Date:	November 4, 2019
To:	Beth Callahan, Project Manager, Maine Department of Environmental Protection
	Karem Gungor, Environmental Engineer, Maine Department of Environmental Protection
From:	Elizabeth M. Ransom, P.G. Ransom Consulting, Inc.
Subject:	Nordic Aquafarms, Inc., Land-based Aquaculture Facility, Belfast, Maine L-28319-26-A-N, Review Comments
Project No.:	171.05027

This memo provides responses to the Technical Review Memorandum from Karem Gungor to Beth Callahan dated October 3, 2019. For clarity, the entire comment from the technical memorandum has been copied below and italicized. Responses are in regular text, and on the attached plans and figures as referenced below.

1. First Diversion Trench (Sheet CElll): This trench will not be connected to the edge drain/culvert bypass system as shown in the ESC phasing plans. The trench will intercept the surface runoff from approximately 8.5 acres of upgradient area (see south of Subcatchment 9 flow path in Sheet CW-102) which appears to shed into the streams S3, SS, and S6 under the existing/pre-development conditions. The intercepted flow (surface runoff+ groundwater) will be discharged into an easterly plunge pool based on the underdrain invert elevations provided in Sheet CElll. I recommend the following:

A revised Section 14 Erosion and Sedimentation Control (ESC) Plan has been included as **Attachment A**. Revised phasing plans are included as **Attachment B** and revised phasing plans with aerial background imagery are included as **Attachment C**. Drawings and narratives described in the responses below can be located in the respective attachments.

a. Connect the trench underdrain to a bypass culvert or bypass culverts so that the intercepted flow is conveyed southerly and contributes to the baseflow provided for the streams S3, S5, and S6 under the post-development condition,

1a. A new extended bypass drain has been added to the plans during Phase 2A of the project. The Phase 1 outlets will be eliminated, and the new drain system will convey flows around the site to discharge at Streams S3, S5, and S6, as requested.

b. Eliminate the westerly and easterly outfalls of the trench underdrain shown in Sheet CE118. The outfalls may be necessary during the initial phases of the project; but they need to be removed or

deactivated post construction to simulate the pre-development site hydrology to the extent practicable and mitigating the project's hydrologic impact on the jurisdictional streams,

1b. Elimination of the Phase 1 outlets is shown during Phase 2A of the project and noted on revised sheet CE117.

c. Provide a flat-bottom basin over the diversion trench in lieu of the easterly sloped swale as shown in the grading plans (Sheets CG105 thru CG107). A basin will improve the interception of the upgradient surface runoff by the trench and its conveyance to the streams. The basin can be equipped with catch basins and similar outlet control structures to prevent overflow,

1c. The former swale has been revised to show a flat bottomed basin at this location, as requested. Revised drawings grading plans CG105 to CG107 have been included in **Attachment D**.

d. Clarify how the top of the trench will be permanently stabilized post construction: will it be exposed as shown in Detail ESC-7 in Sheet CE502? The related grading plans (Sheets CG105 thru CG107) do not show any exposed rock surface associated with the diversion trench,

1d. The top of the trench will be stabilized using a sprayed soil/mulch/ seed mix that will be applied over the temporary stone surface at the end of construction. This will provide a stable, vegetated surface to the trench without requiring removal of the riprap stone, and the associated disturbance.

e. Ensure that the phasing and grading plans are consistent on the trench.

As requested, the plans have been made consistent.

2. Second Diversion Trench (Sheet CE112): Since this trench will be below the finished floor elevation of Building 1, will it have a minimum crushed stone reservoir depth of 6 ft as shown in Detail ESC-7 in Sheet CE502? A separate detail drawing for this trench is requested.

During the initial installation, the second diversion trench will be exactly the same as the first, with a crushed stone reservoir to divert groundwater from the surrounding area into the diversion culvert that outlets in a southerly direction to the project limits. The same detail will apply to both trenches (Detail ESC-7 on Sheet CE502). As the excavation and backfill proceeds, the trench will be buried in the backfill section.

