

Well Description

MW-402B monitors water quality within the overburden downgradient of the landfill.

Screen Interval:	**12 ft. to 22 ft.**
Sampled:	**3 Times Annually**
Sampled Since:	**07/29/04**
Material Screened:	**Overburden**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

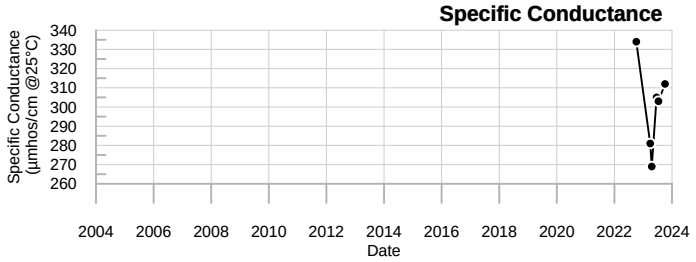
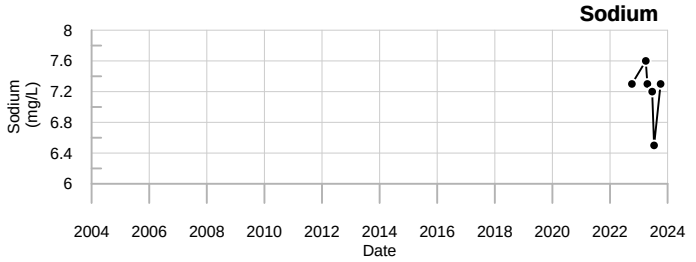
Q1= 1 - 2023
Q2= 4 - 2023
Q3= 7 - 2023
Q4= 10 - 2023

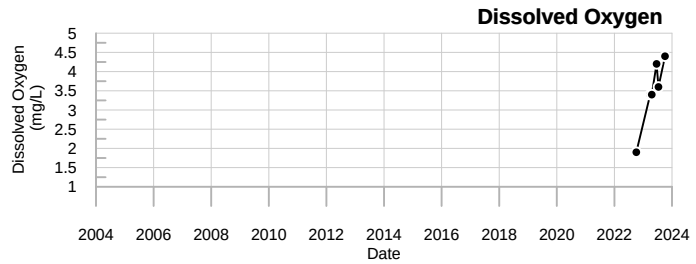
U = Not Detected above the laboratory reporting limit.

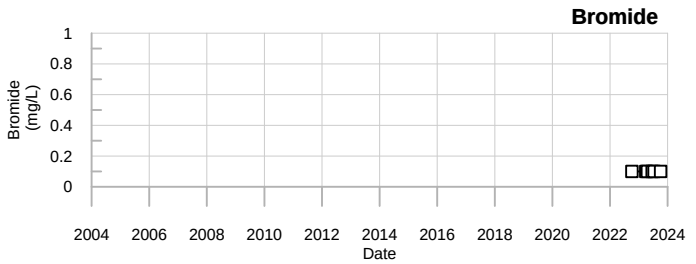
F = The sampling location was frozen.

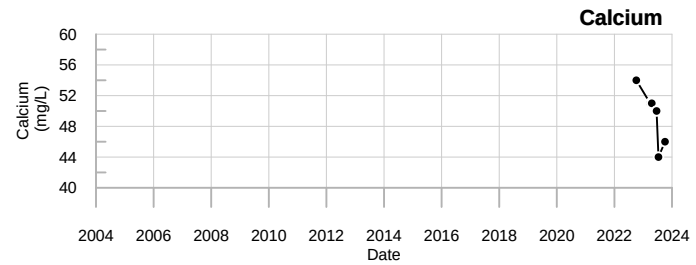
Abbrev.	Type	Standard
DWA	GW	Health-Based Drinking Water Advisory
LHA	GW	EPA Lifetime Health Advisory
MCL	GW	Maximum Contaminant Level

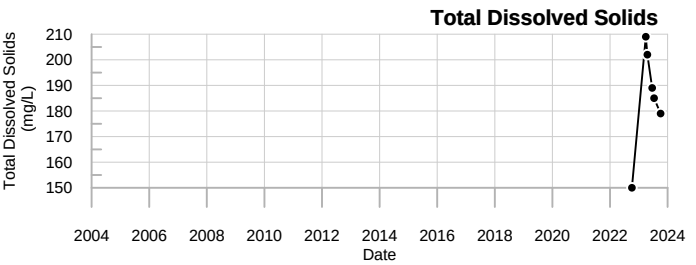


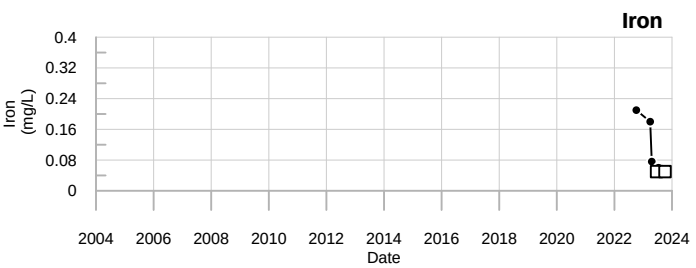


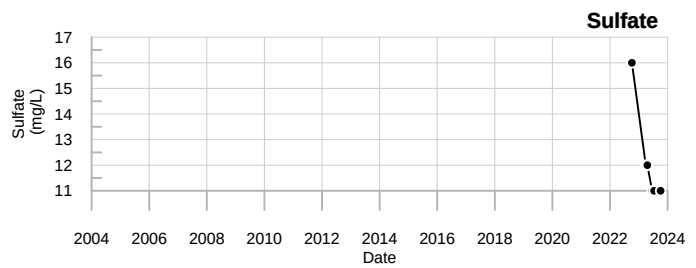


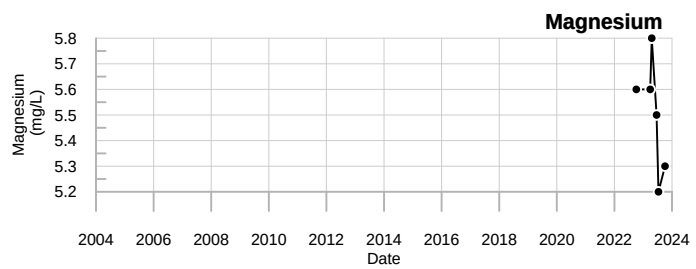


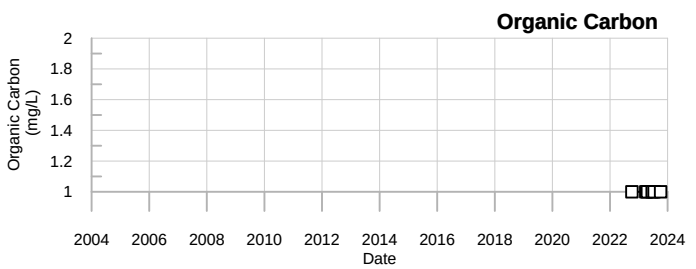


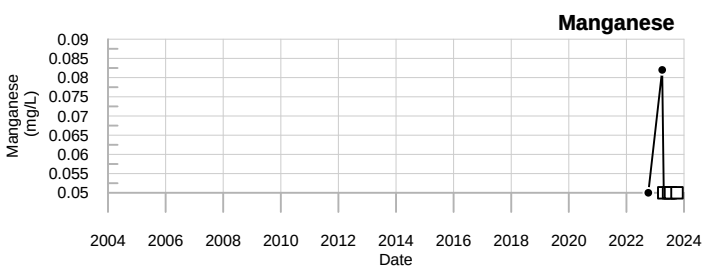


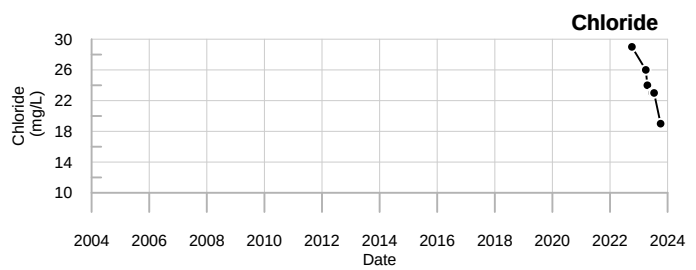












LEGEND

□ - Below reporting Limit, Associate value is the reporting limit.

◇ - Estimated Value (J-flagged).

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Juniper Ridge Landfill

Sevee & Maher Engineers, Inc.

Well Description

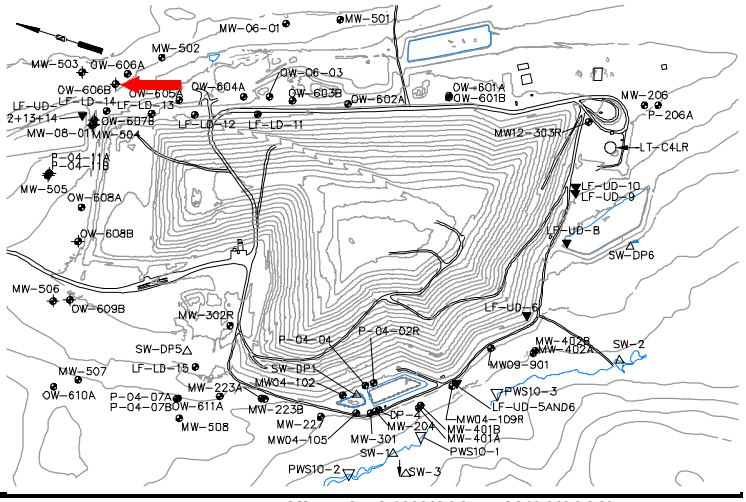
OW-606B monitors overburden/bedrock groundwater downgradient of and northwest of the landfill expansion.



Screen Interval:	**7 ft. to 12.7 ft.**
Sampled:	**3 Times Annually***
Sampled Since:	**2/9/2021**
Material Screened:	**Overburden/Bedrock**
Well Condition:	**Good**
Sampling Method:	**Low Flow**

Chemical Summary

	2023				Historical (1/1/2004 - 12/31/2022)			
Indicator Parameters	Q1	Q2	Q3	Q4	Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)		↓151	171	178	155	to 291	200	± 18.000	8
pH (STU)		7.5	↑7.8	7.7	6.9	to 7.7	7.3	± 0.100	8
Temperature (Deg C)		7	13.1	13.5	5.5	to 17.1	12	± 1.300	8
Water Level Depth (Feet)		3.44	3.6	4.02	3.03	to 4.29	3.5	± 0.160	8
Water Level Elevation (Feet)		162.436	162.276	161.856	161.586	to 162.846	160	± 0.160	8
Water Level Reference Point (Feet)		165.876	165.876	165.876	165.876	to 165.876	170	± 0.000	9
Eh (mV)		↑369	↑476	↑466	162	to 362	310	± 24.000	8
Dissolved Oxygen (mg/L)		↑10.8	↑4.9	↑4.7	1.2	to 3.9	2.8	± 0.340	8
Well Depth (Feet)				17	17	to 17	17	± 0.000	2
Arsenic (mg/L)			0.005 U		0.005 U	to 0.005 U	0.005	± 0.000	6
Calcium (mg/L)			22		19	to 28	23	± 1.200	6
Copper (mg/L)			0.003 U		0.003 U	to 0.003 U	0.003	± 0.000	6
Iron (mg/L)			0.15		0.09	to 1.4	0.5	± 0.200	6
Magnesium (mg/L)			4.8		4.2	to 5.7	5	± 0.220	6
Manganese (mg/L)			0.05 U		0.05 U	to 0.58	0.14	± 0.088	6
Potassium (mg/L)			↓1.2		1.5	to 2.1	1.7	± 0.092	6
Sodium (mg/L)			↓4.7		5.1	to 21	8.6	± 2.500	6
Boron (mg/L)			0.05 U		0.05 U	to 0.05 U	0.05	± 0.000	6
Total Kjeldahl Nitrogen (mg/L)			0.2 U		0.2 U	to 0.33	0.25	± 0.020	6
Ammonia (N) (mg/L)			0.5 U		0.5 U	to 0.5 U	0.5	± 0.000	6
Nitrite/Nitrate - (N) (mg/L)			0.12		0.05 U	to 0.12	0.093	± 0.010	6
Total Dissolved Solids (mg/L)			↓114		118	to 286	160	± 26.000	6
Total Suspended Solids (mg/L)			14		6.3	to 880	180	± 140.000	6
Sulfate (mg/L)			↓4.5		5.3	to 33	11	± 4.500	6
Sulfide (mg/L)			0.1 U		0.1 U	to 0.5 U	0.19	± 0.066	6
Alkalinity (CaCO3) (mg/L)			65		60	to 120	75	± 9.200	6
Organic Carbon (mg/L)			1 U		1 U	to 2 U	1.8	± 0.170	6
Chloride (mg/L)			↓12		14	to 18	15	± 0.560	6
Bromide (mg/L)			0.11		0.1 U	to 0.12	0.11	± 0.003	6
Turbidity (field) (NTU)		0.3	0.3	0.6	0.3	to 9.2	2.8	± 1.200	8

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Data Group: 24

Turbidity (field) (NTU)		0.4	1.8	0.7	0.4 to 8.1	3.7 ± 1.200	6

underlined/bold - values exceed a regulatory standard listed below.

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Sulfate DWA=500 mg/L, Ammonia (N) LHA=30 mg/L, Boron LHA=6 mg/L, Sodium DWA=20 mg/L, Manganese LHA=0.3 mg/L, Copper MCL=1.3 mg/L, Arsenic MCL=0.01 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Data Group: 24

Note that a value associated with a "U" qualifier is a detection or reporting limit provided by the laboratory. If a detection limit is greater than a standard, the result cannot be said to exceed the standard.

Applicable Limits:
Chloride MFCCC=230 mg/L, Ammonia (N) MFCCC=1.4 mg/L, Iron MFCCC=1 mg/L, Copper MFCCC=0.00236 mg/L, Arsenic MFCCC=0.15 mg/L

↑ indicates a value greater than the historical maximum value; ↓ indicates a value less than the historical minimum value.

Comments

Q2= 4 - 2023
Q3= 7 - 2023
Q4= 10 - 2023

U = Not Detected above the laboratory reporting limit.

