

SECTION 16: Water Supply

Water supply for the site will be derived from groundwater sources via newly developed wells. Water use will include for potable water purposes, as well as support for the facility operations and product processing.

As part of the investigations into the suitability of the property, Kingfish Maine retained Woodard & Curran to plan the development of new wells. These wells were installed in Fall 2020. Subsequent pump testing was performed to identify possible yields and drawdown.

Based on the assessed drawdowns and determination of acceptable yield, planning was initiated to utilize a sidestream of treated seawater from the seawater intakes to reduce the demand on the groundwater.

Anticipated flows for domestic demand are readily supported by the installed well system, as they represent a continuous withdrawal of <4 gpm. Additional freshwater to support the plant operations are also required and will be withdrawn to the determined limits outlined in the hydrogeological assessment.

Appended to this section is the hydrogeologic investigation of the planned use of the groundwater supply.

1. INTRODUCTION

This hydrogeological report has been developed in support of Site Location of Development (SLOD) permitting activities being conducted at the proposed Kingfish site (Site) located in Jonesport, Maine. The site location and surrounding area are provided in Figure 1. In general, the Site is in a sparsely populated rural region located approximately 2 miles northeast of the Jonesport town center.

The project Site is located on approximately 93 acres of land between Route 187 and the waters of Chandler Bay. Figure 2 depicts the boundaries of the Site and mapping completed to date. In general west and north of the site are large, forested wetlands and heaths with surface drainage running to the east and west creating a surface water divide immediately west of the site.

2. GEOLOGY

The regional geology and Site geology are described in this section. The regional studies that provided background data for the area included surficial geologic studies, bedrock geologic studies, and a regional lineament analysis completed by the State and summarized herein. Results of on-Site bedrock drilling are also discussed and presented.

2.1 Surficial Geology

The site is largely characterized by a shallow mantel of overburden soils on top of bedrock. Overburden thicknesses in the region (from casing depths and drill logs from S.W. Cole) vary from less than 1 foot to as much as 50 feet below the ground surface. On-site overburden typically is between 5 and 15 feet thick with a water table depth approximately 3 to 9 feet below the ground surface. The groundwater surface appears to be a subdued reflection of site topography. Overburden materials consist of thin veneers of glacio-fluvial fine silts and sand on top of glacial till. Hydraulic conductivities of this material (as evident from the grain size distribution data collected by S.W. Cole) and available water in the surficial deposits make the development of a surficial groundwater source very unlikely at the required demands for the facility.

2.2 Regional Bedrock Geology

Figure 3 (Regional Bedrock Mapping) depicts the bedrock geology of the region. The mapping shows metasedimentary rock that were created during two different pluton intrusions. The first was the Jonesport Gabbro and the second was the Great Wass Granite. The Great Wass Granite intruded Gabbro along fracture planes internal to the Gabbro. These fracture planes are very steeply dipping and can create zones of high bedrock conductivities (refer to Figure 2). The two intrusive bodies created a brecciated zone along the contact with the metasedimentary rock to the north of the site. The intrusive bodies folded and faulted the country rock to the north of the brecciated zone. Several mapped faults also exist in the region.

As depicted in Figure 3, the site is entirely in the brecciated zone surrounding the two plutons to the west and south and the metasedimentary rock to the north. The brecciated zone along the contact of the plutons consist of blocks schist, metasedimentary rock, primarily Silurian volcanics all cut by gabbro, and diabase veins and dikes. In simple terms the rock in this zone has been significantly reworked from the intrusive rocks and could lend itself to zones of high hydraulic conductivity.

2.3 Photo Lineament Data

A large-scale Photo Lineament Study was done by the State where stereo pairs were used to detect geomorphologic linear patterns that could be associated with fracturing and faulting of the underlying bedrock. Figure 4 (Photo Lineaments) superimposes the local lineaments on the Site location map. These lineaments are the surface expression of what may be large scale fracturing and faulting of the bedrock below. These features, if associated with fracturing, are likely to be steeply dipping which make it difficult to intersect using shallow depth borings.

2.4 Local Bedrock Well Data

Figure 5 (Local Bedrock Wells) shows the depth and yield of the local bedrock wells surrounding the site. Locally there are several bedrock wells. These wells are at various depths and typically drilling stopped when the required water supply from the well met or exceeded the demand for the well. These wells are all residential wells, so it is assumed that when greater than 5 gpm was achieved, the drilling stopped.