3. Bypass Culvert (Sheet CE502): Are perforated pipes necessary for the bypass culverts?

Yes. These culverts are intended to convey surface water from the channels as they are filled during construction. They will also intercept perched groundwater from surrounding areas, as the stream channels currently do. The perforated pipes will allow the bypass culverts to accept groundwater flow approaching from the sides of the channel and will hence continue to operate in a similar manner to the current natural channels.

4. Please provide the approximate length of underdrain network that will drain into the plunge pools shown in Sheet CG102 and CG104 (CG104: the plunge pool will discharge into S3 stream; CG102: westerly plunge pool will discharge into SS stream and easterly plunge pool will discharge into S6 stream). Assuming the underdrain length as a proxy for the flow, demonstrate that the post-development baseflows of the streams S3, S5, and S6 rank similarly with the pre-development flow ranking of the streams obtained from the pre-development hydrologic model results (Subcatchments S2, S3, and S4).

The length of the underdrain network that will drain the site and feed streams S3, S5 and S6 is approximately 12,500 linear feet. The underdrain network is designed to intercept the same

contributing area of surface and groundwater flow that currently provides the base flow for these channels. Therefore, we anticipate that the post-development baseflow conditions will be similar to the pre-development condition where the channels remain downstream of the project site.

5. *Building Excavation Dewatering: The applicant has provided a detailed response to my earlier comment (Comment #1 in my previous memo) on the building pad dewatering. Assuming an average (horizontal) hydraulic conductivity of 2.2xlQ-6 cm/s, the applicant estimated that the groundwater seepage into a 200' (W) x400' (L) x15' (D) excavation pit to be 0.02 cfs (Note: the phasing plan limits the "uncovered grubbed area at any given time" to 80,000 sf). The field conditions can significantly deviate from this assumption and result in higher seepage due to the presence of highly conductive layers (see the shallow water levels observed in the soil borings B102, B105, B107, and B110 within Building 1 and 2 footprints). Therefore, a dewatering contingency plan is necessary particularly for the overburden removal operation during which there will be no edge drains in place. What if temporary sediment basins are overwhelmed by the dewatering? Will the sediment basin be decanted into an undisturbed, well vegetated temporary buffer area? If so, the temporary buffer areas that will be used for emergency dewatering need to be shown in the phasing plans.*

It is understood that ground and groundwater conditions may vary significantly from the average assumption quoted in the previous comment response (0.02cfs over an uncovered area of 80,000sf). The 12" Type C edge drains provided have been designed to accommodate significantly higher flows than the assumed average de-watering load. A 12" pipe operating under channel flow conditions, with a slope of 0.4% and an "n" value of 0.012 has a capacity of 2.4cfs, or 120 times the calculated dewatering flow during average ground conditions. In our opinion this offers a satisfactory factor of safety. However, the erosion control plan also includes the use of temporary sumps and pumping to sediment basins to accommodate excess flows in the event of failure of the edge drains. Further back-up will be provided by the temporary use of dirt bags in isolated areas, if and when necessary. While we acknowledge that that groundwater conditions on the site will only be fully understood when the excavation work is underway, we feel that this offers a suitably robust approach to managing the risks associated with dewatering operations at the site.

6. Soil Stockpiles: The applicant has stated that major on-site stockpiling of soils is not anticipated. If the trucks haul the overburden off site and bring the granular borrow in round trips (see page 14- 5 in Appendix 14-A), there will be a need for stockpiling approximately 50,000 cy of granular borrow until the building excavation reaches the subgrade elevation which may take more than two months (see the phasing summary table in Appendix 14-A). The earth movement logistics warrant more discussion and clarification: Is it more likely that the overburden and granular borrow hauling will be done in round trips? Or will the trucks haul in the granular borrow after the overburden removal is complete? The second alternative is preferable since it will minimize the need for soil stockpiling on site.