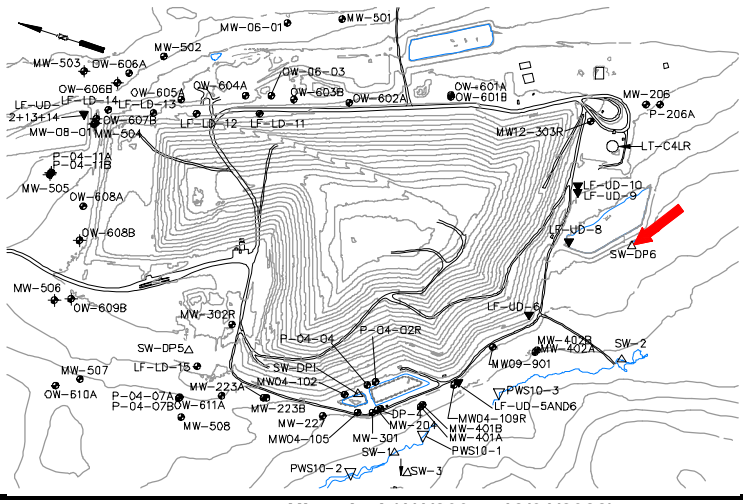
SW-DP1
Juniper Ridge Landfill

Well Description

SW-DP6 is located in Detention Pond #6, which is situated to the south of the landfill and west of the leachate storage tank.



Sampled: **3 Times Annually**

Sampled Since: **10/27/2009**

Sampling Method: **Grab**

Chemical Summary

Indicator Parameters	2023 Q1	2023 Q2	2023 Q3	2023 Q4	Historical (1/1/2004 - 12/31/2022) Min	Max	Mean	SE	n
Specific Conductance (µmhos/cm @25°C)		55	↑465	160	36	to 427	120 ±	14.000	40
pH (STU)		6.3	8.1	7	6.1	to 8.4	7.2 ±	0.094	40

Parameter Abbreviations:

Ag - Silver
Al - Aluminum
ALK - Alkalinity (CaCO3)
ALK (fld) - Alkalinity (CaCO3) (field)
As - Arsenic
Ba - Barium
Be - Beryllium
BOD5 - Biochemical Oxygen Demand
Bromide - Bromide
Ca - Calcium
Cd - Cadmium
Cl - Chloride
CN - Cyanide
Co - Cobalt
COD - Chemical Oxygen Demand
Cr - Chromium
Cu - Copper
DO - Dissolved Oxygen
Eh - Eh
Fe - Iron
Flow Rate - Flow Rate
Hard(CaMg) - Ca-mg Hardness (CaCO3)
HCO3 - Bicarbonate Alkalinity (CaCO3)
Hg - Mercury
K - Potassium
Methane - Methane
Mg - Magnesium
Mn - Manganese
MP Elev - Water Level Reference Point
Na - Sodium
NH3 - N - Ammonia (N)
Ni - Nickel
NO2/NO3 - N - Nitrite/Nitrate - (N)
NO3 - N - Nitrate (N)
OC - Organic Carbon
P - Total Phosphorus Mixed Forms (PO4 and Organic) As Phosphorus
Pb - Lead
pH - pH
S= - Sulfide
Sb - Antimony
Se - Selenium
Sn - Tin
SO4 - Sulfate
Spec Cond - Specific Conductance
TDS - Total Dissolved Solids
Temp - Temperature
TKN - Total Kjeldahl Nitrogen
Tl - Thallium
TSS - Total Suspended Solids
TURB (fld) - Turbidity (field)
V - Vanadium
Water Depth - Water Level Depth
Water Elev. - Water Level Elevation
Well Depth - Well Depth
Zn - Zinc

LOCATION	Increasing Trends	Decreasing Trends	No Trends

Calculations are performed on ProUCL Version 5.2.
Values below the detection limit are passed to ProUCL as a value of zero.
Field duplicate samples are excluded from the analysis.
Data sets with less than 3 data points are not analyzed.

Landfill Gas Monitoring Evaluation

JUNIPER RIDGE LANDFILL

2023 ANNUAL GAS MONITORING EVALUATION

Operated by NEWSME Landfill Operations, LLC

2828 Bennoch Road, Old Town, Maine 04468 • (207) 394-4372

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

1.0 INTRODUCTION

In accordance with the Maine Department of Environmental Protection (MEDEP) Chapter 401, Solid Waste Management Rules, Section 401.4.D(4)(d), an evaluation of the gas monitoring results for Juniper Ridge Landfill's (JRL) past year, including a comparison of the past year's results to the previous year's results is provided below.

Throughout 2023, the following regular landfill gas (LFG) monitoring activities occurred at JRL: (1) well-tuning of LFG collection trenches and wells (well heads), (2) continuous flow and temperature measurement at the landfill gas combustion flare, and (3) landfill gas composition measurement during well-tuning activities at the landfill gas combustion flare.

Additionally, JRL is subject to 40 Code of Federal Regulations (CFR) Part 60 Subpart XXX (the New Source Performance Standards [NSPS] for Municipal Solid Waste [MSW] landfills) and the operational standards of 40 CFR Part 63 Subpart AAAA (the National Emission Standard for Hazardous Air Pollutants [NESHAP] for MSW landfills). Reports completed in accordance with NSPS requirements are submitted separately to the MEDEP Bureau of Air Quality.

On March 26, 2020, NESHAP Subpart AAAA was updated with changes required to take effect by September 2021. JRL began complying with the changes as of the issuance date of air emission license A-921-70-H-A (1/6/2021), including the increased default LFG operating temperature limit of 145 degrees Fahrenheit (°F).

2.0 WELL FIELD ACTIVITY

During 2023, well field activities consisted of the addition of new infrastructure, as well as discontinuing older infrastructure due to malfunction, insufficient methane production or redundancy. Anomalies associated with routine operation of the well field were also monitored. A summary is provided below.

2.1 Active, New, and Discontinued Well Heads

At the beginning of 2023, the JRL well field consisted of approximately 205 active collection devices. During 2023, 1 gas collection trench, 3 vertical wells and 1 other additional odor collector were discontinued or replaced. Prior to discontinuing vertical wells, JRL first sought MEDEP approval. Prior to discontinuing gas collection trenches, which are designed as temporary collectors, JRL first notified MEDEP. Table 2-1 shows all well heads that were monitored during 2023, as well as their status as of the end of the year. By the end of 2023, approximately 254 gas collection devices remained active.

2.2 Changes and Anomalies in the Well Field

The facility was operated in accordance with NSPS requirements during the entirety of 2023. As discussed in Section 2.1, numerous collection trenches and wells were added and discontinued throughout 2023 as part of routine operations. Readings in excess of NESHAP thresholds for temperature and pressure were promptly addressed, and follow-ups were completed in accordance with NESHAP requirements. Excess readings were provided in separate reports to the MEDEP.

Due to the types of waste currently/previously disposed of at JRL (primarily construction debris, construction debris processing residuals, sludge, and ash), which tend to have higher decomposition temperatures than typical household waste, operating some of JRL's well heads according to NESHAP guidelines (with default gas temperature of 145 °F (62.8 °C)) has not always been possible. With that in mind, upon careful review by JRL staff and the MEDEP, several Higher Operating Value (HOV) allowances have been granted for temperature, up to 150 °F, to allow for proper gas collection to occur at these locations. JRL will continue to submit HOV requests as necessary to ensure continued compliance and a successful operation.

3.0 LANDFILL GAS COMPOSITION

During well-tuning activities, the composition of the landfill gas supplied to the flare was measured and concentrations of methane, carbon dioxide, and oxygen (CH_4, CO_2, O_2 respectively), and balance gas were recorded. During 2023, JRL staff operated the well field with the intent of: maintaining a target methane concentration in the range of 43%-48% (by volume) in the gas supplied to the flare, for both odor control and greenhouse gas reduction; and maintaining an oxygen concentration at satisfactory low levels (i.e. < 5%) in order to maintain high efficiency in the vacuum system and prevent possible landfill complications associated with oxygen infiltration. Balance gas levels are also monitored, as a confirmation of landfill collection efficiency and oxygen infiltration prevention. The concentration of carbon dioxide at the flare is not of great concern but is measured in addition to the more important levels of methane and oxygen.

Since gas composition is not measured daily, monthly average gas compositions at the flare were computed from routine measurements that occurred during well-tuning activities. The monthly average concentrations of methane and oxygen are shown in Figure 3-1. As can be seen, the concentration of CH_4 remained within the target range of 43%-48% for a majority of 2023. The average CH_4 concentration for 2023 was 44.5%, a 1 percent decrease from the 2022 average concentration of 44.9%. This decrease is minimal and likely attributed to minor adjustments made by the professional well tuner to control odors on-site and continue to maintain adequate gas for the future renewable natural gas project. The average oxygen concentration during 2023 was 0.6%, identical to the 2022 average also 0.6%.

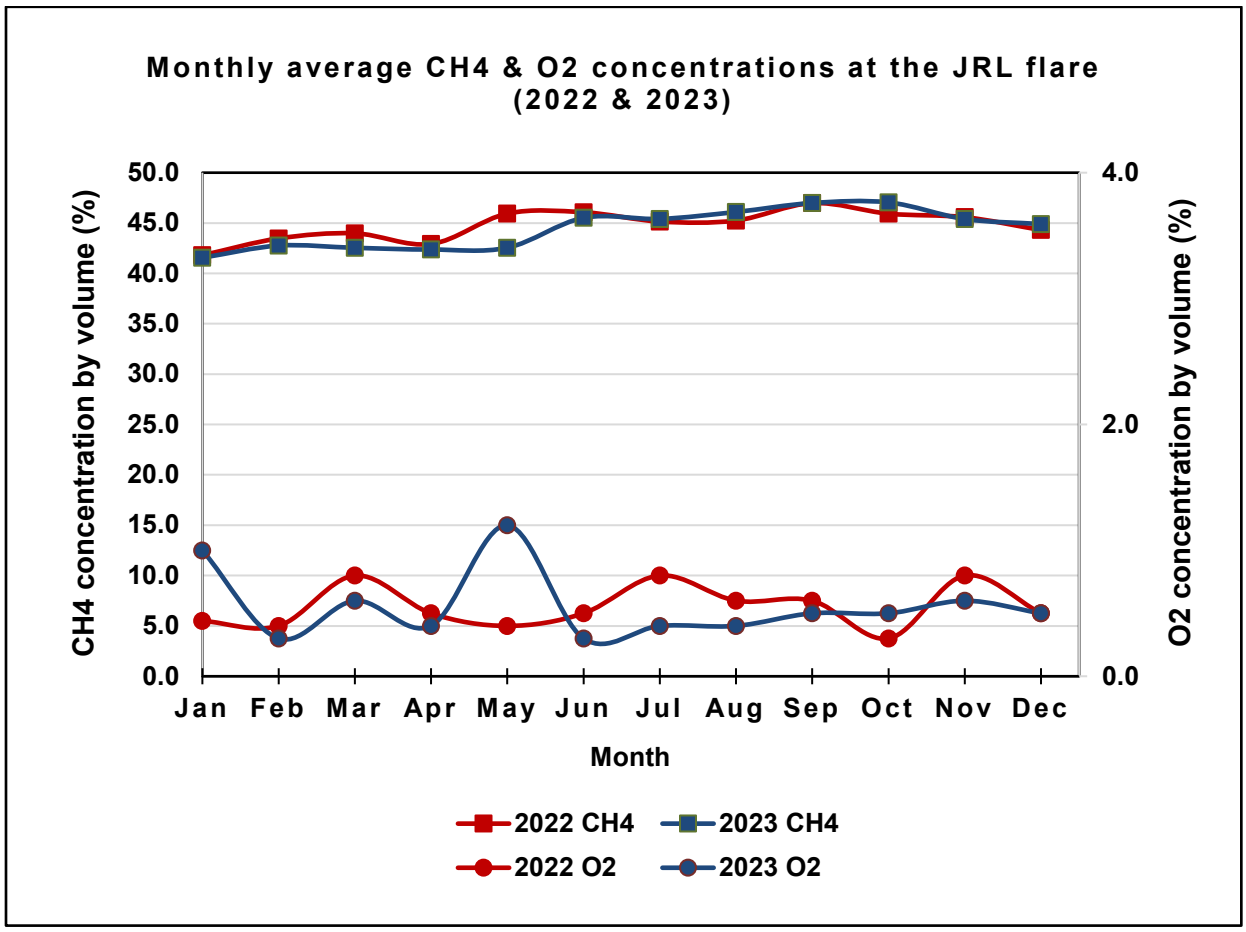

Figure 3-1 Monthly Average Landfill Gas Composition at JRL, 2022 & 2023

4.0 LANDFILL GAS FLOW

The flow of landfill gas supplied to the JRL flare and the Thiopaq® gas treatment system was measured and recorded on a continuous basis using a thermal flow meter. This data was then compiled for 2023 (and 2022 for comparison) and is summarized as total monthly flow and average flow in Table 4-1 and Figure 4-1. The average flow rate was calculated by taking the total monthly flow (in units of MMSCF)/(number of days in the month*1440 minutes/ 1 day). The result is an average flow rate (in units of SCFM) for any given month.

The total flow during 2023 was 1,430 million standard cubic feet (MMSCF), an increase of approximately 21% from the total flow of 1,179 MMSCF in 2022. This increase is likely attributed to changes in waste mix (larger amounts of Bypass MSW and Sludge), which have generated additional gas flows, an encouraging catalyst for the future renewable natural gas project schedule to come online in 2024.