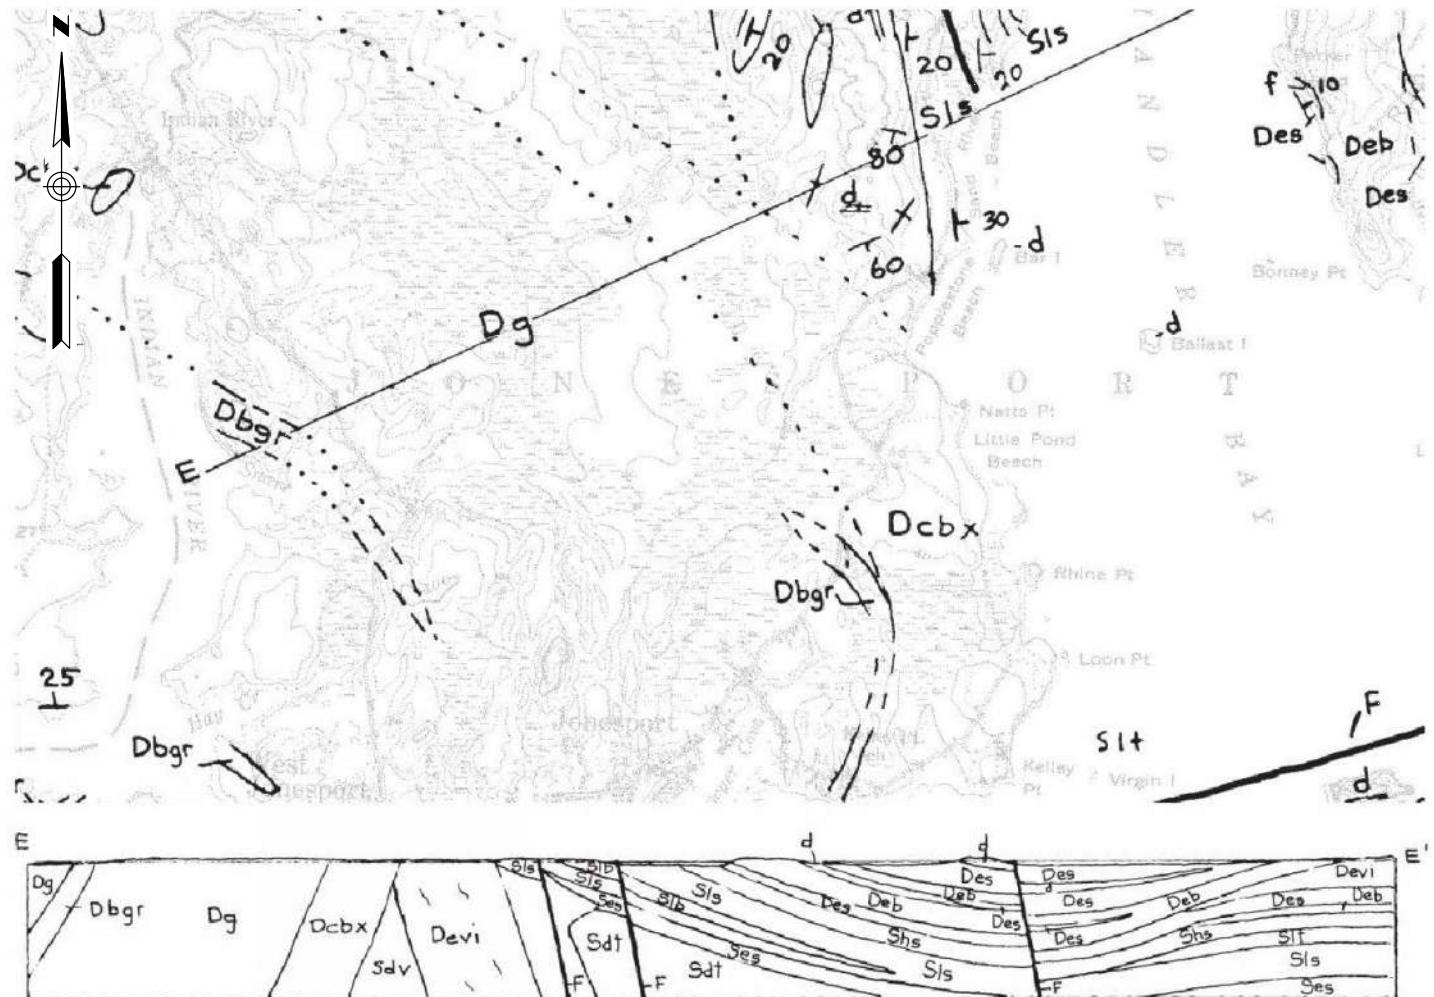

Many of the wells produce between 5 and 10 gpm; two high producing wells along Route 187 north of the village are somewhat coincident with the photo lineaments depicted in Figure 4 and yield >100 gpm and 50 gpm, respectively. Most wells are between 100 and 250 feet deep. All fracture planes and faulting are steeply dipping creating variability in depth to fracture planes.

The bedrock geology, photo lineaments (although large scale) combined with the large basically undeveloped overburden recharge offer a reasonable opportunity to develop the bedrock aquifer on the site. A bedrock drilling program was conducted to evaluate the potential for groundwater supply development.