It is apparent from this comment that the methodology for major earthworks at the site was not adequately explained in our previous texts. It is our intention that backfill operations under the building footprint areas will proceed immediately after subgrade elevation is reached in the initial part of the excavation (i.e. backfill with granular borrow will not be held back until the entire building footprint is prepared- the two month period quoted in the comment). The excavation will commence with installation of the edge drain outlets and the sand covered edge drains. Excavation will then proceed from west to east, with backfill following immediately behind excavation to reduce exposure of native soils and achieve the most rapid possible stabilization of the excavated areas. In this way, the trucks used to export the unsuitable soil will be available to return to the site with granular backfill for placement in the excavation. The area of uncovered soil at the site will be limited to 80,000sf at any given time.

a. Due to its texture and erodibility, on-site overburden stockpiling needs to be clearly restricted in the ESC plan by inserting the following statement where applicable:

"The overburden shall not be stored on site more than two weeks".

6a. The requested statement has been added to the revised narrative. This can be found in Section 14.6.

b. Soil stockpiling areas need to be shown in the phasing plans if the earth hauling will be performed in round trips.

6b. As noted above, based on the earthworks methodology we do not anticipate generating large soil stockpiles, therefore they are not shown on the plans.

7. Please amend the ESC plan with the response, including the table, provided for Comment 8.a in my previous memo.

A revised narrative is provided with the table added, as requested. This can be found in the Sediment Basin Sizing Narrative

8. Please provide a detail of the temporary structure which will divert the peripheral surface runoff away from the building pad excavation.

A diversion detail has been added to Sheet CE505 (Detail ESC-23). The revised Sheet CE505 is included as **Attachment E**.

9. Flocculant Use: The applicant's concern in regard to flocculants' effectiveness for construction site turbidity control in Maine is noted. Success of flocculation largely depends on the flocculant selection and proper application. I recommend a trial run to determine the effectiveness of powder and solid block flocculants for turbidity control during Phase 1B of the project (particularly during the major earthwork/overburden removal stage). Flocculant selection must be based on the lab analyses (e.g., jar testing) performed on at least three representative (i.e., native silty) soil samples. A copy of the lab reports must be submitted to the Department for its review and feedback. The selected flocculants need to be applied per the manufacturer's instructions and in consultation with the Department. If the flocculant use does not result in noticeable improvement in the turbidity control, the applicant may elect not to use flocculants in the subsequent phases of the construction. Please amend the ESC plan accordingly.

The ESC plan has been revised to include trials of flocculants for use in the sediment basins, as requested. References to this can be found in Section 14.7 (12) and the Sediment Basin Sizing Narrative.

10. The post-development subcatchments 23, 25, and 31 discharge into "Belfast Reservoir One" as shown in Sheet CW-104. In order to eliminate the phosphorus export from the developed areas of these subcatchments into the reservoir, please:

a. Delineate the grassed areas within Subcatchments 25 and 31 in Sheets LP102, LP103, and LP104 and provide the following note for the delineated areas:

"These grassed areas shall not be mowed than more than twice a year and maintained as meadow. No phosphorus containing fertilizer shall be used in these areas except for establishing grass cover on bare soil.",

The plans have been updated to include the language regarding fertilizer and maintenance. See attached Landscape Plans (**Attachment F**).

b. Revise the stormwater drainageway proposed for Subcatchment 23 and direct the subcatchment's entire runoff into the closed drainage system which ultimately discharges into the coastal wetland from the existing clarifier (PTlO shown in Sheet CW- 104).

The plans have been revised to include a catch basin at the end of a drainage swale to collect runoff and direct to the closed system. See attached plans (**Attachment G**).

11. GSF #lB: The actual surface area of the filter appears to be smaller than 773 sf, which is used in the calculations. Please review.

The grading has been revised to adequately show the revised GSF #1B. The filter surface is calculated to be 802, but 773 was left in the calculations. Refer to the Stormwater Drawings (**Attachment G**).

l2. The surface runoff will mostly sheet flow into the proposed GUSFs. Therefore, the finished grades must be consistent with the treatment areas shown in the figures enclosed with the appendix. Please:

a. Provide more spot elevations and arrows indicating the slope and the flow direction in the grading plans,

b. Please provide the following note in a plan sheet where applicable:

"The contractor shall be instructed by the inspecting engineer to ensure that the as-built drainage areas of the grassed underdrained soil filters will be as shown in the revised figures given in Section 12 Appendix B of the permit application."

See attached plans (**Attachment G**).