Table 4-1 Volumetric Flow of Landfill Gas at JRL, 2022 & 2023

	Total Monthly Flow (MMSCF)		Monthly Average Flow Rate (SCFM)

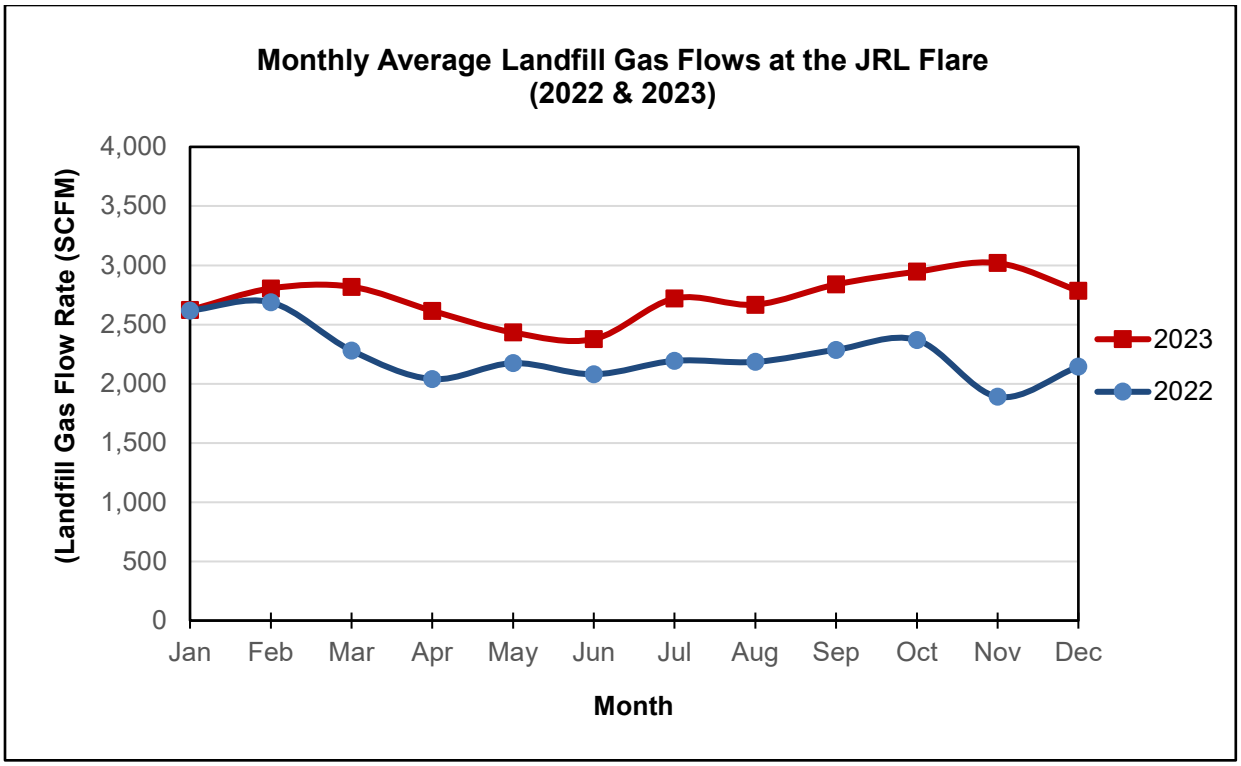

Figure 4-1 Monthly Average Landfill Gas Flow Rate at JRL, 2022 & 2023

5.0 ENERGY GENERATED BY METHANE COMBUSTION

JRL has a candlestick type flare which burns the methane (CH_4) present in the landfill gas. Methane has an approximate heating value of 1,005 BTU/SCF (BTU per standard cubic foot). Using this heating value, along with the methane concentrations and landfill gas flows presented in the previous sections, the energy generated by the combustion of methane in the JRL flare was calculated.

Table 5-1 shows the monthly totals of energy generated by CH_4 combustion, along with the average daily combustion energy for 2022 and 2023. Figures 5-1 and 5-2 further portray LFG energy combustion during its destruction through the use of the flare. The calculated total energy converted to heat by combustion at JRL during 2023 was approximately 639,124 MMBTUs, compared to approximately 530,107 MMBTUs in 2022, an increase of approximately 21%. This change is a direct result of higher gas flows combusted in 2023, which is further described in Section 4.0.

Table 5-1 Energy Generated by CH_4 Combustion at JRL, 2022 & 2023

	Monthly Total (MMBTUs)		Daily Average (MMBTUs/day)	
Month	**2022**	**2023**	**2022**	**2023**
January	49,096	48,882	1,584	1,577

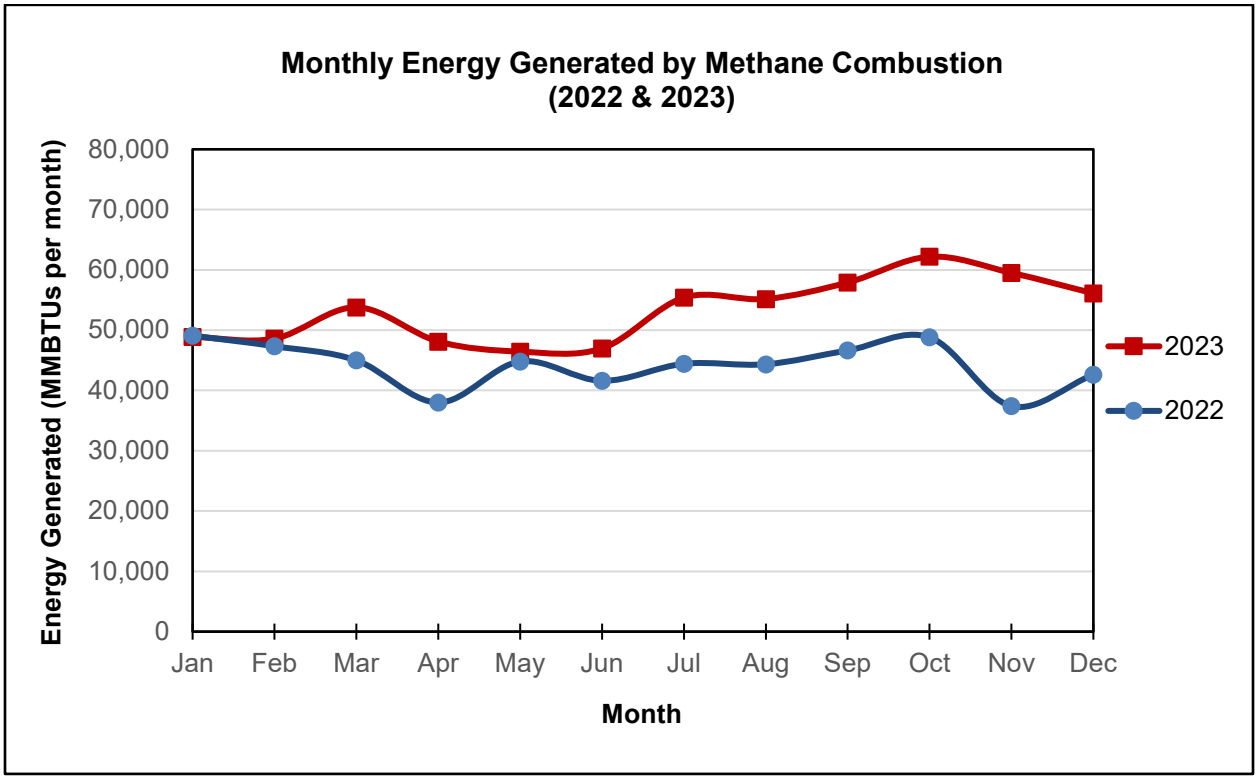

Figure 5-1 Monthly Energy Generated by CH4 Combustion at the JRL Flare, 2022 & 2023

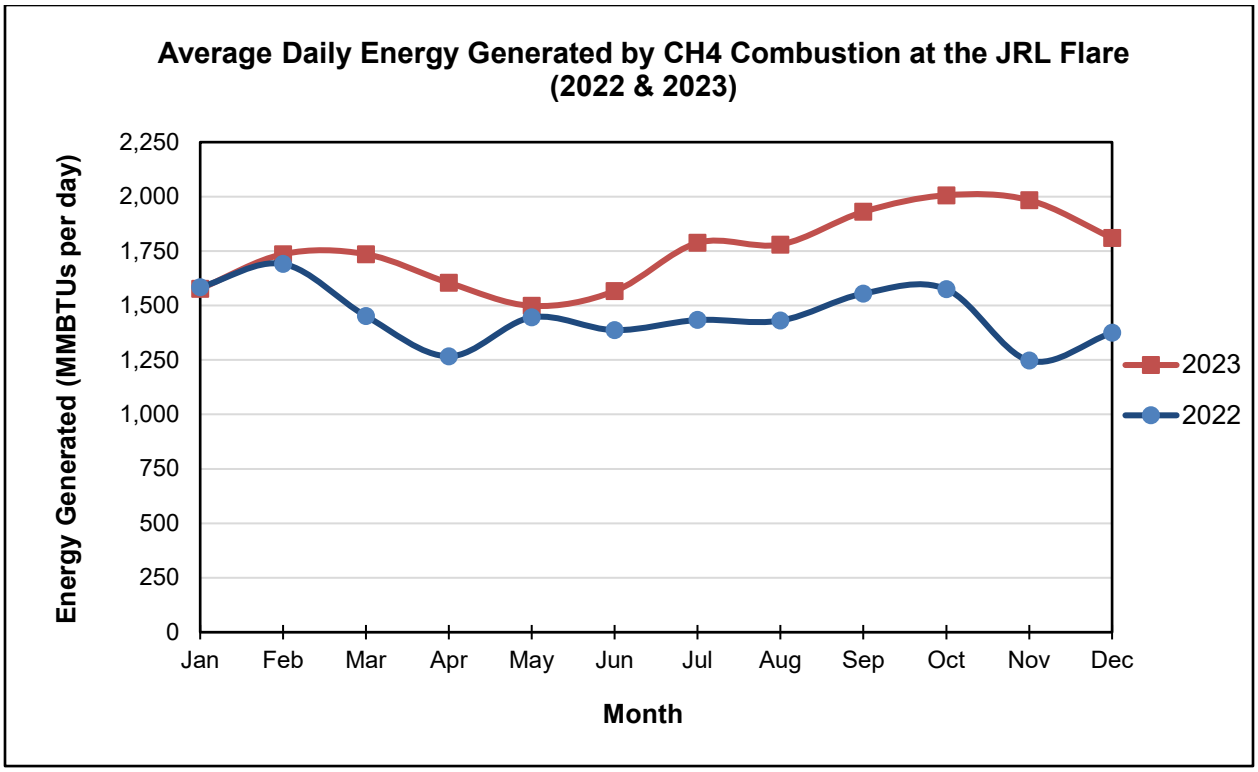

Figure 5-2 Avg. Daily Energy Generated by CH_4 Combustion at the JRL Flare, 2022 & 2023

6.0 SUMMARY

Throughout 2023, routine landfill gas (LFG) monitoring took place at JRL, in accordance with NESHAP requirements. At the beginning of 2023, the JRL well field consisted of approximately 205 active collection devices. By the end of 2023, approximately 254 gas collection devices remained active.

The average CH_4 concentration for 2023 was 44.5%, a 1 percent decrease from the 2022 average concentration of 44.9%. This decrease is minimal and likely attributed to minor adjustments made by the professional well tuner to control odors on-site and continue to maintain adequate gas for the future renewable natural gas project. The average oxygen concentration during 2023 was 0.6%, identical to the 2022 average also 0.6%.

The total flow during 2023 was 1,430 million standard cubic feet (MMSCF), an increase of approximately 21% from the total flow of 1,179 MMSCF in 2022.

The calculated total energy converted to heat by combustion at JRL during 2023 was approximately 639,124 MMBTUs, compared to approximately 530,107 MMBTUs in 2022, an increase of approximately 21%. This change is a direct result of higher gas flows combusted in 2023.

Landfill Air Monitoring Evaluation

JUNIPER RIDGE LANDFILL

2023 ANNUAL AIR MONITORING EVALUATION

Operated by NEWSME Landfill Operations, LLC

2828 Bennoch Road, Old Town, Maine 04468 • (207) 394-4372

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

1.0 INTRODUCTION

In accordance with the Maine Department of Environmental Protection (MEDEP) Chapter 401, Solid Waste Management Rules, Section 401.D(4)(e), NEWSME Landfill Operations, LLC has evaluated and summarized air monitoring results for 2023 and compared them to 2022 results. Two types of air monitoring activities occurred at the Juniper Ridge Landfill (JRL) during 2023; (1) hydrogen sulfide (H_2S) monitoring at stationary continuous monitors; and (2) quarterly methane (CH_4) emission surface scans on the landfill's intermediate cover. The air monitoring was completed in general accordance with the procedures specified in the current JRL Operations Manual.

H_2S monitors are Honeywell® Analytics MDA Single Point Monitors (SPM) utilizing EP hydrides Chemcassettes® also provided by Honeywell®. Readings were taken at 15-minute intervals and data-logged. Monitors are located at four different off-site locations surrounding the landfill as shown in Figure 1-1.

Figure 1-1 Juniper Ridge Landfill H_2S Single Point Monitoring Locations

Methane scans were completed using a Micro FID® (flame ionizing detector) or similar mobile device (QED SEM-5000) and completed once every quarter by taking measurements along an approximate 30-meter spacing grid on the intermediate cover system. Measurements were also collected at cover penetrations in the pattern (i.e., gas collection piping, etc.) and at noticeable punctures, cracks, or holes in the intermediate cover.

Additionally, odor complaints from the 24-hour JRL odor complaint hotline for 2023 were summarized and compared to 2022 results.

2.0 STATIONARY H_2S MONITORING RESULTS

Using the four Honeywell Analytics SPMs located off-site (on the Access Road, West Coiley Road, 552 West Old Town Road (Route 43), and Old Stagecoach Road), real-time data is collected and recorded at 15-minute intervals. If at any time off-site monitors detect concentrations greater than 15 parts per billion (ppb), then scale house personnel are alerted by automated telephone messages. Personnel then report any alert to supervisory staff, who are responsible for reporting H_2S readings greater than 15 ppb in the facility's Monthly Status Report and to the Old Town Code Enforcement Officer if H_2S levels exceed 30 ppb.

The Honeywell Chemcassette® tapes utilized in the SPMs at JRL are capable of continuously detecting hydrogen sulfide levels down to 2 ppb and quantitatively measuring down to 4 ppb. The quantitation limit (4 ppb) is the lowest numerical value that can be determined with suitable precision and accuracy and the detection limit (2 ppb) is the lowest numerical value that can be reasonably estimated by the instrument (typically half the quantitation limit). The summarized data provided below is an average of readings, including non-detect (values less than 2 ppb) readings taken at each instrument, therefore the average values (monthly and annually) are typically less than the detection limit of the Chemcassettes®.

In 2023, data logged readings, along with SPM maintenance records and associated weather data from an on-site weather station were provided to the MEDEP on a periodic basis. SPM maintenance includes Chemcassette® change outs, which generally occur every 6 weeks, along with recommended maintenance performed by the manufacturer.

The annual average H_2S calculated values at the Access Road, 552 West Old Town Road, the Old Stagecoach Road, and the West Coiley Road SPMs are presented in Table 2-1 & Figure 2-1. Due to the vast number of non-detect readings, also known as zero readings, the average H_2S values for all four meters were below the detection limit of 2 ppb for both 2022 and 2023.