2.5 Site Bedrock Drilling

Prior to initiating subsurface activities, Woodard & Curran pre-marked investigations location and coordinated with Dig Safe for utility clearance. No proposed well locations were relocated due to utility interferences.

A total of 5 wells were installed by Shannon Well Drilling on October 20, 21, 22, 23 and 24, 2020. All wells were completed with a six-inch air rotary drill, advanced directly into bedrock. No overburden sampling or observations were completed. Well locations (Well 1, Well 2, Well 3, Well 4 and Well 5) were chosen based on known Site geology, with a focus on alignment with photo lineaments. Well locations are shown in Figure 6. Well depth ranged from 220 to 360 feet below ground surface (bgs). Wells depths were selected based on drill speed, fracture observations and intermittent rating of well capacity. Observations during well installation such as drill speed, slurry contents, salinity, well rating and observed geology were recorded by Woodard & Curran and are included in the boring logs attached as Appendix A.

PLUTONIC IGNEOUS ROCKS

- Dbgr** Pink two-feldspar biotite granite. Locally has mantled k-feldspar.
- Dhgr** Hornblende-bearing biotite granodiorite and quartz monzonite. Locally has granophytic texture.
- Ds** Perthite, aegerine-augite, quartz syenite.
- QP** Pink quartz porphyry dikes.
- Dg** Gabbro and ferrogabbro. Locally layered. Cut by veins and dikes of diorite.
- Dcbx** Contact breccia along margins of large gabbro plutons. Blocks of schist, Silurian volcanic and sedimentary rocks, gabbro and diabase. Cut by gabbro and granite veins and dikes.

VOLCANIC, HYPABYSSAL, AND SEDIMENTARY ROCKS

- SILURIAN**
- d** Diabase and gabbro dikes, sills, and irregular small plutons. Silurian and Devonian. Emplaced during volcanism and also during and after Devonian plutonism.
- EASTPORT FORMATION**
- Devi** Rhyolitic flow banded devitrified vitrophyre and autobreccia. Intruded along a fault bordering the Machias Syncline and into the Pembroke and Eastport Formations within the syncline.
- Deb** Basalt and basaltic andesite flows and shallow intrusions into soft muds and tuffs.
- Debt** Basaltic tuff-breccia and coarse bedded tuffs.
- Det** Rhyolitic tuff-breccia and coarse bedded tuffs.
- Des** Shale, siltstone, and fine-grained bedded tuffs. Gray and maroon. Ostracodes, pelecypods, and linguloids.
- KERSEY FORMATION**
- Sh** Maroon, green, and gray shale and siltstone. Local limestone lenses and tuffs. Ostracodes, pelecypods, and gastropods.
- LEIGHTON FORMATION**
- Sib** Basalt flows.
- Slt** Basaltic and rhyolitic tuff-breccia and coarse-bedded tuffs.
- Sis** Gray shale, siltstone, and fine-grained bedded tuffs.
- EDMUND'S FORMATION**
- Seb** Basalt flows.
- Set** Mixed basaltic and rhyolitic tuff-breccias and coarse bedded tuffs. Gray, green, and maroon. Locally contain beds of maroon siltstone and fine-grained tuff.
- Sev** Pink porphyritic intrusive vitrophyre.
- Ses** Gray shale, siltstone, and fine-grained bedded tuffs. Brachiopods, trilobites, and orthoceroids.

3. HYDROGEOLOGY

The Site hydrogeology was investigated by completing a phased pumping test in the wells installed on-site. The data from the pumping tests were reduced and interpreted to estimate potential yields from the site and to develop hydrogeologic parameters for the bedrock aquifer. The pumping test, data reduction, and data analyses are discussed in this section.

3.1 Pumping Test

A pumping test was conducted on wells installed as described in the preceding section. The pumping test was conducted between January 6 and January 11, 2021. The pumping test consisted of a sequenced, combined pumping test of Wells 5, 4, and 1. During this pumping test, Wells 2 and 3 were used to monitor drawdown. Additionally, groundwater levels were monitored via vented, automated data loggers in two nearby domestic wells, designated as P-West and P-East on Figure 5 for the purposes of this report, and an overburden well shown on Figure 6.

Figure 7 depicts the groundwater levels in the primary wells monitored at the site during the pumping test. Vertical lines indicate start times for the pumps in each of the wells pumped during the test. Pumping was initiated in Well 4 first, followed by Well 1 approximately three hours later, and finally by Well 5 approximately 2.75 hours after pumping started at Well 1. Initial fluctuations in pumping rates and in drawdown responses were due to adjustments in gate valves necessary to achieve a stabilized pumping rate. Average pumping rates are provided in the table below. The combined average pumping rate was approximately 85 gallons per minute (gpm).