13. Figure 2: Subcatchment 1B includes areas westerly from GSF 1B which will not be treated by the filter. Please revise the figure. Also, CB-16 rim elevation needs to be 66.90 ft.

Figure 2 has been revised. See attached (**Attachment G**).

14. Figure 4: CB-17 and CB-18 rim elevation needs to be corrected: both elevations need to be 62.0 ft.

The table for Figure 4 has been revised. See attached (**Attachment G**).

15. Figure 6: Will the purple area be treated by GSF15? If so, the treatment area is approximately 9,000 sf. Based on the calculations provided in Appendix A, the filter basin may not have adequate water quality volume for the proposed treatment area. Please review the design and revise it if necessary. Also, Building #7 north of GSFlS will not have a green roof; however, the treatment tables indicate that it will have green roof? SSF43 was mistakenly labeled as SSF13. Please revise.

The area in purple included a portion of a canopy for Building 7. This canopy will have a green roof, but the roof of the building will not be green. Therefore, this is a partial green roof and the calculations are intended to reflect that. The canopy is represented by a different color to reduce confusion. See attached Figure 6 (**Attachment G**).

16. Sheet CG1O1: The 12" storm drain daylighting into GSF24 at the invert elevation of 39.24 ft (P85 in Appendix B) is not clearly shown in this grading plan.

The pipe run has been revised and the invert is 41.5.

17. Sheet CO-501 & CO-502: Please provide information on the subgrade of each grassed underdrained soil filter, subsurface sand filter, and pervious pavers: will it be granular borrow or native soil? Specifically, placing the subsurface sand filters over the granular borrow may help with infiltrating the treated roof runoff which may help with mitigating the hydrologic impact of the project on the jurisdictional streams.

The details have been revised. Refer to Detail drawings (**Attachment G**)

Subsurface Sand Filters: Comment #18 thru #20.

There is no separate bypass manifold which will convey the inflow into the StormTech SC740 chambers when the isolator row capacity is exceeded, or when the isolator row is clogged with sediment. Since the subsurface sand filters will exclusively treat the roof runoff that will contain significantly less sediment load as compared to other impervious surfaces like driveways or parking areas, the design is acceptable.

No action required

18. Larger scale plan view drawings of the proposed subsurface sand filter systems need to be provided. Isolator rows, distribution manifolds, inlet, outlet control structures and maintenance manholes need to be shown instead of the typical "Pretreatment Row - Plan View" presented in Sheet CQ-502. Also, please have the pretreatment row designs reviewed by the StormTech representatives and provide their approval letter per Condition #9 stated in the Department's approval letter dated 7/29/16:

https://www.maine.gov/dep/land/stormwater/stormwaterbmps/manufactured-svstems/stormtech%20isolator%20row%20august%202016.pdf

Larger scale drawings have been provided. See attached details. The pretreatment row will be reviewed by either the StormTech representatives or the Cultech representatives (as they make an equal product). The letter will be provided to the Department.

19. SSF 36: Please check the "underdrain elevation (F)" and "underdrain from SSF pipe elevation" in "SSF Outlet Manhole" and make sure the underdrain system has positive drainage.

Detail sheets have been revised. See attached plans (**Attachment G**).

20. SSF 36 and SSF 40: Please reduce the inlet control structure weir elevations such that they are equal to "Elevation C + 3 ft" which is the top elevation of the Storm Tech SC740 chambers/isolator rows.

See attached plans (**Attachment G**).

Manmade Pervious Pavers: Comment #21 thru #25.

21. Please revise "Manmade Pervious Pavers-Plan View" detail given in CQ-501 so that run-on flow paths and width of pervious pavers for each of the proposed manmade pervious paver (MPP) strip are clearly presented. A table including the paver width, run-on length of each MPP needs to be presented with the detail drawing.

See attached plans (**Attachment G**).

22. MPP14: The grading proposed in Sheet CG103 does not appear to be consistent with the treatment area shown for MPP14 in Appendix B Figure 5. There appears to be an island between the easterly

impervious pavement and the pervious paver strip; the island will not let the surface runoff shed into the pervious paver strip. The grading needs to be revised and spot elevations need to be provided.

See attached plans (**Attachment G**).