Table 2-1 Annual SPM H_2S Averages, 2022 & 2023

Juniper Ridge Landfill 2022 Annual SPM H_2S Averages					
Location	**Bangor Wind Rose %[1]**	**Bangor Wind Rose % plus 50% calm[2]**	**Non-Detect Readings**	**Average in ppb (Non-Detect = 0 ppb)**	**Average in ppb (Non-Detect = 1 ppb[3])**

552 West Old Town Road	3.7%	12.3%	31,593	0.298	0.331
Old Stagecoach Road	7.2%	15.8%	29,884	0.438	0.500
West Coiley Road	13.3%	21.9%	28,440	0.532	0.640
Total Number of Readings in 2022: 34,746					
Juniper Ridge Landfill 2023 Annual SPM H_2S Averages					
Location	**Bangor Wind Rose %[1]**	**Bangor Wind Rose % plus 50% calm[2]**	**Non-Detect Readings**	**Average in ppb (Non-Detect = 0 ppb)**	**Average in ppb (Non-Detect = 1 ppb[3])**
Access Road	9.8%	18.9%	34,458	0.025	0.122
552 West Old Town Road	5.9%	15.0%	30,633	0.424	0.476
Old Stagecoach Road	9.7%	18.8%	34,738	0.002	0.099
West Coiley Road	16.3%	25.4%	28,171	0.480	0.612
Total Number of Readings in 2023: 34,746					

[1] Bangor Wind Rose percentage of time wind in direction of SPM.
[2] Bangor Wind Rose percentage of time wind in direction of SPM plus 50% of Calm.
[3] Used 1 ppb instead of 0 for non-detect readings when the wind was in the direction of meter and 50% of time when the wind was calm; percentages are shown for each SPM in the second column.

In addition, the annual average H_2S values at these meters were also calculated using the most recent local wind direction and duration data from the Bangor International Airport Weather Station. Non-detect readings were replaced with a conservative estimate of half the detection limit of the SPM's, 1 ppb, for the percentage of time wind was in the direction of each meter, along with half of the total calm wind rose data. This data evaluation technique was developed in cooperation with the City of Old Town during the review of the JRL Expansion Application. These results are also presented in Table 2-1 and shown in Figure 2-2.

When comparing the 2022 and 2023 Annual SPM H_2S averages of the four SPMs located around JRL, three of four SPMs saw a decrease during 2023. This was likely attributed to improvements made to the gas collection system and slightly lower volumes of sludge accepted at the site throughout the year. Overall, the average off-site H_2S levels remained very low during both 2022 and 2023. Monthly average H_2S calculated values for each location are shown in Figures 2-3 through 2-6 and should be used for comparative analysis only due to their low averages, below the quantitative and detection limits of the instruments. These averages were plotted via a simple average of the monthly readings, non-detect (zero) readings were not edited.

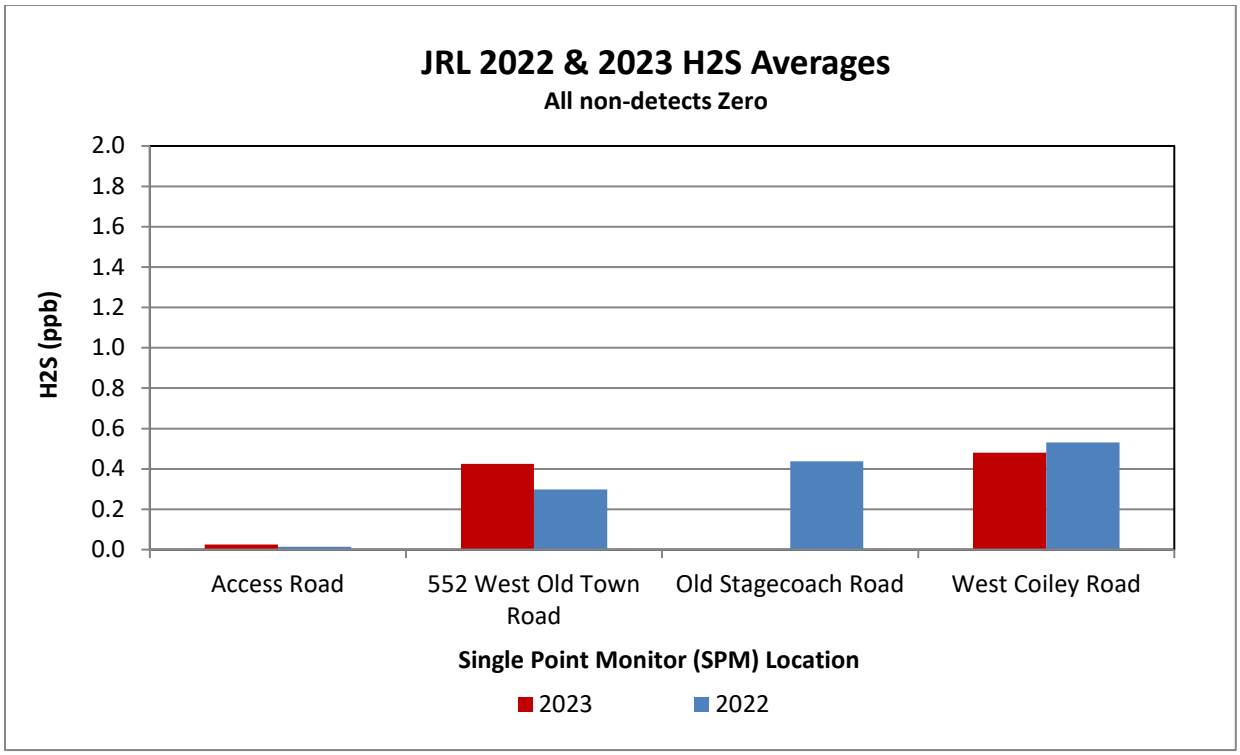

Figure 2-1 Annual Avg. H_2S readings at all four SPM locations, 2022 & 2023

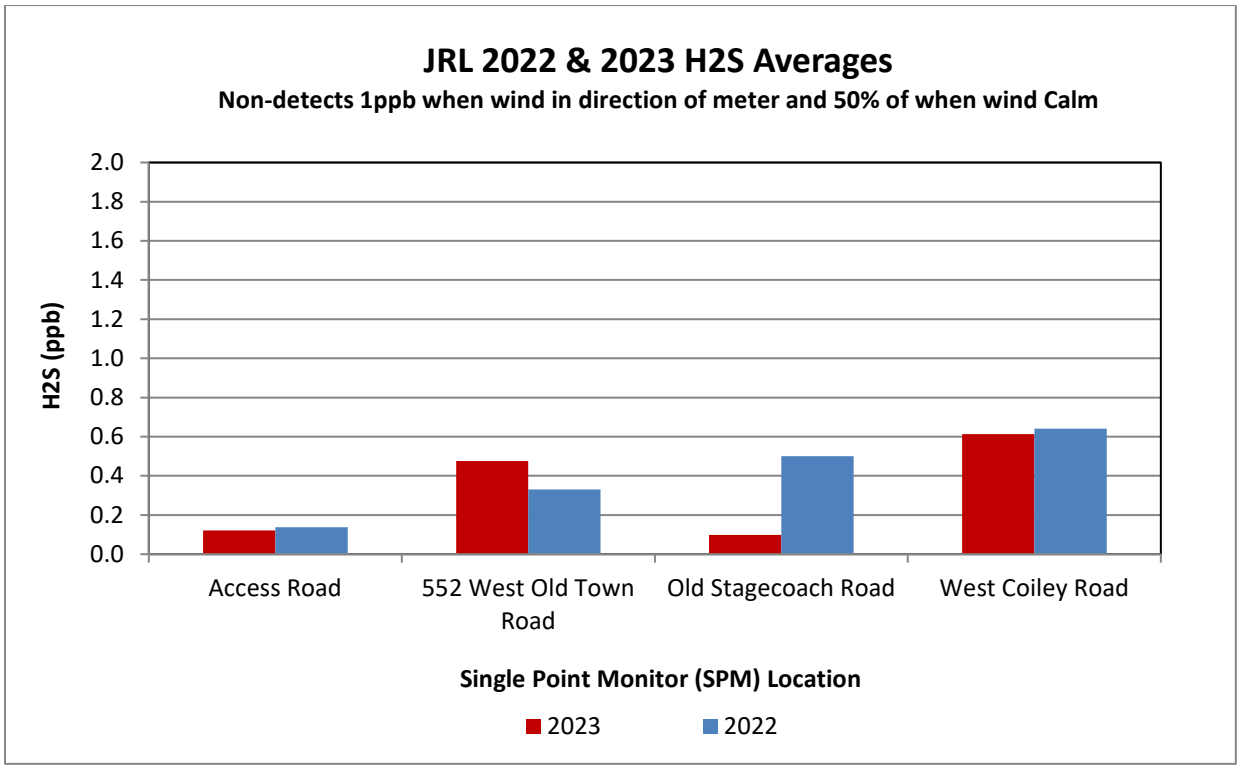

Figure 2-2 Annual Avg. H_2S readings at all four SPM locations with percentages of non-detects at 1 ppb based on wind rose data, 2022 & 2023

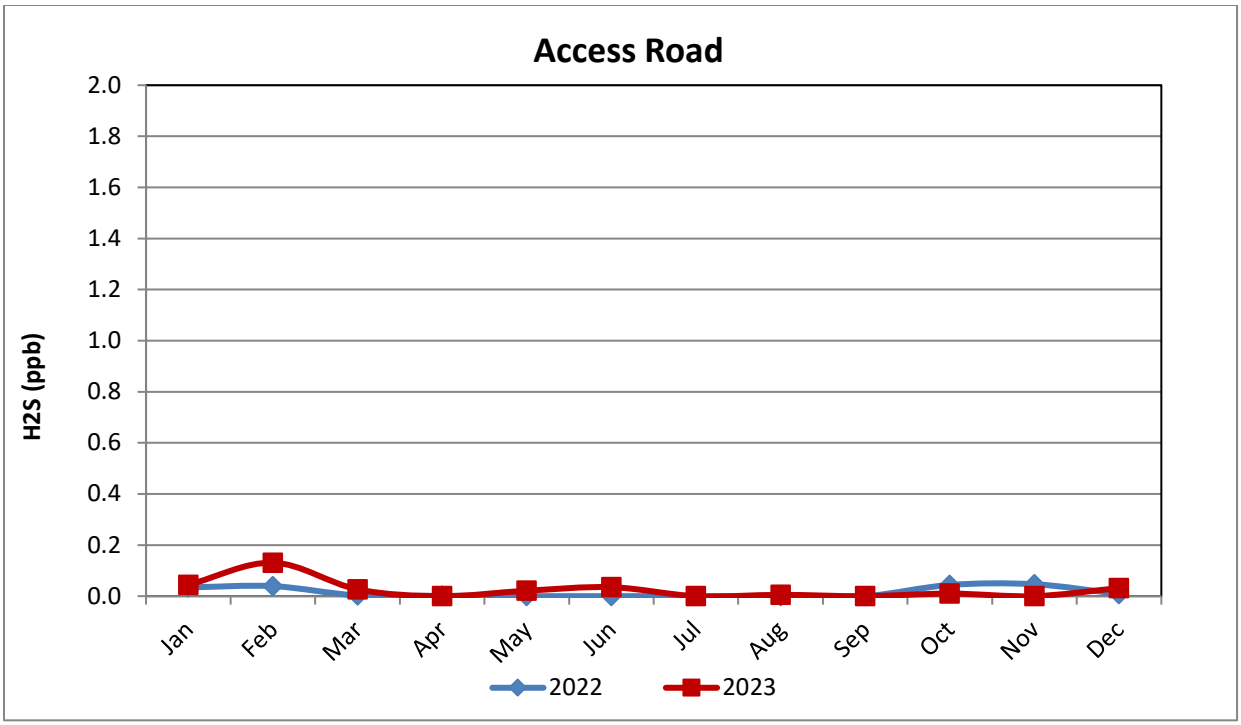

Figure 2-3 Monthly Avg. H_2S readings at the Access Road SPM, 2022 & 2023

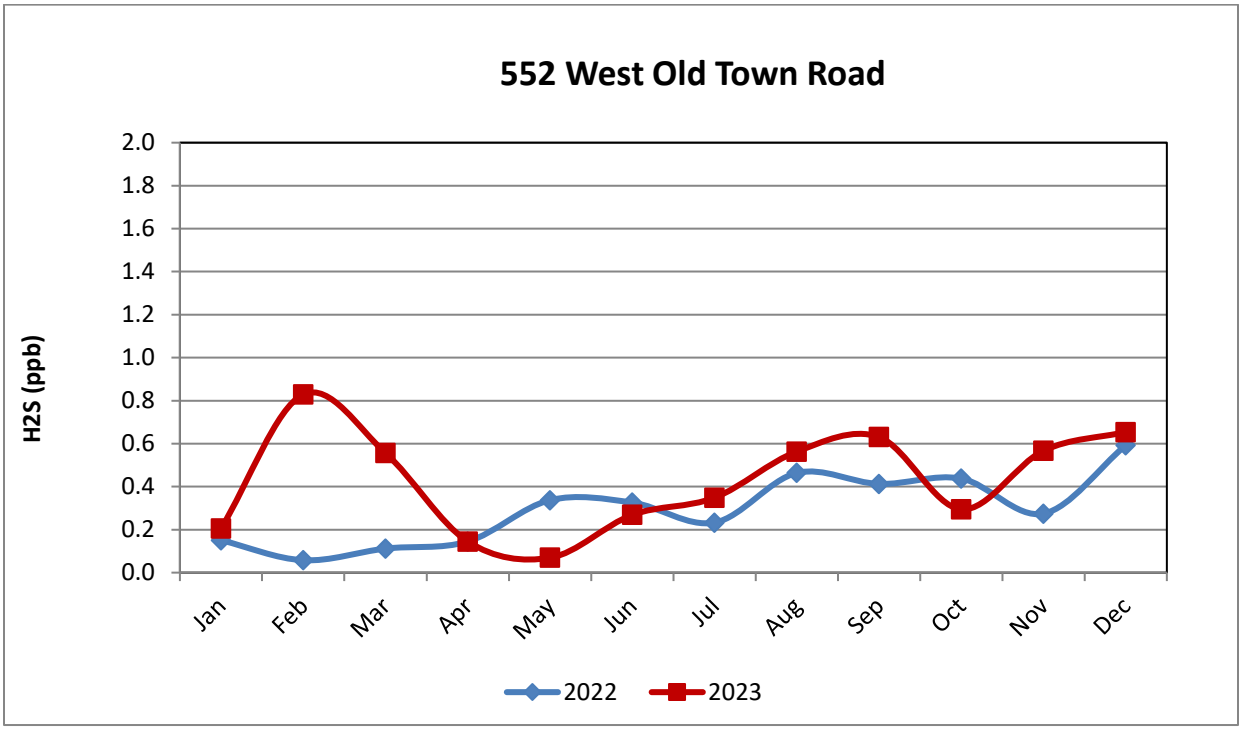

Figure 2-4 Monthly Avg. H_2S readings at the 552 West Old Town Road SPM, 2022 & 2023