Table 1: Average Pumping Rates during Pumping Test

Well Identification	Average Pumping Rate (gpm)
Well 1	10
Well 4	36
Well 5	39

Approximately five hours before the pumping test was shut down, the pumping rate in Well 1 was increased to approximately 30 gpm. Prior to this increase (the initial phase), water levels in the pumping wells and in the adjacent monitoring wells had generally reached a stabilized condition. The responses observed in pumping Wells 1 and 4 and monitoring Well 3 positioned between Wells 1 and 4 suggest that these wells are likely located along interconnected fractures. The lack of immediate response in Well 5 and Well 2 to pumping changes in Wells 1 and 4 suggest that these wells are in a different set of fractures. Drawdowns at the end of the second phases of the pumping test are indicated in the table below.

Table 2: Drawdowns Measured during Pumping Test

Well Identification	Drawdown Initial Phase (feet)	Drawdown End of Second Phase (feet)
Well 1	42.39	95.03
Well 2	57.12	58.41
Well 3	38.62	56.79
Well 4	104.92	120.73
Well 5	154.21	156.19
P-West	5.90	7.17
P-East*	-0.12	-0.12
SW Cole Overburden Well	1.85	2.36

Note: P-East is adjacent to the shoreline and experiences tidal fluctuations. Negative drawdown likely indicates rise in nearby tidally influenced bay.

3.2 Pumping Test Analysis

Pumping test data were analyzed using AquiferWin32 version 5.03, a pumping test curve-matching analysis package developed by Groundwater Simulations, Inc. The field data were reduced to elapsed time and drawdown prior to being imported into the analysis software. Curve matches for each analysis are provided in Appendix B to this report. Due to the variability in pumping rates during the pumping test, the recovery data from the pumping wells were analyzed to estimate properties for the aquifer at the pumping well locations. Both pumping and recovery data were analyzed for the observation wells; therefore, the results for these wells are presented as a range. A summary of the aquifer properties estimated from the analyses of the pumping test data are provided in the table below. For the purposes of these analyses, an aquifer thickness of 500 feet was assumed for the bedrock aquifer. Relatively large fractures were observed at depths greater than 300 feet and the aquifer thickness was simulated at 1.5 times observed fractures. A sensitivity analysis was done on thicknesses between 350 and 500 feet with little variation in the results.

Based on the recovery data and drawdown observed in the overburden well, the recovery data for the pumping wells best matched the curves for a confined aquifer with a leaky confining layer. In some cases, data were matched using a linear approximation (Cooper Jacob, 1946) available in the software package. In general, calculated aquifer hydraulic conductivity ranged between 0.03 and 0.21 feet/day. Storage coefficients varied by several orders of magnitude between approximately 4×10^{-7} to 1.6×10^{-1} . The upper end of this range was calculated using the early time data from pumping of Well 1 and may not be representative due to the potential for casing storage effects present in the drawdown. A realistic number for the bedrock storage coefficient is within the 10^{-3} to 10^{-7} range.

Table 3: Summary of Hydrogeologic Properties Evaluated from Pumping Test

Well Identification	Transmissivity (feet ² /day)	Hydraulic Conductivity (ft/day)	Storage Coefficient (unitless)
Well 1	41 - 93	0.08 – 0.19	$9.89 \times 10^{-2} – 1.6 \times 10^{-1}$
Well 2	79 - 103	0.16 – 0.21	$1.88 \times 10^{-5} – 4.80 \times 10^{-5}$
Well 3	36 - 43	0.07 - 0.09	$1.89 \times 10^{-5} – 3.11 \times 10^{-5}$
Well 4	70	0.14	4.10×10^{-2}
Well 5	17	0.03	3.77×10^{-7}

The above data ranges for hydraulic conductivity and storage coefficient were used in the development of a groundwater flow model discussed in Section 4.

3.3 Water Quality Sampling and Results

Water quality samples were collected from Wells 1, 4 and 5 at the end of the pumping test. In general, water quality was good in each of the three wells tested. Trace detections of chloroform were detected in Well 1 and Well 5. A trace detection of toluene was detected in Well 1. These detections were well below the regulatory standards for both compounds. Arsenic above the USEPA Maximum Contaminant Level (MCL) was detected in Well 5. Full analytical reports are included in Appendix C of this report.

Table 4: Summary of Detections from Water Quality Testing

Analyte	Unit	Regulatory Limit	Well 1	Well 4	Well 5
<i>Organics</i>					
Chloroform	ug/L	100	2.7	ND	1.3
Toluene	ug/L	600	1.1	ND	ND
<i>Metals & Inorganics</i>					
Arsenic	mg/L	0.01	0.0098	0.003	0.0288

4. GROUNDWATER MODEL

A groundwater flow model was developed for the Site to assist in evaluation of the potential effects of aquifer pumping. The development of the model and its subsequent use in evaluating the water supply capabilities of the bedrock aquifer are discussed in the following section. Since the Site had thin and limited overburden for developing a water supply, the groundwater flow model does not explicitly simulate the overburden.