23. MPP19: Spot elevations and slope directions need to be shown in Sheet CG104 to ensure that the pervious strip can treat entire Subcatchment 19 shown in Appendix B Figure 5.

See attached grading plans (**Attachment D**).

24. MPP22: The surface area measured in Sheet CG102 is approximately 2,800 sf, which is less than the surface area used in Appendix A Sheet #20 (i.e., 3,240 sf).

The area is smaller and the calculations have been revised (**Attachment G**).

25. MPP30: HydroCAD pond (Pond mpp30) (Page 414 & 415 of the revised post-development HydroCAD model outputs) has an R-Tank configuration different from the other manmade pervious paver ponds since the applicant aimed to provide additional storage volume for the 25- yr storm peak flow attenuation. Please provide the plan and profile view drawings of the proposed R-Tank system.

See revised details (**Attachment G**).

Vegetated Roofs: Comments #26 Thru #30.

26. Sheet CO-503: The applicant proposes to use pregrown modular vegetated roof systems (i.e., Firestone Skyscape Vegetative Roof Systems). The "Vegetated Roof Cross-section" detail needs to be revised to reflect the proposed modular system. Also, my understanding is that the applicant proposes to use two different types of modules (Semi-intensive & Intensive; see Appendix A page #38 & page #34) for the proposed vegetated roofs. Types, specifications, and total number of the modules to be used for each individual vegetated roof needs to be presented in a tabular format in this plan sheet.

Please see revised plan sheet (**Attachment G**).

27. Please review the water storage volume figure used in the sizing calculations. As far as I understand, the "estimated module water storage volume" is reported as 0.20 cf/sf for the semi- intensive module and 0.26 cf/sf for the intensive module in the manufacturer's document presented as Sheet 38 in Appendix A. Both semi-intensive and intensive modules have a surface area of 2.08 sf. Therefore, total estimated water storage volume of a semi-intensive module becomes 2.08 sf x 0.20 cf/sf= 0.416 cf and the same figure for an intensive module becomes 2.08 sf x 0.26 cf/sf= 0.541 cf. Please review the sizing calculations and revise the design if necessary.

Please see the revised sizing calculations and design (**Attachment G**).

28. Subcatchment 15 (GSF15 & GR15): The treatment area breakdown needs to be clarified. Is GR15 proposed as a self-treating surface which receives no runoff from other developed areas? Also, will GSF15 treat 3,184 sf of grass/landscaped area or 4,184 sf of grass/landscaped area? Please revise Figures 6 & 7 in Appendix B by clearly delineating the green roof area. Similar clarifications (e.g., callouts, marking) are necessary in Sheet CG107.

Building 7 has a canopy that will use a vegetated roof. It appears on the figures as the same color as Subcatchment 15. This has been revised on Figure 6 as well as CQ107.

29. Subcatchment 28 {GR28): "Table 1: Stormwater Treatment" states that GR28 will treat 1,407 and 2,429 sf of impervious and landscaped area, respectively. It is unclear which building within Subcatchment 28 will have a vegetated roof. Will the existing building redeveloped into a visitor center (Building 10 shown in Sheet CPlOl) which will have GR28? The extent of redevelopment and new development proposed for Subcatchment 28 needs to be clearly stated in the stormwater management plan and appropriate callouts need to be given in the layout and grading plans (Sheets CP101 and CG101).

The vegetated roof is not for a building, but rather a structural canopy that is proposed over an educational fishpond.

30. Subcatchment 33 (GR33): The "Vegetated Roof' table presented in Appendix A (page #34) shows that the "semi-intensive" modules with water storage volume of 0.2 cf/sf will be used for GR33 whereas GR33 sizing calculations presented in Sheet #31 & #33 indicate that the "intensive" modules with water storage volume of 0.26 cf/sf will be used in GR33. Please review Appendix A and make necessary revisions.

The "semi-intensive" modules with water storage volume of 0.2 cf/sf will be used for GR33. Please see the revised sizing calculations (**Attachment G**).