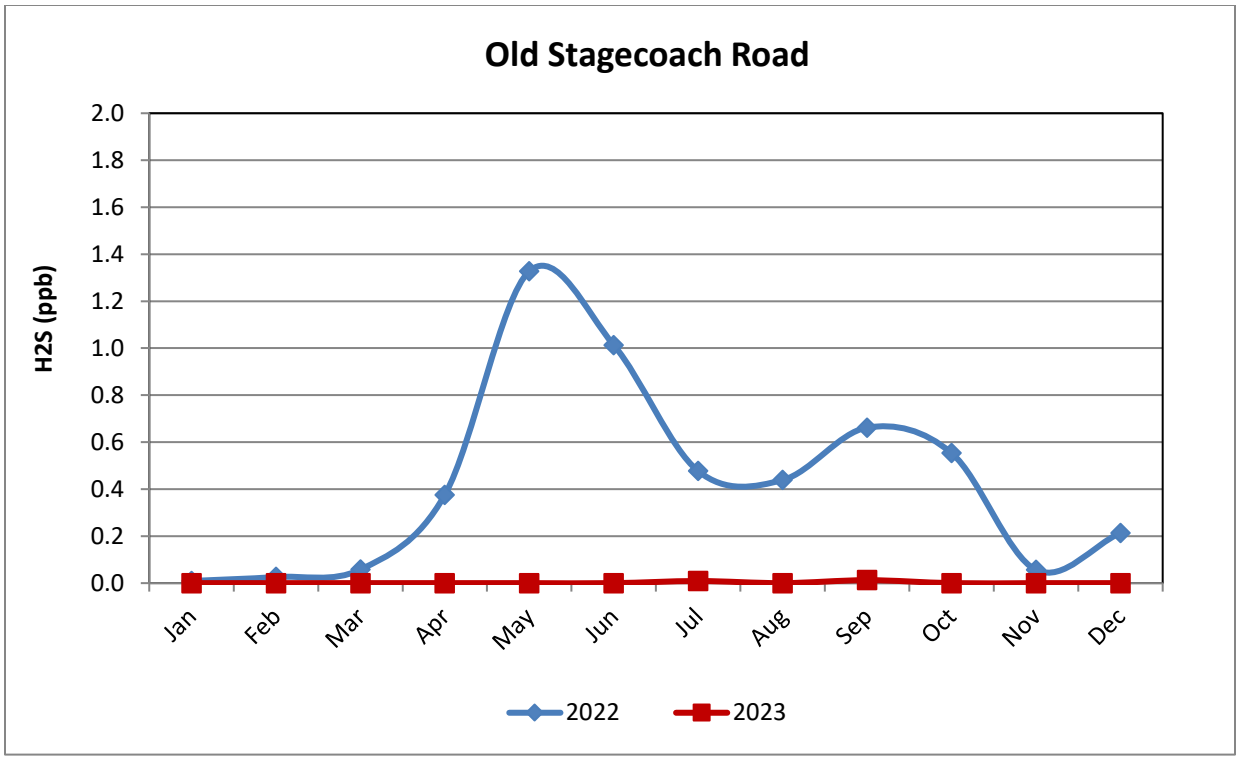

Figure 2-5 Monthly Avg. H_2S readings at the Old Stagecoach Road SPM, 2022 & 2023

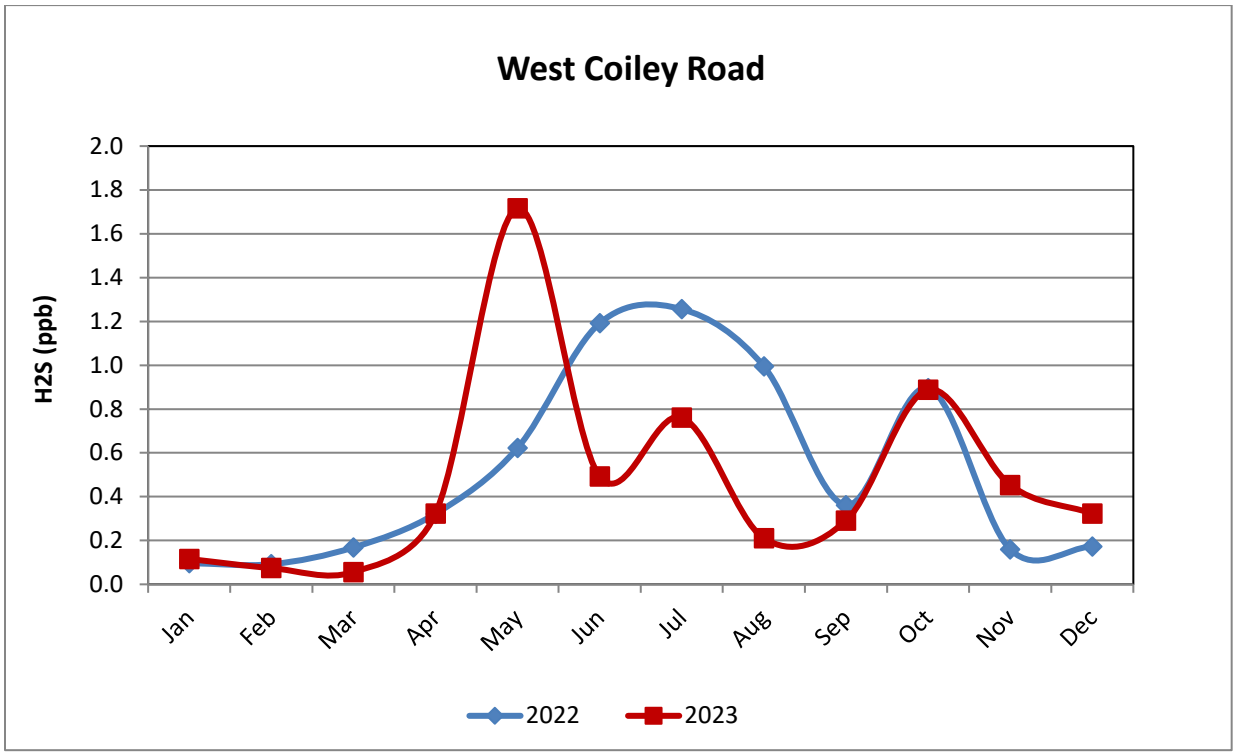

Figure 2-6 Monthly Avg. H_2S readings at the West Coiley Road SPM, 2022 & 2023

Instantaneous peak readings were identified during 2022 and 2023, to determine if any short duration H_2S episodes occurred. They are provided below in Table 2-2.

Table 2-2 Annual highest two readings at each SPM, 2022 & 2023

Juniper Ridge Landfill					
Hydrogen Sulfide Single Point Monitor					
Highest Two Annual Readings					
Year	**Location**	**Date**	**Highest Reading (ppb)**	**Date**	**2nd Highest Reading (ppb)**
2022	Access Road	1/25/2022 18:32	13.24	1/25/2022 18:47	12.13
2022	552 West Old Town Road	12/22/2022 9:23	32.71	12/22/2022 9:08	31.59
2022	Old Stagecoach Road	3/25/2022 22:04	20.14	3/25/2022 22:19	15.24
2022	West Coiley Road	2/23/2022 6:00	20.36	2/23/2022 6:15	7.68
2023	Access Road	12/24/2023 18:26	12.46	12/24/2023 18:11	12.35
2023	552 West Old Town Road	12/1/2023 20:55	28.70	10/11/2023 8:53	25.25
2023	Old Stagecoach Road	9/16/2023 16:38	18.02	9/16/2023 16:23	17.91
2023	West Coiley Road	11/18/2023 19:07	8.23	12/6/2023 18:07	8.12

Throughout 2023, there were 20 H_2S readings above 15 ppb at the four off-site SPM's. 18 of those reading occurred at the 552 West Old Town Road SPM, most during a few hour period on 12/01/23. This compares to 13 H_2S readings above 15 ppb (which occurred periodically for 6 days) during 2022. Occurrences were noted as required in the JRL Monthly Status Reports. Of the 20 H_2S readings, none recorded above 30 ppb requiring Old Town Code Enforcement to be notified. JRL staff took immediate action to get the identified issues resolved.

On-site landfill gas management systems continue to function well in preventing off-site migration of H_2S.

3.0 ODOR COMPLAINTS

Complaints recorded via the 24-hour JRL complaint hotline are provided for 2022 and 2023 in Table 3-1 below. Detailed complaint logs were submitted as part of the facility's monthly reports to the MEDEP during 2023. During 2023, the JRL complaint hotline received a total of 56 landfill related complaints. 49 of which were related to odor, 2 noise, 1 birds, and 4 other. Of the 49 odor complaints, 44 were confirmed as likely coming from the landfill.

This is an increase from 2022, which received a total of 35 landfill related complaints. 30

of which were related to odor, 3 noise, and 2 other. Of the 30 odor complaints, 28 were confirmed as likely coming from the landfill. 2 additional non-enforceable complaints were received during 2022. Both had nothing to do with landfill operations and therefore were not included in the 2023 totals. Site visits were conducted if requested, to allow for complaint validity. Close attention was paid to complaints, which helped determine operational effectiveness of all odor control measures and/or systems. Changes were made to those measures and/or systems as necessary.

In 2023, 12 different individuals called in the 49 odor complaints. This compares to 10 individuals who called in 30 odor complaints during 2022.

4.0 CH_4 SURFACE SCANS

Landfill methane (CH_4) emission surface scans are performed to determine the effectiveness of intermediate landfill cover and landfill gas collections systems in controlling landfill gas migration. Quarterly surface scans were completed on the landfill intermediate cover at JRL during 2023 in accordance with the JRL Operations Manual and the requirements of the New Source Performance Standards (NSPS) for municipal solid waste (MSW) landfills contained in 40 Code of Federal Regulations (CFR) Part 60, Subpart WWW. Copies of the 2023 surface scans are kept on file and uploaded to Sanborn Head and Associates' Landfill Gas Management Suite (LFGMS).

Surface scans were completed in general accordance with the procedures outlined in NSPS, specifically Section 60.753(d) which states that each owner or operator of an MSW landfill with a gas collection and control system shall: *"Operate the collection system so that the methane concentration is less than 500 parts per million above background at the surface of the landfill. To determine if this level is exceeded, the owner or operator shall conduct surface testing around the perimeter of the collection area and along a pattern that traverses the landfill at 30-meter intervals and where visual observations indicate elevated concentrations of landfill gas, such as distressed vegetation and cracks or seeps in the cover. The owner or operator may establish an alternative traversing pattern that ensures equivalent coverage…"*

Surface scans were completed using a Micro FID® (flame ionizing detector) or similar device (QED SEM-5000 portable methane detector, which NEWSME purchased in 2019). The Micro FID® device has a detection limit of 0.5 parts per million (ppm) and a concentration range of 0.5 to 50,000 ppm, while the QED SEM-5000 portable methane detector has the same detection limit but has a concentration range of 0.5 ppm to 100% methane. During 2023, a total of 9 readings above 500 ppm were detected during initial quarterly surface scans. This compares to 5 reading above 500 ppm which were detected in 2022. A quarterly breakdown is provided in Table 4-1. These readings and their locations were documented, with copies provided to the site supervisor, and necessary corrective actions were taken. Follow-up scans were performed 10 days and 30 days after the initial readings in excess of 500 ppm, or any subsequent reading in excess of 500 ppm.

Table 4-1 Readings above 500 ppm found during CH_4 Surface Scans, 2022 & 2023

Surface Scan Readings above 500 ppm					
	Q1	**Q2**	**Q3**	**Q4**	**TOTAL**
2023	1	3	0	5	9
2022	3	1	0	1	5

All areas with readings above 500ppm were resolved on the first initial rescan and follow-up. These results demonstrate the effectiveness of the synthetic and soil intermediate cover system. Damage to gas piping cover boots and areas requiring more intermediate cover, were the primary causes of readings above 500 ppm in 2023. Some items were addressed immediately and others as soon as practical.

5.0 SUMMARY

Two types of air monitoring activities occurred at the Juniper Ridge Landfill (JRL) during 2023; (1) hydrogen sulfide H_2S monitoring with stationary continuous monitors and, (2) quarterly methane emission surface scans on the landfill intermediate cover.

When comparing the 2022 and 2023 Annual SPM H_2S averages of the four SPMs located around JRL, three of four SPMs saw a decrease during 2023. This was likely attributed to improvements made to the gas collection system and slightly lower volumes of sludge accepted at the site throughout the year. Overall, the average off-site H_2S levels remained very low during both 2022 and 2023.

Throughout 2023, there were 20 H_2S readings above 15 ppb at the four off-site SPM's. 18 of those reading occurred at the 552 West Old Town Road SPM, most during a few hour period on 12/01/23. This compares to 13 H_2S readings above 15 ppb (which occurred periodically for 6 days) during 2022. Occurrences were noted as required in the JRL Monthly Status Reports. Of the 20 H_2S readings, none recorded above 30 ppb requiring Old Town Code Enforcement to be notified. JRL staff took immediate action to get the identified issues resolved. On-site landfill gas management systems continue to function well in preventing off-site migration of H_2S

During 2023, the JRL complaint hotline received a total of 56 landfill related complaints. 49 of which were related to odor, 2 noise, 1 birds, and 4 other. Of the 49 odor complaints, 44 were confirmed as likely coming from the landfill. This is an increase from 2022, which received a total of 35 landfill related complaints. 30 of which were related to odor, 3 noise, and 2 other. Of the 30 odor complaints, 28 were confirmed as likely coming from the landfill.

During 2023, a total of 9 readings above 500 ppm were detected during initial quarterly surface scans, compared to 5 which were detected during 2022. Repairs were promptly corrected. Follow-up readings confirmed the issues were resolved.

Lake George, NY 12845

EXECUTIVE SUMMARY

This 2023 Annual Landfill Geotechnical Monitoring Report for the Juniper Ridge Landfill (JRL) summarizes the geotechnical conditions of the facility over the past year. These conditions were ascertained from monitoring that was performed to assure that the field behavior of the landfill continues to be consistent with parameters and assumptions used in the facility design. This report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application (SME 2015a) for a new solid waste license, as approved by the Board of Environmental Protection under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017.

The geotechnical monitoring at JRL during 2023 emphasized weekly stability and settlement observations of the landfill surface made during operations, and independent geotechnical observations of the landfill surface and slope topography conducted on September 6, 2023. Other specific monitoring activities in 2023 included: (a) comparisons of semi-annual topographic surveys, (b) review of waste types, quantities, and location of waste placement, and (c) evaluation of fluid pressure data measured by an electronic transducers placed on the base of Cells 11 to 15 to indicate the leachate head on the liner and to track whether or not the leachate collection system performance is consistent with design assumptions.