4.1 Model Selection

The groundwater model code selected for the modeling exercise was MODFLOW 2005, by the United States Geological Survey (USGS). This is an updated version of the original MODFLOW developed by USGS in 1988. The MODFLOW family of codes is an industry standard for modeling groundwater flow in porous media. In this case, MODFLOW is being used to simulate conditions in bedrock in an equivalent porous media framework. In such cases, the assumptions are that the bulk characteristics of the fractured media may be simulated using MODFLOW at an appropriate scale. Given the objectives to simulate potential effects of water withdrawals on nearby potentially sensitive water dependent users (i.e. nearby wetlands and domestic wells), MODFLOW2005 allows for evaluation of water withdrawal effects via calculation of water balances and simulation of drawdown resulting from aquifer pumping.

4.2 Model Domain, Grid and Boundary Conditions

The groundwater model domain, grid, and boundary conditions are depicted on Figure 8. The grid was initially set to a nominal row and column spacing of 100 feet. This grid spacing was refined at the site to better simulate the proposed groundwater supply extraction. The finest grid spacing used is 25 feet by 25 feet on the Site. The top of the model was set at 50 feet. The bottom of the model was set at -450 feet. This allows for the assumed aquifer thickness of approximately 500 feet to be used for the simulation.

The external boundary conditions consist generally of no-flow boundaries on the north, south, and west sides of the model space. These no-flow boundaries are set in areas where groundwater flow is assumed to be parallel to the boundary and therefore flow neither enters nor leaves the model space. The eastern boundary condition is the water of Chandler's Bay and is simulated with a constant head boundary set at an average tidal level of approximately 7 feet. The internal boundary conditions used to simulate the various bogs, heaths, and wetlands and channels between these areas are simulated with drains. Drains remove water from the model based on a specified elevation generally set to close to the surface elevation. Drains continue to discharge if the groundwater elevation remains higher than the drain. Once the groundwater elevation drops below the specified drain elevation, water ceases to flow unless and until the water elevation rises above the drain bottom. Groundwater flux through the drains allows us a means of estimating surface flow and impacts to the wetland areas surrounding the Site.

The groundwater model was setup with three stress periods. The first stress period simulates long-term steady state conditions prior to any pumping activity. The second stress period consisted of three days used to simulate the portion of the pumping test conducted prior to increase of pumping in Well 1. The final stress period was used to simulate the effects of long-term pumping at the combined average rate used in the pumping test.

4.3 Model Properties

The primary model properties used in the simulation of flow at the Site were recharge, hydraulic conductivity, and storage coefficient. Recharge was set at approximately 0.0027 ft/day (equivalent to 12 inches/year) over much of the model space to reflect the relatively flat area with limited surface drainage features other than the modeled wetland areas. To simulate the increased recharge likely occurring underneath the large, closed heath that drains a large portion of the upland area located adjacent to the Site, approximately 0.0083 ft/day (36 inches/year) of recharge was added to represent this closed collection point in the hydrologic system. Model hydraulic conductivities were adjusted

within the range of calculated values determined from the pumping test discussed in the previous sections to achieve a reasonable match to observed drawdowns at the end of the initial phase of the pumping test. To calibrate the model the final hydraulic conductivity used was 0.13 feet/day which is near the midpoint of the calculated values. The value of storage used in the model was set to 10^{-5} which is in the midpoint range of the observed data.

4.4 Model Calibration

The steady groundwater flow field predicted by the steady state model is shown in Figure 9. The calibrated model generally was able to replicate the observed drawdowns. The model predicted drawdowns are somewhat higher than the measured drawdowns in the various wells. Some of this discrepancy is likely due to grid squares in the model being larger than the point locations of the wells and therefore some averaging occurs over that area compared to a point value in a well. Additionally, the bulk characteristics simulated using an equivalent porous media model are not likely to capture all the nuances of a fractured rock setting. Small local variation in bedrock hydraulic conductivities and bedrock anisotropic conditions are largely responsible for these variations. Table 5 below provides a comparison of the observed value to the modeled value. Given that most values are slightly overpredicted, the conclusions made based on these values should be conservative. The modeled flow field at the end of the initial phase of the pumping test is depicted in Figure 10. Figure 11 depicts the drawdown contours at the end of the initial phase of the test. As expected, the largest drawdowns are centered around Test Wells 4 and 5 which had the largest pumping rates. Lower drawdown occurs around Test Well 3 and the nearby residential well P-West. As expected, there is no measurable drawdown at the P-East location proximal to the shoreline.

Table 5: Observed and Modeled Drawdowns Comparison

Well Identification	Observed Drawdown Initial Phase (feet)	Modeled Drawdown (feet)
Well 1	42.39	57.78
Well 2	57.12	49.42
Well 3	38.62	46.68
Well 4	104.92	107.12
Well 5	154.21	124.63
P-West	5.90	12.14

The overall model water balance at the end of the simulated pumping test is presented in Table 6 below. The water balance indicates a good match between overall inflows and outfalls with the error between the two much less than 1%. The majority of inflow occurs as recharge. The major outflows occur through the constant heads representing the shoreline and the wetland areas simulated as drains. The simulated pumping is the only other outflow and is lower overall than the other outflows.