C. Flooding Standard: Comments #31 Thru #34.

31. This comment is related to Comment #1 provided in this memo:

Based on my analysis of the existing elevation contours and drainageways, the area south of the flow path shown within the pre-development Subcatchment 9 appears to drain into the pre- development Subcatchments 2, 3, and 4 (Sheet CW-102). Subcatchments 2, 3, 4, and 9 of the pre- development model need to be revised to reflect this drainage pattern. The post-development model will also need to be revised per Comment #1: the upgradient surface runoff captured by the northerly interceptor needs to be routed to the southerly analysis point of PT5. The flow due to the groundwater intercepted by the underdrain system can be disregarded in the post- development model.

The Pre- and Post- development analysis has been updated to include the recommended routing. See **Attachment G.**

32. Please provide the technical references justifying the curve number value (i.e., 61) selected for the vegetated roofs.

A curve number of 74 was used for routing vegetated roofs as it best fit with >75% grass cover over a HSG C soil.

33. Subsurface Sand Filter Ponds: The post-development model results show that the "secondary outflow" device (i.e., the weirs) in the inlet control structure (ICS) ponds are triggered by the relatively small one-inch storm which results in significant amount of flow bypassing the subsurface sand filter pond. Please review and revise the ICS and subsurface sand filter ponds in the post-development model.

These are designed to treat only the water quality volume (1-inch storm). Larger storms pass over the weir.

34. "Table 6 - Pipe Capacity":

a. What is the rationale behind providing the "energy grade line (EGL)" in the table? The EGL is the sum of velocity head, pressure head, and elevation head. Since the stormwater drains will have open channel flow, it would be more appropriate to use the hydraulic grade line (HGL), which is essentially equal to the elevation head for open channel flow, for the storm drain capacity analysis,

The slope of the EGL was compared to the slope of the pipe to evaluate whether the pipe was passing Q at higher than full flow capacity.

b. 10-yr 24-h peak flows in multiple pipes exceed their full-flow capacity. Please explain why the diameters of these pipes were not increased to increase the full-flow capacity,

While pipes can convey more than full flow capacity, we have increased pipe diameters as requested.

c. "10-yr EGL" values exceed the flood elevations of CB-16, DMH-59, and DMH-23 which indicate potential flooding around these structures for the 10-yr storm. Please address.

The pipe sizes have been upgraded.

CROSS-SECTION VIEW
U.S. PATENT NO. 8,501,016

SPECIFICATIONS:

1. STEEL REINFORCED, COLD JOINT SECURED MONOLITHIC CONCRETE STRUCTURE (1,030 LBS).
2. CONCRETE SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 4,000 PSI AT 28 DAYS. CONCRETE AIR ENTRAINED (4 PERCENT TO 8 PERCENT BY VOLUME).
3. MANUFACTURED AND DESIGNED TO ASTM C858.
4. THREE-POINT PICK USING RECESSED LIFTING POCKETS WITH A STANDARD HOOK.
5. SOIL UNDER BASE TO BE COMPACTED TO 95 PERCENT STANDARD PROCTOR.
6. TWO-PIECE LIGHT-DUTY GALVANIZED GRATE (34.5 LBS/PIECE) FOR 541 LB CONCENTRATED LOAD OR 309 LB/SQFT UNIFORM LOAD.
7. TWO-PIECE HEAVY-DUTY GALVANIZED GRATE (77.5 LBS/PIECE) FOR 2,456 LB CONCENTRATED LOAD OR 1,404 LB/SQFT UNIFORM LOAD.
8. USE EXPANSION JOINT MATERIAL BETWEEN TURRET AND BIORETENTION INLET.

RAIN GUARDIAN - TURRET - TYPICAL DETAIL

SCALE: N.T.S. SOURCE: MDEP LAST UPDATED: 05/2016

1. THE APPLICANT SHALL RETAIN THE SERVICES OF A PROFESSIONAL ENGINEER TO INSPECT THE CONSTRUCTION AND STABILIZATION OF THE STRUCTURAL STORMWATER TREATMENT MEASURES TO BE BUILT AS PART OF THE PROJECT. IF NECESSARY, THE INSPECTING ENGINEER WILL INTERPET THE CONSTRUCTION PLANS FOR THE CONTRACTOR.