This document supplements previous monitoring reports made through 2010 (REW 2005a, 2006, 2007a, 2008a, 2009, 2010), and subsequent landfill inspection reports from the last twelve years (REW 2011 to 2023). All monitoring data indicates that settlement and stability of the landfill waste is consistent with design parameters and assumptions. Information provided by the Cells 11 to 15 transducers demonstrate that the fluid levels in the leachate collection layer are at minimal levels, verifying that this drainage layer is performing as designed. No changes to the Geotechnical Monitoring Plan are proposed for geotechnical monitoring during 2024.

2023 Annual Landfill Geotechnical Monitoring Report
Juniper Ridge Landfill Facility
Old Town, Maine

1. INTRODUCTION

This 2023 Annual Landfill Geotechnical Monitoring Report has been prepared for the State of Maine's Juniper Ridge Landfill (JRL), a facility that is owned by the State of Maine Bureau of General Services (BGS) and operated by NEWSME Landfill Operations, LLC. (NEWSME), a subsidiary of Casella Waste Systems Inc. (CWSI). The landfill site plan (Figure 1), is based on an aerial topographic survey performed on June 23, 2023.

This report describes the geotechnical activities performed in accordance with the current Geotechnical Monitoring Plan (Appendix N of the Operations Manual) and Stability and Settlement Monitoring Plan (Section 3.1.5 of the Design Report), prepared and included as part of the JRL Expansion Application (SME 2015a,b) for a new solid waste license, as approved by the Board of Environmental Protection under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N dated 06/01/2017. This report presents the results of this monitoring that verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2023).

2. HISTORY OF LANDFILL DEVELOPMENT & MONITORING

JRL was initially developed by Fort James Operating Company (FJC), a subsidiary of Georgia-Pacific Corporation, for its private use in the disposal of treatment plant sludges and other wastes from its mill in Old Town, Maine. In 2004, the State of Maine, through the State Planning Office (SPO), agreed to purchase the landfill for disposal of other approved in-state wastes including: construction and demolition debris (CDD), oversized bulky waste (OBW), front end processing residue (FEPR), ash from waste incinerators, other ashes from industrial incinerators, bypass municipal solid waste (bypass MSW), and other miscellaneous wastes. This section discusses the history of landfill development at the site.

2.1 Fort James Operation

Approximately 68 acres of a 780-acre property was licensed by FJC as a secure landfill, and operated by FJC from 1996 until 2004 when the State of Maine purchased the landfill. During this period, JRL, then called the West Old Town Landfill (WOTL), was used mainly for disposal of combined sludge from FJC's primary and secondary treatment plant in Old Town and fly ash from a biomass boiler at Eastern Paper's mill in Lincoln. Placement of the sludge began in December 1996 along the western portion of Cell 1. By 2001, operations had moved to the east into Cell 2. Details relating to the geotechnical behavior of FJC's sludge during the sequential landfill development is presented in previous reports (REW 2007a,b).

		Client: State of Maine BGS/NEWSME Landfill Operations LLC, Old Town, Maine	Scale: ~1" = 375'	

2.2 State of Maine Purchase and Operations

In February 2004, the State of Maine, through the SPO, purchased the landfill from FJC. It selected CWSI through its subsidiary NEWSME, to operate the disposal of in-state wastes. Approximately 50,000 tons of sludge from FJC's Old Town mill were initially placed in landfill Cells 1 & 2 before the mill closed in 2006. To improve deposit stability, CWSI stabilized the existing sludge at the site by mixing it with approved in-state waste streams, i.e. CDD, OBW, FEPR, incinerator ash, bypass MSW, and other miscellaneous wastes. A detailed description of the test plots constructed to determine the geotechnical behavior of this waste and the sludge stabilization program were presented in previous annual monitoring reports (REW 2005a, 2006, 2007a, 2008a, 2009, 2010, 2011) and an annual geotechnical landfill inspection report (REW 2012).

Once the sludge stabilization program was completed by mid-2006, landfill operations moved into Cell 3A/B, followed sequentially with Cells 4-10 under MEDEP Solid Waste License #S-020700-WD-N-A. Deposited in these cells was a mixture of in-state wastes, which included but not limited to various percentages of CDD, MSW (Cells 3-10 only), bypass MSW, OBW, MSW incinerator ash and other ashes, CDD wood fines for cover, contaminated soils, WWTP/POTW sludge, lime mud and grit, oil spill debris, pulp mill waste, other approved miscellaneous special wastes.

In mid-2015, with the help of SME, BGS/NEWSME submitted JRL Expansion Application (SME 2015a,b) to the MEDEP. On June 6, 2017, that application was approved by the BEP under Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N. During 2018, the first cell (Cell 11) of a 6-cell, 54 acre landfill expansion was constructed. As a result, a mixture of similar in-state wastes as described above for Cells 3-10, (excluding MSW for Expansion Cells 11-16) was approved. Based on performance to date, this mixture of wastes is stable at slopes up to 2.5H:1V. While the mixture from these waste streams is still highly compressible and subject to gas generation, , the in-state waste mixture is more stable and less compressible than the waste-stabilized sludge based on more than 13 years of operational experience.

2.3 Overview of Past Geotechnical Monitoring

Once the stability of the waste-stabilized sludge was resolved (see MEDEP 2008; REW 2008b; *2008 GMR*, REW 2009; *2010 GMR*, REW 2011), the previous program (REW 2007b) was modified to represent the monitoring needs associated with current waste mixtures placed in a landfill founded on a firm soil (see *2011 GMR*, REW 2012). Specifically, reliance on the extensive measurements of in-situ instruments was shifted to observation methodologies that are used to assure that the geotechnical performance of the landfill remained consistent with design analyses. This approach has been in service since 2010 and now applied to the most recent GMP included in the JRL Expansion Operations Manual (NEWSME 2023).

3. 2023 WASTE PLACEMENT AND OPERATION

In 2023, a majority of waste was placed in the landfill capacity of Cells 13 and 14 (see Appendix F site photos #11, 12, and 14-21). Lesser amounts were also placed as soft layer material in the newly constructed Cell 15 (photos #12-14, and 19-21), on the northern part of Cell 9 (photos #7, 8, 29, and 30), and the side slope of Cell 10 (photos #1-3 and 31-34), in preparation for Stage 1 Final Cover to be installed. As summarized in Appendix A herein, waste composition during this period was dominated by forms of CDD, bypass MSW, OBW, MSW incinerator ash and other ashes, CDD wood fines for cover, contaminated soils, WWTP/POTW sludge, oil spill debris, pulp mill waste, and other approved miscellaneous special wastes. By mid-year (when the aerial photography was made), approximately 100 feet of the mixed waste was in place in Cell 14, raising its grade to an average elevation of approximately 300 ft. mean sea level (msl). Likewise, by mid-year, waste had also been placed in Cell 13, raising its grade to an average elevation of roughly 340 msl. During the summer and fall of 2023, waste placement continued into Cells 13 and 14 and moved into Cell 15.

The remaining landfill capacity in Cells 1-15 at the end of 2023 is summarized in Appendix B. As the capacity of these cells is exhausted, expansion will continue in two additional landfill cells (i.e. Cells 16 to 17) located north of the existing operations. It is expected that future expansion cells will receive similar types and quantities of wastes placed in previous years during the operation of Cells 11 through 15.

4. 2023 GEOTECHNICAL LANDFILL MONITORING

During 2023, various monitoring was performed at JRL to ensure compliance with JRL's Solid Waste License #S-020700-WD-BI-N and Natural Resources Protection Act #L-19015-TG-D-N. Results of this monitoring verifies the consistency of the landfill's geotechnical performance with design parameters and assumptions, and with the goals of the JRL Expansion Operations Manual (NEWSME 2023). Specifically, geotechnical monitoring during this past year included: (1) visual observation of landfill slope stability, settlement, and general landfill conditions, (2) assessment of site aerial topographic surveys; (3) a review of waste types, quantities, location of waste placement, and filling sequences, and (4) evaluation of fluid levels in the leachate collection layers of Cells 11 to 15.

4.1 Landfill Observations

During 2023, performance of JRL was verified by routine weekly visual site inspections of the landfill during normal operations. A sample copy of the weekly/monthly inspection forms is presented in Appendix C (with copies of any specific inspection available upon request). Observations made during these inspections help confirm the corroboration of landfill performance with the design conditions used in the geotechnical analysis. In part, the revised stability and settlement analyses completed for the landfill design (REW 2005b, SME 2015b) were verified in the field by monitoring the type, quantity, rate, location, and condition of waste placement in accordance with the JRL Expansion Operations Manual (NEWSME 2023).

4.2 Annual Inspection

To supplement weekly operational observations, an annual geotechnical inspection of the landfill area (performed on September 6, 2023) focused on the overall condition of the landfill that specifically looked for evidence of cracking, localized depressions, erosion, leachate breakout on sideslopes, areas of ponded water, stressed vegetation, and toe heaving. As previously mentioned, normal operations were taking place in Cells 9, 13, 14, and 15. Synthetic Intermediate Cover Material (SICM) and, in small areas, earthen intermediate cover has been placed over the inactive portions of the landfill.

Geotechnical observations were made to confirm that waste placement procedures, sideslope construction, cover performance, and other construction/filling practices are consistent with the JRL Expansion Operations Manual (NEWSME 2023). An observation report, using the checklist presented in the current GMP, was filled out and is included in Appendix D of this report.

Inspection elements for assessment of geotechnical performance included:

Active Areas

- waste lift thickness
- active filling area slope angle
- final waste slope angle
- identification of areas with visible ponding, seepage, or indications of mass snow burial

Inactive Areas with Intermediate Cover (SICM or earthen material)

- overall surface and/or intermediate cover condition
- evidence of surface cracking
- localized surficial depressions in waste or cover surface
- erosion of cover material
- erosion of ditch linings
- leachate breakout on sideslopes
- areas of ponded water
- toe heaving
- grass kills
- gas venting

Geotechnical performance observations indicated that the landfill slopes were stable and that differential waste settlement was minor and can be managed to tolerable levels during final cover design. The active waste placement in Cells 9, 13, 14, and 15 is performing as anticipated. At the time of the inspection, there were no indications of inconsistencies between site activities and JRL Expansion Operations Manual (NEWSME 2023).

4.3 Fluid Pressure Measurements

In accordance with the Board Order for the landfill expansion, a fluid pressure transducer was installed in the leachate collection layer of Cells 11 to 15 (at the locations shown on Figure 1) to confirm system design by measuring fluid levels in this drainage layer. These instruments were placed at the bottom of the 12-inch sand layer of the leachate collection system that overlies the geocomposite layer of the containment liner.

To help determine the degree that the hydraulic head within the leachate collection layer is minimized, daily instrument readings were recorded during 2023 as presented in Appendix E. The small values demonstrate that the levels are minimal, verifying that the leachate collection at these locations in Cell 11 to 15 are performing in accordance with design.

4.4 Surveys

A topographic survey of the landfill surface was completed on June 23, 2023 using aerial photogrammetric methods. A spot check of surface elevations indicates that the waste slope angles are consistent with the project design and JRL Expansion Operations Manual (NEWSME 2023). Elevation contours for covered areas were visually examined for depressions, heaving, and ditch slope continuity. Consistent with site observations, these observations indicate that the landfill is performing as anticipated during design with no noticeable excessive differential settlements or instabilities. Exclusive of the excavation area in Cells 1 & 2, comparisons with the aerial survey made in June 2023 show no discernable differences in the overall topography of the landfill surface that would indicate large differential settlements or slope instabilities.

4.5 Modifications to the Geotechnical Monitoring Plan

As addressed the last three years, the current GMP (included as part of the JRL Expansion Operations Manual, NEWSME 2023), includes weekly routine inspections and an evaluation of fluid levels in the leachate collection layer of JRL expansion cells (i.e. Cells 11 to 17). No other modifications to the GMP are proposed for 2023.

5. SUMMARY

Geotechnical monitoring of JRL was performed to verify that the operations and field behavior of the facility is consistent with design analyses and geotechnical plans. Consistent with the modifications in 2008 and 2010, field observations of landfill activities were emphasized in assuring consistency with the JRL Expansion Operations Manual (NEWSME 2023) and, in the process, confirmed that there were no indications of potential slope instabilities or excessive differential settlements that might impact the performance of the facility.

In accordance with the current GMP (which is included as part of the JRL Expansion Operations Manual, NEWSME 2023), routine weekly visual site inspections of the landfill were made during normal operations in 2023. In addition, an aerial topographic survey of the facility was conducted on June 23, 2023, and an annual geotechnical inspection was performed on September

6, 2023. This monitoring documented that the landfill is performing as anticipated with no excessive deformations, slope movements, unexplained ponded water, or leachate breakouts. Site observations made of the inactive areas and the operational activity in Cells 1 to 3 and 12 to 15 indicate that the landfill is performing as anticipated during design. Measurements of the fluid levels in the leachate collection system at the base of Cells 11 to 15 (as measured by the in-place transducers) indicate that the head on the liner system is minimal and is performing in accordance with design.

APPENDIX A

Summary of Wastes Accepted at Juniper Ridge Landfill Report 2023

Summary of Wastes Accepted at Juniper Ridge Landfill Report Year 2023				
Waste Type #	**Waste Types**	**Total (tons)**	**Origin**	**% Total Waste**
1	Bypass MSW[5]	266,452	Maine	31.9
2	CDD/MSW Processing Residue - OBW (Disposed of in the Original 2004 Permitted Footprint)	10,679	Maine	1.3
3	CDD/MSW Processing Residue - OBW (Disposed of in the Expansion Permitted Footprint)[4]	67,994	Maine	8.1
4	Recycled/Reused CDD Processing Fines[1]	50,774	Maine	6.1
5	Mixed CDD	347,016	Maine	41.6
6	Recycled/Reused Wood from CDD[2]	248	Maine	0.0
7	Residue/Trash from Single Stream	8,239	Maine	1.0
	Special Wastes Types			
8	Burn Pile Ash and/or Hot Loads Area Ash	339	Maine	0.0
9	Burnt Structure Debris/Ash	350	Maine	0.0
10	Catch Basin Grit & Street Sweeping	559	Maine	0.1
11	Coal, Oil & Multi-fuel Boiler Ash	1,355	Maine	0.2
12	Contaminated Soil & Debris	4,095	Maine	0.5
13	Industrial (Miscellaneous)	131	Maine	0.0
14	Industrial WWTP Sludge	9,086	Maine	1.1
15	Leather Scraps	51	Maine	0.0
16	Lime Mud/Grit	1,168	Maine	0.1
17	MSW Incinerator Ash	2,619	Maine	0.3
18	Municipal WWTP/POTW Sludge	57,090	Maine	6.8
19	Non-Friable Asbestos	670	Maine	0.1
20	Non-Hazardous Chemical Related	723	Maine	0.1
21	Oil Spill Debris	2,191	Maine	0.3
22	Polyethylene & Cellulose Trimmings	145	Maine	0.0
23	Pulp Mill Waste	538	Maine	0.1
24	Sandblast Grit	244	Maine	0.0
25	Spoiled Foods	328	Maine	0.0
26	Sulfur Scrubbing Residues	699	Maine	0.1
27	Water/Air Filtration Media	7	Maine	0.0
28	WWTP Grit Screenings	574	Maine	0.1
SUBTOTAL WASTE TYPES 1-7		751,402	Maine	90.1
SUBTOTAL WASTE TYPES 8-28		82,961	Maine	9.9
GRAND TOTAL WASTE RECEIVED[3]		**834,363**	Maine	

1. Materials recycled/reused as alternative daily cover (ADC).

2. Wood from CDD was received at the Juniper Ridge Landfill wood storage facility then chipped and recycled/reused as ADC.