Table 6: Groundwater Model Water Balance

Description	Inflow (cf/d)	Outflow(cf/d)
Recharge	109,447	-
Constant Head	-	28,305
Drain	-	67,406
Well	-	16,793
Storage	3,060	3
TOTAL	112,508	112,508

4.5 Model Predictive Runs

The calibrated flow model was used to evaluate drawdowns, water levels, and water balance considerations for withdrawals with the site wells set at approximately 90 gpm. The stress period for this simulation was run out to one year to approximate steady state conditions. The results of this simulation are depicted in Figures 12 and 13. As shown, the drawdown has deepened slightly at each of the wells and the nearby P-West well shows slightly more drawdown at around 13.7 feet. Given that this well has an overall depth of approximately 250 feet and that drawdowns are generally overpredicted compared to observed drawdowns, it is unlikely that this well would be significantly impacted.

Table 7 predicts potential effects on the adjacent heath from a water balance perspective. Flux rates were calculated by the model and summed by areas of the heath near the Site. Two additional simulations were completed to estimate heath impacts from both a 60 and 30 gpm steady state pumping conditions. Figures 14 and 15 depict the associated drawdown for each of the reduced pumping conditions. Based on the model simulations completed, heath impacts will be further reduced for steady state pumping conditions below 30 gpm.

The Eastern Heath refers to the portion of the heath north of the Site and east of Route 187. The Western Heath refers to the portion of the heath west of the Site and Route 187. During pumping, the flux rate is reduced to the heath as the water level begins to fall and the head difference driving flow to the heath and the area of the heath receiving discharging groundwater is reduced. While there is a predicted effect on both sides of the heath based on the model, the conceptualization of the heath as a simple drain may be overpredicting the overall effect. There are some unknowns in the hydrology of the heath that should be assessed to effectively evaluate the extent of the effect of pumping on the nearby receptors. Shallow overburden monitoring and stream gages data can be used to refine the model.

Table 7: Model Predictive Heath Fluxes

Modeled Scenario	Combined Pumping Rate	East Heath Flux		West Heath Flux	
	gpm	CFD	gpm	CFD	gpm
Steady State No Pumping	0	4,141	21.5	19,695	102
End of Test	90	276	1.4	13,515	70

5. SUMMARY AND RECOMMENDATIONS

The investigation has determined that wells installed at the Site are situated in the brecciated sedimentary rock zone associated with the Great Wass Granite and the Jonesport Gabbro. This unique setting allows for significant water production from the wells installed at the Site. The production rate and long-term sustainable yield determined during the pumping test was approximately 90 gpm. The groundwater modeling efforts indicated that production from the aquifer may potentially affect the heath adjacent to the Site by reduction in groundwater discharge to portions of the heath. The magnitude of the reductions likely related to the nature of the interconnectedness of the groundwater and surface water systems of the heath warrant additional monitoring. The groundwater modeling indicated heath impacts are reduced, as depicted in Figure 16 below, as pumping is reduced.

Figure 16 - Heath Flow as a Function of Pumping

The following recommendations for activities designed to measure and mitigate potential effects on the heath and adjacent domestic wells are summarized below.

- Install piezometers in the Eastern and Western portions of the Heath to monitor groundwater levels pre- and during production.
- Install a weir in the north stream or establish a gauging transect, stream gauge, and develop a rating curve for the stream flow exiting the Eastern Heath from the northeast corner and monitor flows both pre- and during production. This stream is the primary discharge stream for the heath.
- Either obtain long-term access for monitoring the P-West domestic well or install a bedrock monitoring well in the northwest corner of the Site to monitor long-term water levels in the bedrock aquifer.

The above proposed monitoring activities would allow for safe production from the bedrock aquifer through management of pumping or infiltrating site runoff to prevent adverse effects on the adjacent domestic wells and nearby natural resources.

It is suggested that criteria be established that sets ecological or hydrologic constraints on the site and monitoring implemented to ensure those constraints are met during pumping. It is suggested that Kingfish request a starting pumping rate of no more than 30 gpm (one third of the aquifer yield) and compare pre-pumping monitoring data with pumping data to make sure the site constraints (pass by flows, water table data, etc.) are met. If at that time the data supports increased pumping, Kingfish should be allowed to petition for approval to increase pumping based on actual data collected.

Lab Number: L2101121
Report Date: 01/26/21

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

January 26, 2021: This final report includes the results of all requested analyses.

January 18, 2021: This is a preliminary report.

Sample Receipt

L2101121-01: The collection date and time on the chain of custody was 08-JAN-21 12:45; however, the collection date/time on the container label was 08-JAN-21 12:40. At the client's request, the collection date/time is reported as 08-JAN-21 12:40.