2. ONCE ALL STORMWATER TREATMENT STRUCTURES ARE CONSTRUCTED AND STABILIZED, THE INSPECTING ENGINEER WILL NOTIFY THE DEPARTMENT IN WRITING WITHIN 30-DAYS TO STATE THE STRUCTURES HAVE BEEN COMPLETED.

3. ACCOMPANYING THE ENGINEER'S NOTIFICATION MUST BE A COPY OF THE TEST RESULTS FOR ANY SOIL FILL, AGGREGATE, ROCKS AND THE SPCIFICATIONS OF ANY GEOSYNTHETICS USED IN THE CONSTRUCTION OF THE STRUCTURAL TREATMENT MEASURES AND A LOG OF THE ENGINEER'S INSPECTIONS GIVING THE DATE OF EACH INPSECTION, THE TIME OF THE INSPECTION, AND THE ITEMS INSPECTED ON EACH VISIT.

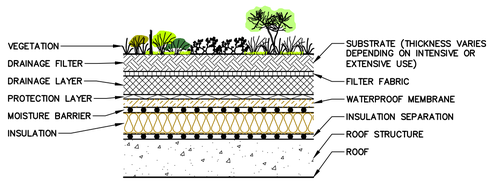
SCALE: N.T.S. SOURCE: MDEP LAST UPDATED: 05/2016



GROWING MEDIUM: THE VEGETATION SUPPORT COURSE SHOULD ACCOMMODATE A DENSE ROOT STOCK AND HAVE ALL THE PHYSICAL, CHEMICAL, AND BIOLOGICAL PROPERTIES NEEDED FOR PLANT GROWTH. AVAILABLE MATERIALS INCLUDE:

- SOIL MIXTURES – IMPROVED TOP AND UNDERLYING SOIL.
- AGGREGATE MIXTURES – MINERAL AGGREGATE MIXTURES WITH HIGH OR LOW ORGANIC CONTENT OR WITH AN OPEN-PORE GRANULAR STRUCTURE WITH NO ORGANIC CONTENT.
- SUBSTRATE BOARDS – BOARDS MADE FROM MODIFIED FOAM MATERIALS OR MINERAL FIBERS.
- VEGETATION MATTING – MATTING WITH MINERAL/ORGANIC AGGREGATE MIXTURES. THE ORGANIC CONTENT OF THE VEGETATION SUPPORT COURSE SHOULD BE AS SHOWN ON TABLE 7.6.1.

Appendix E: Post Development Calculations

Site Description:

The site (refer to Site Location Map) is an approximately 54-acre development parcel consisting of several parcels under contract with multiple entities including the Belfast Water District (BWD), Mathews Brothers, and Sam Cassida (Refer to the attached Site Location Map). The portion of the site on the Mathews Brothers parcel in the northeast quadrant of the site is primarily grass, with a stand of trees along the drainage channel that defines the eastern boundary of the new parcel. The remainder of the development parcel (from Belfast Water District and Cassida parcels) is primarily vegetated (wooded) with an area in the south currently developed with structures and pavement associated with operations of the BWD. The Belfast Reservoir Number One exists south of the site with a 250-foot strip between the reservoir and the site being retained by the Belfast Water District, within the Resource Protection District, as a buffer to the reservoir.

Portions of the site within the land owned by the Belfast Water District are currently developed with buildings (office building, former filter house, maintenance garages) and associated driveways and parking associated with current BWD operations. A concrete dam controls the water level to the reservoir and piping associated with the former use of the reservoir as the water supply for the City of Belfast still exists adjacent to the dam and office building. Also adjacent to the office building and the dam is a former settling basin previously used in treatment of domestic water supply.

The topography of the undeveloped site slopes generally from north to south/southwest into Reservoir Number One. Groundwater in the area also appears to flow from north to south across the site toward the reservoir. The site slopes steepen within the 250-foot buffer with fingers of notable rivulets, drainage channels, and ravines exiting into the reservoir. The reservoir is controlled by a dam located just west of Route 1 and outlets into Belfast Bay. There is considerable area upgradient of the site which also drains to the reservoir. This Stormwater Management Plan also addresses the offsite areas currently draining onto and through the site.