3. Total does not include construction materials. In 2023, 40,446.44 tons of Construction Fines were delivered from Resource in Lewiston. These fines were manufactured to meet construction specifications for the Stage 1 Final Cover and side slope grading requirements prior to installing synthetic intermediate cover. Total derived from sum of higher significant digit numbers, not rounded whole numbers as provided in the above table.

4. The previous limit of 65,000 tons per year, set by expansion license #S-020700-WD-BI-N, was modified through solid waste minor revision #S-020700-WD-CM-M. The minor revision approved the methodology and process used to determine JRL's annual OBW limit of 85,000 tons in the Expansion area for 2023. The approval was granted on 04-25-23.

5. CRM/MRC 61,279.69 tons, ecomaine 5,981.54 tons, PERC 185,328.99, MMWAC 13,861.54 tons.

APPENDIX B

JRL Estimate of Landfill Capacity December 31, 2023

Juniper Ridge Landfill
Estimate of Remaining Capacity as of December 31, 2023

	Values	Units	Source	
Landfill Capacity Remaining in Cells 1-10 as of December 31, 2022	720,538	cy	Calculated 2022 capacity evaluation	MSE Berm used for final waste surface for Cells 1-10 as permitted
Landfill Capacity Remaining in Cells 11-17 as of December 31, 2022	5,611,634	cy	Calculated 2022 capacity evaluation	
Remaining Site Capacity as of June 23, 2023 in landfill Cells 1-10	556,900	cy	June 23, 2023 Site Survey	MSEBerm used for final waste surface for Cells 1-10
Remaining Site Capacity as of June 23, 2023 in Expansion Cells 11 thru 17	5,356,400	cy	June 23, 2023 Site Survey	
Tons Placed in Landfill Cells 1-10 (tons) between June 24, 2023 and December 31, 2023.	44,211.88	tons	JRL Records	Wendy Plissey 02-13-2024
Tons Placed in Expansion Landfill Cells 11-17 (tons) between June 24, 2023 and December 31, 2023.	412,448.30	tons	JRL Records	Wendy Plissey 02-13-2024
Compaction Factor Three Year Running Average through June 2023	0.82	ton/cy	JRL Records	
Calculated Capacity Used in Cells 1-10 between June 24, 2023 and December 31, 2023 (CY)	53,917	cy	Calculation	
Calculated Capacity Used in Cells 1-10 in 2023	217,555	cy	Calculation;	Compaction factor change from 0.83 to 0.82.
Compaction used in Cells 11-17 between June 24, 2023 and December 31,2023	0.82	ton/cy	JRL	
Calculated Capacity Used in Cells 11-17 between June 24, 2023 and December 31, 2023 (CY)	502,986	cy	Calculation	
Calculated Capacity Used in Cells 11-17 in 2023	758,220	cy	Calculation	
Estimated Remaining Cell 1 thru Cell 10 Capacity as of December 31, 2023	**502,983**	**cy**	Calculation	Includes MSE Berm Capacity
Estimated Remaining Cell 1 thru Cell 15 Capacity as of December 31, 2023	**2,129,897**	**cy**	Calculation	Based on Cell 1 thru 15 Capacity Remaining reported as of 6-23-2023 minus capacity consumed to end of 2023.
Estimated Remaining Site Capacity in Cells 11-17 as of December 31, 2023	**4,853,414**	**cy**	Calculation	
Tons Disposed of in Landfill Cells 1 thru 10	**80,087**	**Tons**	Provided by JRL	Provided by NEWSME
Tons Disposed of in Landfill Cells 11 thru 15	**754,276**	**Tons**	Provided by JRL	
Total Reported Tons Disposed of in Entire Landfill Cells 1 thru 15	**834,363**	**Tons**	Provided by JRL	

Appendix C

Weekly/Monthly
Landfill Inspection Form

WEEKLY/MONTHLY INSPECTION FORM

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	08-10-2023
Inspector Name/Signature	Luigi S. Pizzuti

Note: For weekly inspections, only Table 1 and Table 3 need to be completed. For monthly inspections, Tables 1, 2 and 3 need to be completed.

Table 1
Inspection of Active Areas at the Facility

Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☒ Yes ☐ No	☒ Comments (see below)
Borrow Pit	Is there evidence of tracking or erosion from site soil borrow areas with potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Mobile Equipment	Is mobile equipment leaking oil or other liquids with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)

Active Areas at the Facility	
Comments	Some trash and sediment in stormwater conveyance ditches near landfill access roads. Need to be cleaned out.

Table 2
Inspection of Stabilized Areas at the Facility

Stabilized Active Areas at the Facility			
Leachate	Is leachate observed on the ground, or leaking from tanks or piping, with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
Access Roads	Are industrial materials, residue or trash observed on roads where vehicles enter or exit the active landfill with evidence of or the potential to impact stormwater?	☐ Yes ☒ No	☐ Comments (see below)
MSW and CDD (windblown debris)	Is MSW and/or CDD on ground, tracking, blowing or whirling with evidence of or the potential to impact stormwater?	☒ Yes ☐ No	☒ Comments (see below)
Comments	See comments above. Also other stormwater conveyance ditches need to be cleaned of trash and sediment.		

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Detention Pond 1	good
Geomembrane Lined Storage Pond	good
Detention Pond 2	good
Detention Pond 6	good
Litter Fence	litter fence along east access road has some holes in it. Working but could eventually use repair.
Lechate Storage Tank Containment Area	good
Leachate Storage Tank Containment Area Riprap Outlet	good
Leachate Loading Rack Catch Basin	good
Detention Pond 9	good
2,000-Gallon Underground Storage Tank	good
Detention Pond 5	good
Outfall No. 1	good
Outfall No. 2	good
Outfall No. 3	good

Table 3
Inspection of Stormwater BMPs, Conveyances and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly.
Outfall No. 4	Good
Outfall No. 5	Good
Outfall No. 6	Good
Outfall No. 7	Good

Table 4
New Potential Pollutant Source and/or Recommendations for Additional BMPs

Reference	Description	Schedule

Certification

☒ Site is in compliance with SWPPP and MSGP.
☐ Site is not in compliance with SWPPP and MSGP and either structural control measure maintenance, additional controls, or modifications to the SWPPP are required.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signature: Jeff P	**Date:** 08-10-23

CORRECTIVE ACTION REPORT

Site Name/Company: JRL Landfill	
Location: Old Town, ME	
Contact Name: Luigi Pizzuti	**Contact Signature:**
Date of Discovery: 08-10-2023	
Date of Corrective Action Initiation: 08-10-2023	
Date of Corrective Action Completion: 08-18-2023	
Condition Requiring Corrective Action	Clean out trash and sediment from east side road drainage conveyances
Immediate Measures Taken to Control	Trash removed and drainage conveyances cleaned.
Measures Taken to Prevent Re-Occurrence	Keep up with maintenance of drainage conveyances.

Corrective actions must be completed within 14 days of the discovery of the condition. SWPPP modifications must be completed within 14 days of the completion of the corrective action. In the case of a spill, fill out Appendix E – Spill Report in addition to this form.

If it is not feasible to complete the corrective action within 14 days, please describe the reason and proposed schedule for completion: _____

_____

_____

If corrective actions cannot be completed within 45 days of discovery, MEDEP must be notified.

ROUTINE INSPECTION REPORT

Site Name/Company	Juniper Ridge Landfill/NEWSME Landfill Operations, LLC
Location	2828 Bennoch Road, Alton, Maine
Date of Visit	11-18-23
Inspector Name/Signature	Jeffrey Pelletier /
Weather	Raining

Does this inspection qualify as the one required annual inspection conducted during qualifying storm event? ☒ Yes ☐ No

Are there any new discharges or pollutants at the site? ☐ Yes ☒ No

Table 1
Inspection of Potential Pollutant Sources (PPS)

	Description
Industrial Activity or Area	**Describe where any of the following were observed:** • **Any discharges present at the time of inspection;** • **Any evidence of pollutants entering the drain system or outfalls;** • **The condition of the outfalls, including any restricted flow;** • **Industrial materials, residue or trash on the ground;** • **Leaks or spills from industrial equipment, drums, barrels, tanks or other containers;** • **Offsite tracking of industrial or waste materials or sediment; and** • **Tracking or blowing of raw, final, or waste materials.**
Scale House and Scale	Scale Area Clean + orderly
Soil Stockpile Areas	Good, piles recently mulched + seeded
Borrow Pit	Good, Area recently mulched + seeded
Wood Waste Handling Area	Began chipping wood pile. Contained to area. Overall looks good
Maintenance Building	Overall looks good + well organized.

Table 1
Inspection of Potential Pollutant Sources (PPS)

Rubb Building	Looks good
LFG Treatment Facility	Looks good
RNG Facility	Under construction but Archaea is doing a good job to minimize Stormwater impacts. Good
Leachate Storage Tank	No evidence of leaks, looks good
Leachate Loading Rack	No evidence of leaks, looks good
Leachate Collection System	Good, System seems to be working as intended
Gravel Laydown Area	well organized
Employee Parking Area	Good, no issues
1,500-Gallon Gasoline Tank	Good, no signs of leaks, containment empty.
2,500-Gallon Diesel Delivery Truck	Good, no signs of leaks
Access Roads	Good, recently graded on South end, Paving access road scheduled soon. Light litter along couple areas along the Landfill perimeter road.

Table 2
Inspection of Structural Control Measures and Outfalls

BMP	Describe where any of the following were observed: • Any evidence that the BMP is not functioning properly; • Any evidence of erosion; and • Industrial materials, residue, or trash.
Detention Pond 1	Good, recently upgraded
Geomembrane Lined Storage Pond	Good, functioning properly
Detention Pond 2	Good, functioning properly
Detention Pond 6	Good, functioning properly
Litter Fence	Good
Leachate Storage Tank Containment Area	Good, empty no signs of leaks
Leachate Storage Tank Containment Area Riprap Outlet	Good, functionly properly
Leachate Loading Rack Catch Basin	Good, functioning properly
Detention Pond 9	Good, functioning properly
2,000-Gallon Underground Storage Tank	Good, functioning properly, no signs of leaks
Detention Pond 10	Good, functioning properly
Detention Pond 11	Good, functioning properly
RNG Facility Stormwater Pond	Good, functioning properly

Table 2
Inspection of Structural Control Measures and Outfalls

Outfall No. 1	good, pretty clear flow today, working as intended
Outfall No. 2	good, pretty clear flow today, working as intended
Outfall No. 4	good, no flow yet today but looks good.
Outfall No. 5	good, clear flow today, working as intended
Outfall No. 6	good, pretty clear flow, working as intended
Outfall No. 7	good, pretty clear flow, working as intended

Table 3
Corrective Actions Required for PPS(s) and/or Existing Structural Control Measures

Reference	Description/Schedule	Date Completed
See Attached		

Table 4
Recommendation for New PPS(s) and/or Structural Control Measures

Reference	Description/Schedule	Date Completed

Table 5
Modifications Required to SWPPP or Site Plan

Reference	Description

Certification

☒ Site is in compliance with SWPPP and MSGP. ☐ Site is not in compliance with SWPPP and MSGP and either structural control measure maintenance, additional controls, or modifications to the SWPPP are required.
I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

CORRECTIVE ACTION REPORT

Site Name/Company:	Juniper Ridge Landfill
Location:	2828 Bennoch Road, Alton, ME
Contact Name: Jeffrey Rellstab	**Contact Signature:**
Date of Discovery:	11-18-23
Date of Corrective Action Initiation:	11-20-23
Date of Corrective Action Completion:	11-28-23
Condition Requiring Corrective Action	Light litter along a couple Areas along the landfill perimeter road and the road near the entrence of Cell 5
Immediate Measures Taken to Control	Informed Site Supervisor/Environmental Analyst. Pickers Scheduled.
Measures Taken to Prevent Re-Occurrence	Stay on top of litter patrols.

Corrective actions must be completed within 14 days of the discovery of the condition. SWPPP modifications must be completed within 14 days of the completion of the corrective action. In the case of a spill, fill out Appendix E – Spill Report in addition to this form.

If it is not feasible to complete the corrective action within 14 days, please describe the reason and proposed schedule for completion: _____

_____

_____

If corrective actions cannot be completed within 45 days of discovery, MEDEP must be notified.

Appendix D

Checklist: Annual Geotechnical Landfill Inspection

Table D-1
Checklist: Annual Geotechnical Inspection
2023 Annual Geotechnical Landfill Monitoring Report, Juniper Ridge Landfill, Old Town, Maine

Observation Date: 9/6/2023
Monitor Name: Richard E. Wardwell
Weather: mostly sunny, temperatures in mid 70's

Observation Area	Sat.	Unsat	Description (location, direction, appearance, etc.)	Proposed Action
Active Area				
location description	-	-	Cell 14 and Cell 15 (photos #10-14, 16-21, 30, 46);	n/a
slope stability	X			
waste lift thickness	X			
active slope angle	X		~2½:1 to 3:1	
erosion	X		none observed (N/O)	
leachate breakout	X		(N/O)	
ponded water	X		N/O	
toe heaving	X		N/O	
overall condition	X		stable slope appearance	
Inactive Area (Synthetic)			Synthetic Interim Cover Material (SICM) over most slopes	
location description	-	-	except lower west slope	n/a
slope stability	X		isolated surface bulge associated with SICM anchor	
cracking	X		N/O	
erosion	X		N/O	
leachate breakout	X		N/O	
ponded water	X		N/O	
toe heaving	X		N/O	
overall condition	X		stable SICM slope appearance (see Photos #1-14, 17-29, 33-41, 44, 47-53)	
Interim Soil Cover				
location description	-	-	lower westerly slopes	n/a
overall surface condition	X		good grass/soil cover (see Photos #31-35, 40-43)	
cracking	X		N/O	
erosion of cover materia	X		N/O	
erosion of ditch linings	X		N/O	
leachate breakout	X		N/O	
ponded water	X		N/O	
toe heaving	X		N/O	
grass kills	X		N/O	
gas venting	X		N/O	
overall condition	X		good stable condition (see Photos #31-35, 40-43)

Subject: Update of Opinion of Capital Closure and Post-Closure Costs
Calendar Year 2024
Juniper Ridge Landfill
Old Town, Maine

Dear Jeffrey:

As requested by NEWSME Landfill Operations LLC (NEWSME), Sevee & Maher Engineers, Inc. (SME) has updated our opinion of capital closure and post-closure costs for the Juniper Ridge Landfill (JRL) in Old Town, Maine for calendar year 2024. The capital closure cost is for those cells that, as of the end of the calendar year 2023, have been constructed, but have not received final cover. Constructed cells include Cells 1 through 15; closure includes 9 acres of the Stage 1 Closure Cap. In total, these landfill cells have approximately 97.3 acres of area requiring future closure. Our opinion of the capital closure cost to close the remaining 97.3 acres is $35,883,100. This cost is based on a per-acre closure cost presented in Table 1, for a final cover consistent with the final waste grades and cover components requirements of Maine Department of Environmental Protection (MEDEP) Solid Waste Management Rules (SWMRs).