Volatile Organics by Method 524.2

The WG1456061-6 MS recovery, performed on L2101121-01, is below the acceptance criteria for 1,1,1-trichloroethane (60%); however, the associated LCS recovery is within overall method allowances. The results of the native sample are considered to have a potentially low bias for this compound.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
NR	- No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: Data Usability Report

Project Name: KINGFISH PUMP TEST
Project Number: Not Specified

Lab Number: L2101121
Report Date: 01/26/21

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthrenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA, this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- F** - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.
- G** - The concentration may be biased high due to matrix interferences (i.e., co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- ND** - Not detected at the reporting limit (RL) for the sample.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where

Project Number: Not Specified

Lab Number: L2101121
Report Date: 01/26/21

Data Qualifiers

the identification is based on a mass spectral library search.

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at its own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
EPA TO-12 Non-methane organics
EPA 3C Fixed gases
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Shipper authorizes Uniship to deliver this shipment without obtaining a delivery signature.

Shipper's Signature

RECEIVED, subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents

and condition of contents of packages unknown), marked, consigned, and destined as indicated above which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property, under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of said property overall or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service to be performed hereunder shall be subject to all the bill of lading terms and conditions in the governing classification on the date of shipment.

Shipper hereby certifies that he is familiar with all the bill of lading terms and conditions in the governing classification and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

Laboratory Report

Alpha Analytical
8 Walkup Dr.
Westborough, MA 01581

Date Printed: 01/26/2021
Work Order #: 2101-00792
Client Job #: L2101121
Date Received: 01/09/2021
Sample collected in: Maine

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of the analyzing laboratory's Quality Assurance Plan, Standard Operating Procedures and State Accreditation. This certificate shall not be reproduced, except in full, without the written approval of the analyzing laboratory. The results presented in this report relate to the samples listed on the following pages in the condition in which they were received. Accreditation for each analyte is identified by the * symbol following the analyte name. Location of our analyzing laboratory is identified by the code in the Analyst Column.

A & L Laboratory:

Identified by ME in Analyst Column
155 Center Street, Auburn, Maine 04210
www.allaboratory.com

Granite State Analytical Services LLC:

Identified by NH in Analyst Column
22 Manchester Road, Derry, NH 03038
www.granitestateanalytical.com

ANALYSIS RELATED NOTES:

- RL: "Reporting limit" means the lowest level of an analyte that can be accurately recovered from the matrix of interest.
- A & L Laboratory / Granite State Analytical Services LLC. accreditation lists can be found on our websites listed above.
- Subcontracted samples will be identified by the Accreditation number of the subcontract laboratory in the analyst field for each analyte and the appropriate laboratory will be listed here. **This report contains data that were produced by a subcontracted laboratory accredited for the fields of testing performed.**
KNL Laboratory Services, 3202 North Florida Avenue, Tampa, FL 33603 Accreditation # FL00117
- Data Qualifiers (DQ) Flags provide additional information in regards to the receipt, analysis or quality control of a sample. These are indicated under the DQ Flags Column on your report and listed here if necessary: **Data Qualifier (DQ) Flags: H = Hold time non-compliant.**

SAMPLE STATE SPECIFIC NOTES:

- The thermal preservation requirement of 4°C for nitrate & nitrite has been waived by the Maine CDC for all samples submitted to the Drinking Water Program.
- The State of Maine requires the reporting of radon test results in accordance with the Act (22 MSRA sec. 771 et seq.). The following for all tests completed by A & L will be reported to the state on a monthly basis: address of the structure tested, radon result, and whether or not there is a mitigation system in place. A + symbol indicates State of Maine Radon Registration.
- The Maximum Exposure Guideline(MEG) for water radon in Maine is 4,000pCi/L

Additional Narrative or Comments: **None**

We appreciate the opportunity to provide you with laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be happy to assist you.

Laboratory Report

Alpha Analytical
8 Walkup Dr.
Westborough, MA 01581

Date Printed: 01/26/2021
Work Order #: 2101-00793
Client Job #: L2101121
Date Received: 01/09/2021
Sample collected in: Maine

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of the analyzing laboratory's Quality Assurance Plan, Standard Operating Procedures and State Accreditation. This certificate shall not be reproduced, except in full, without the written approval of the analyzing laboratory. The results presented in this report relate to the samples listed on the following pages in the condition in which they were received. Accreditation for each analyte is identified by the * symbol following the analyte name. Location of our analyzing laboratory is identified by the code in the Analyst Column.