The post-closure monitoring and maintenance cost for the site is $32,427,300 for the items presented in Table 2. The post-closure costs assume a 30-year post-closure period and are based on 2024 dollars.

Our opinion of closure and post-closure costs is based on the following assumptions.

1. The closure of the individual cells will consist of placing final cover over the areas of the developed landfill which have not received final cover. Note that operational costs such as placement and removal of intermediate cover, and operational waste grading are not included in the final cover costs presented herein. The cost to install an active gas collection system as part of closure is included. It is assumed that the current systems will continue to operate during the post-closure period.
2. The final cover of these cells will consist of the components as proposed in the Stage 1 and Stage 2 Final Cover design reports, which are consistent with the current SWMRs. SME's opinion of closure costs is based on our current understanding of site conditions and unit costs as bid in February 2024 for NEWSME's Stage 2 Final Cover project which reflect cover construction on 2.5H to 1V and 3H to 1V sideslopes.

3. The post-closure costs include landfill inspection, water quality monitoring, leachate management, general site maintenance, gas treatment and maintenance, and engineering for the entire facility. These post-closure costs are based on our current understanding of site conditions, and projections of both leachate and landfill gas quantity and quality, and costs associated with treatment and disposal. Actual post-closure costs will vary and are dependent upon the actual nature of site conditions at the time of closure, long-term management decisions of NEWSME and the Regulators, and other factors not evident at this time.

If there are any questions concerning our opinion of costs presented in this letter, please feel free to contact us.

Sincerely,

SEVEE & MAHER ENGINEERS, INC.

Lisa Turner, P.E., L.S.S.
Project Manager

TABLE 1

OPINION OF FINAL COVER COSTS FOR JUNIPER RIDGE LANDFILL
DEVELOPED LANDFILL AREA
AS OF DECEMBER 2023

JUNIPER RIDGE LANDFILL PER-ACRE FINAL COVER COSTS (GAS COLLECTION NEEDED)				
ITEM	UNIT	QUANTITY	UNIT COST[(1)]	TOTAL
Mobilization	L.S.	1	$18,600	$18,600
Erosion Control	L.S.	1	$13,700	$13,700
Active Gas System	L.S.	1	$24,300	$24,300
Site Grading of 6" Bedding Sand	C.Y.	810	$29.50	$23,895
12" Compacted Till	C.Y.	1,620	$27.00	$43,740
Geosynthetic Clay Liner	SQ.FT.	43,560	$0.89	$38,770
40-mil Textured Geomembrane	SQ.FT.	43,560	$0.75	$32,670
250-mil Drainage Geocomposite	SQ.FT.	43,560	$0.72	$31,410
18" Vegetative Cover	C.Y.	2,430	$26.00	$63,180
Seed & Mulch	L.S.	1	$17,200	$17,200
Engineer/Const. Monitoring	L.S.	1	$27,800	$27,800
			Total	$335,265

Notes:
1. Unit costs based upon Third Party Construction Cost (Stage 2 Final Cover bid dated February 2024).

	Acres	Closure Cost
Total Area of Cells 1-17	121.5	
Area of Cells to be constructed (16 & 17)	-15.2	
Area of completed fnal cover	-9.0	
Total area requiring final cover	97.3	$ 32,621,000
10 Percent Contingency		$ 3,262,100
TOTAL		**$ 35,883,100**

TABLE 2

OPINION OF POST-CLOSURE MONITORING AND MAINTENANCE COSTS FOR JUNIPER RIDGE LANDFILL
DEVELOPED LANDFILL AREA AS OF DECEMBER 2023

ITEM	OPINION OF AVERAGE YEARLY COSTS	TOTAL COST FOR 30 YEAR PERIOD	ASSUMPTIONS
Leachate Collection, Transport and Disposal			
A. Electrical Costs to Operate Pump Stations	$ 1,900	$57,000	Assumes a 15 hp (75 percent efficiency) pump pumping for 765 hours per year with electrical costs of $0.18 /kWhr.
B. Disposal Costs for Leachate Years 1-30	$ 584,430	$17,532,900	Leachate generation is estimated for a 30 year period beginning with 26.5 Million gallons at year 1 and decreasing to 0.40 Million gallons at year 30. Transportation cost of $0.0248/gal and disposal cost of $0.075/gal.
C. Annual Leachate Testing	$ 8,000	$240,000	Annual cost for pretreatment testing.
	Subtotal	**$17,829,900**	
Post Closure Water Quality Monitoring			
A.1 Sample methane and detection parameters at 24 Wells, 11 Underdrains, 2 Leachate Collection, 1 Leak Detection, 7 Surface Waters and 3 Pore Waters for three rounds.	$ 44,100	$220,500	Assumes three rounds of monitoring for detection parameters for years 1-5.
A.2 Sample methane and detection parameters at 24 Wells, 11 Underdrains, 2 Leachate Collection, 1 Leak Detection, 7 Surface Waters and 3 Pore Waters for two rounds.	$ 29,400	$147,000	Assumes two rounds of monitoring for detection parameters for years 6-10.
A.3 Sample methane and detection parameters at 24 Wells, 11 Underdrains, 2 Leachate Collection, 1 Leak Detection, 7 Surface Waters and 3 Pore Waters for one round.	$ 14,700	$294,000	Assumes one round of monitoring for detection parameters for years 11-30.
B.1 Analyses of 52 Samples 3 Times per Year	$ 60,300	$301,500	Assumes 24 wells,11 underdrains, 2 leachate collection, 1 leak detection, 7 surface, 3 pore water and 4 QA/QC, for years 1-5.
B.2 Analyses of 52 Samples 2 Times per Year	$ 40,200	$201,000	Assumes 24 wells, 11 underdrains, 2 leachate collection, 1 leak detection, 7 surface, 3 pore water and 4 QA/QC, for years 6-10.
B.3 Analyses of 52 Samples 1 Time per Year	$ 20,100	$402,000	Assumes 24 wells, 11 underdrains, 2 leachate collection, 1 leak detection, 7 surface, 3 pore water and 4 QA/QC, for years 11-30.
C. Compile Data and Submit to MEDEP	$ 5,400	$162,000	Assumes report prepared and submitted to MEDEP after each sampling round.
Annual Cost Years 1-5	$ 109,800		
Annual Cost Years 6-10	$ 75,000		
Annual Cost Years 11-30	$ 40,200		
	Subtotal	**$1,728,000**	
Landfill Inspection			
A. Monthly Site Walk & Report Generation	$ 6,273	$188,200	Assumes 9 hr., quarterly inspections @ $170/hr.
Subtotal	**$ 6,273**	**$188,200**	
Active Landfill Gas Extraction System - Annual basis, years 1-30			
A. Gas Collection Equipment Replacement	$ 12,200	$366,000	General equipment replacement including well heads, condensate pumps etc.
B. Flare Maintenance	$ 6,300	$189,000	Replacement of flare parts such as flame arrestor media etc.
C. Blower Maintenance	$ 6,300	$189,000	Routine inspection and maintenance of blower & control system.
D. System Operation and Inspection	$ 6,000	$180,000	General system operation & maintenance.
E. Well Tuning	$ 12,400	$372,000	Well tuning once per month.
F. Compliance Monitoring and Reporting	$ 20,900	$627,000	Includes Compliance Air Monitoring and Reporting.
G. Electrical Costs to Operate Blowers, Heat & Control Panel Years 1-30	$ 79,000	$2,370,000	Electricity for blowers assumes varying horsepower requirement as gas decreases @$0.18/kWhr.
H. Landfill Gas Treatment Costs Years 1-30	$ 115,000	$3,450,000	Includes treatment cost for H2S removal to 1,000 ppm using Thiopaq system at a cost of $2,200 per ton.
Subtotal	**$ 258,100**	**$7,743,000**	
Landfill Maintenance			
A. Cover Maintenance Including Annual Mowing & Erosion Repair	$ 9,500	$285,000	Assumes 3 man crew 10 days/ year.
B.1 Pump Stations Inspections	$ 14,040	$421,200	Assumes 4.5 hr./ week @ $55 per hour.
B.2 Pump Replacement Every Five Years (Not Annual Cost)	$ 42,000	$252,000	Assumes replacing 15 on-site pumps every 5 years at $3,000 a piece.
C. General Site Maintenance	$ 10,000	$300,000	Assumes snow plowing 20 storms per year @ $500 per storm.
D. Leachate Line Cleaning	$ 30,000	$600,000	Assumes leachate line cleaning once per year for years 1-10, then every other year, for years 11-30.
Subtotal	**$ 105,540**	**$1,858,200**	
Professional Services			
A. Engineering Services	$ 4,400	$132,000	General Services
Subtotal	**$ 4,400**	**$132,000**	
Subtotal		**$ 29,479,300**	
10% Contingency		**$ 2,948,000**

MSW Diversion

JRL 2023 Annual Report

Compliance with Condition 5 of #S-020700-WD-BC-A

(Casella MSW Landfilling Diversion)

Best efforts by Casella to divert MSW from landfilling at JRL to the greatest extent practicable:

5.A: A list and description of all diversion options evaluated and/or pursued by Casella, including currently operating Maine waste-to-energy facilities as options:

Diversion of MSW through Recycling

1. Casella's Zero-Sort program delivering MSW recyclables collected in Maine to the Casella processing facility in Lewiston.
2. Casella's cardboard recycling program wherein source separated cardboard is collected, baled, and marketed to end use recyclers.
3. Operation of the Casella Zero-Sort processing facility in Lewiston, Maine. Outreach to municipalities and businesses to encourage participation in Casella's Zero-Sort recycling program.

Diversion of MSW to Maine Incinerators and Processing Facilities

ecomaine:

Casella's Pine Tree Waste hauling companies collect and deliver Maine MSW and recycling materials to the ecomaine incinerator and single stream recycling facility.

MMWAC:

Casella's Pine Tree Waste hauling companies collect and deliver Maine MSW to the MMWAC incinerator.

PERC:

In 2020 an agreement was reached with PERC to annually deliver at least 100,400 tons of Maine MSW. Delivering additional Maine MSW is allowable if necessary. This is a good portion of the expected annual throughput of the PERC facility plans to accept.

COASTAL RESOURCE MANAGEMENT:

In 2018 an agreement was reached with CRM to deliver 40,000 tons annually of Maine municipal solid waste to CRM's recycling and processing facility in Hampden, in addition to deliveries of collected material from Municipal Review Committee (MRC) communities by Pine Tree Waste. The facility hasn't operated since May of 2020.

SWAP AGREEMENT:

A collective agreement was reached between Pine Tree Waste, Inc., NEWSME Landfill Operations, LLC, Waste Management Disposal Services of Maine, Inc., Municipal Review Committee, Inc., and Coastal Resources of Maine, LLC, pursuant to which bypass MSW collected from some MRC communities, primarily within the greater Bangor area, would be delivered to JRL rather than being delivered to the Crossroads Landfill, and an equivalent amount of MSW originating in Maine that otherwise would be delivered by Pine Tree to JRL would instead by delivered by Pine Tree to the Crossroads Landfill.

Diversion by Disposal at Other Landfills

Casella's Pine Tree Waste hauling companies (Bethel, Columbia, Fairfield, Hermon, Houlton, Mechanic Falls, Old Orchard Beach, Sanford, Scarborough, Waterville, and West Bath) collect Maine MSW and deliver to landfills other than Juniper Ridge: Bath, Brunswick, Fort Fairfield / Presque Isle (RWS), and Norridgewock, Maine, Lawrence Station, New Brunswick, and Berlin, New Hampshire.

5.B: A narrative detailing the specific efforts made by Casella to implement diversion options:

See narrative description in 5.A above.

5.C: A narrative describing the results of Casella's evaluation/pursuit of MSW diversion options, including the volume of waste and diversion destination of MSW successfully diverted and/or the specific reasons that MSW was not diverted to other destination options.

Maine MSW Recyclables Delivered to Casella Zero-Sort in Lewiston, ME

- Number of Maine municipalities participating in Casella's Zero-Sort program in calendar year 2023: 49
- Number of Maine businesses participating in Casella's Zero-Sort program in calendar year 2023: approx. 3,251
- Tons of Maine MSW recyclables processed in Casella's Zero-Sort program in calendar year 2023: 22,925 tons

Casella cardboard recycling

Fiber brokered and baled directly from Maine municipalities or Maine businesses in calendar year 2023:

- Brokered: 54,578 tons
- Baled: 16,485 tons

Maine MSW Delivered to Maine Incinerators and Processing Facilities in 2023

ecomaine:

- Single-stream recyclables: 14,830 tons
- MSW: 64,852 tons

MMWAC:

- Lewiston Zero-Sort processing residue: 101 tons
- MSW: 38,026 tons

PERC:

- MSW: 120,911 tons

CRM:

- MSW: 0 tons

Maine MSW Delivered to Landfills Other than Juniper Ridge in 2023

Bath Landfill:

- MSW: 1,389 tons

Brunswick Landfill:

- MSW: 0 tons

Fort Fairfield / Presque Isle Landfill (RWS):

- MSW: 10,704 tons

Norridgewock Landfill:

- MSW: 57,603 tons

Southwest New Brunswick Service Commission (Lawrence Station, NB):

- MSW: 6,914 tons

Total Maine MSW diverted from disposal at JRL in 2023 through efforts described above

- 395,396 tons

Total Maine, non-bypass MSW disposed at JRL in 2023

- 0 tons