A & L Laboratory:

Identified by ME in Analyst Column
155 Center Street, Auburn, Maine 04210
www.allaboratory.com

Granite State Analytical Services LLC:

Identified by NH in Analyst Column
22 Manchester Road, Derry, NH 03038
www.granitestateanalytical.com

ANALYSIS RELATED NOTES:

- RL: "Reporting limit" means the lowest level of an analyte that can be accurately recovered from the matrix of interest.
- A & L Laboratory / Granite State Analytical Services LLC. accreditation lists can be found on our websites listed above.
- Subcontracted samples will be identified by the Accreditation number of the subcontract laboratory in the analyst field for each analyte and the appropriate laboratory will be listed here. **This report contains data that were produced by a subcontracted laboratory accredited for the fields of testing performed.**
KNL Laboratory Services, 3202 North Florida Avenue, Tampa, FL 33603 Accreditation # FL00117
- Data Qualifiers (DQ) Flags provide additional information in regards to the receipt, analysis or quality control of a sample. These are indicated under the DQ Flags Column on your report and listed here if necessary: **Data Qualifier (DQ) Flags: H = Hold time non-compliant.**

SAMPLE STATE SPECIFIC NOTES:

- The thermal preservation requirement of 4°C for nitrate & nitrite has been waived by the Maine CDC for all samples submitted to the Drinking Water Program.
- The State of Maine requires the reporting of radon test results in accordance with the Act (22 MSRA sec. 771 et seq.). The following for all tests completed by A & L will be reported to the state on a monthly basis: address of the structure tested, radon result, and whether or not there is a mitigation system in place. A + symbol indicates State of Maine Radon Registration.
- The Maximum Exposure Guideline(MEG) for water radon in Maine is 4,000pCi/L

Additional Narrative or Comments: **None**

We appreciate the opportunity to provide you with laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be happy to assist you.

Rebecca L. Labranche
Laboratory Director

Laboratory Report

Alpha Analytical
8 Walkup Dr.
Westborough, MA 01581

Date Printed: 01/26/2021
Work Order #: 2101-00794
Client Job #: L2101121
Date Received: 01/09/2021
Sample collected in: Maine

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of the analyzing laboratory's Quality Assurance Plan, Standard Operating Procedures and State Accreditation. This certificate shall not be reproduced, except in full, without the written approval of the analyzing laboratory. The results presented in this report relate to the samples listed on the following pages in the condition in which they were received. Accreditation for each analyte is identified by the * symbol following the analyte name. Location of our analyzing laboratory is identified by the code in the Analyst Column.

A & L Laboratory:

Identified by ME in Analyst Column
155 Center Street, Auburn, Maine 04210
www.allaboratory.com

Granite State Analytical Services LLC:

Identified by NH in Analyst Column
22 Manchester Road, Derry, NH 03038
www.granitestateanalytical.com

ANALYSIS RELATED NOTES:

- RL: "Reporting limit" means the lowest level of an analyte that can be accurately recovered from the matrix of interest.
- A & L Laboratory / Granite State Analytical Services LLC. accreditation lists can be found on our websites listed above.
- Subcontracted samples will be identified by the Accreditation number of the subcontract laboratory in the analyst field for each analyte and the appropriate laboratory will be listed here. **This report contains data that were produced by a subcontracted laboratory accredited for the fields of testing performed.**
KNL Laboratory Services, 3202 North Florida Avenue, Tampa, FL 33603 Accreditation # FL00117
- Data Qualifiers (DQ) Flags provide additional information in regards to the receipt, analysis or quality control of a sample. These are indicated under the DQ Flags Column on your report and listed here if necessary: **Data Qualifier (DQ) Flags: H = Hold time non-compliant.**

SAMPLE STATE SPECIFIC NOTES:

- The thermal preservation requirement of 4°C for nitrate & nitrite has been waived by the Maine CDC for all samples submitted to the Drinking Water Program.
- The State of Maine requires the reporting of radon test results in accordance with the Act (22 MSRA sec. 771 et seq.). The following for all tests completed by A & L will be reported to the state on a monthly basis: address of the structure tested, radon result, and whether or not there is a mitigation system in place. A + symbol indicates State of Maine Radon Registration.
- The Maximum Exposure Guideline(MEG) for water radon in Maine is 4,000pCi/L

Additional Narrative or Comments: **None**

We appreciate the opportunity to provide you with laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be happy to assist you.

Rebecca L. Labranche
Laboratory Director

FL DOH Certification #E84025
ME Lab ID FL00117

Report Date: January 15, 2021

A & L Laboratory
155 Center St., Bldg C
Auburn, ME 04210

Field Custody: Client
Client/Field ID: 2101-794-4
Sample Collection: 01-08-21/1345
Lab ID No: 21.555
Lab Custody Date: 01-13-21/1025
Sample Description: DW

CERTIFICATE OF ANALYSIS

Parameter	Units	Results	Analysis Date	Method	Detection Limit
Gross Alpha	pCi/l	1.4 ± 0.9	1-15-21/0801	EPA 900.0	1.4

Alpha Standard: Th-230

Thomas J. Weeks
Laboratory Manager

Test results meet all requirements of the 2016 TNI standards. Statement of estimated uncertainty available upon request. Test results refer only to sample(s) listed.