A Class B high intensity soil survey (HISS) has been performed on this site and is included in *Section 11, Soils* of this Site Location of Development Act permit application. The results of the HISS mapping are included in the stormwater analysis.

Wetland areas and streams are identified on the existing conditions plans included as an attachment in this Section. In addition, these features are shown on the stormwater plans (also included as an attachment) as well as the HISS mapping discussed in the above paragraph.

Development Description:

Nordic Aquafarms proposes the development of a salmon fish growing operation capable of providing 33,000 metric tons per year of seafood to consumers in the northeastern US. While construction is proposed in two phases (see previous sections of this application for additional information on construction phasing), the stormwater management systems have been considered for the complete project build-out.

The salmon growing operation is done indoors and therefore requires a fair number of buildings to perform that function. Buildings proposed on-site consist of:

Building 1 – Consists of 3 grow modules constructed in succession.

Building 2 – Consists of 3 grow modules constructed in succession.

Building 3 – Smolt Building

Building 4 – Fish Processing Facility

Building 5 – Central Utility Plan

Building 6 – Oxygen generation. This area is currently designated as a building but may be modified based on the requirements of the oxygen generation contractor and their equipment. This may be an outdoor facility that houses generation equipment on a concrete pad. If this is the case, the concrete pad will be surrounded by curbing to collect stormwater runoff.

Building 7 – Office/Maintenance Building

Building 8 – Water/Wastewater Treatment Building

Building 9 – Gate House

The buildings are arranged such that operations central to the needs of the fish growing process will be performed in the middle of the complex, while the larger fish grow module buildings are on the exterior. Water and wastewater treatment will be closer to Route 1 to facilitate intake and discharge of seawater. The building complex will be supported by paved access drives surrounding the facility and between buildings. Efforts were made to group buildings adjacent to one another to minimize the amount of

pavement. Loading areas are located adjacent to access drives. Employee parking is scattered throughout the complex in areas that expect to see more employee activity such as the Smolt Building, the processing

facility, the office/maintenance garage, and the water/wastewater treatment facility. Additionally, a small parking area is provided adjacent to the entrance gate to facilitate public use of the existing trail system located on the property within the 250-foot resource protection district being retained by the BWD. Among and adjacent to the paved areas are landscaped islands and grassed areas.

Grading of the site post development still slopes from the north to the south/southwest. To accommodate the function of the buildings and associated access, the center of the site has less significant grade change while the northern and southern portions of the site include steeper slopes to match grading at the 40-foot "no disturbance" buffer at the site boundary.

While existing drainage channels in the center of the site will be filled to accommodate development, the channels to the south and through the 250-foot buffer retained by the BWD will remain. In addition, stormwater from off-site areas to the north will be diverted and underdrain piping will be included around building foundations and during construction to facilitate transport of any groundwater encountered toward the existing drainage channels to the south.

Stormwater Management – Basic Standards:

Erosion and sedimentation control measures during construction are detailed within *Section 14, Basic Standards Submissions* of this Site Location of Development Act Permit. Post-Construction stormwater management practices and good housekeeping practices will be in accordance with Maine DEP Best Management Practices. A post construction stormwater management plan as well as inspection and maintenance requirements and third-party inspection contract are provided in *Appendix C* of this Stormwater Management Plan.

Stormwater Management – Quality (General Standards):

A project must meet Maine's *Chapter 500, Stormwater Management* general standards if the project results in one or more acres of impervious area, or 5 acres or more of developed area for projects that are not within the direct watershed of an urban impaired stream or a lake most at risk (as defined by Chapter 502). To meet the general standards, the project's stormwater management system must include treatment measures that will provide pollutant removal or treatment (or both), mitigate for the increased frequency and duration of channel erosive flows due to runoff from smaller storms, and mitigate potential temperature impacts. To do that a project must provide treatment of 95% of the impervious area and no less than 80% of the developed area. In addition, runoff from upgradient areas must either be redirected away from the project's stormwater treatment measures or that measure must be sized to address the runoff volume of the upgradient area at 50% of the sizing requirements. Although the amount of on-site treatment provided may be reduced by providing treatment on a currently untreated off-site area in the same watershed, this is not proposed for this project at this time.

Treatment of stormwater is addressed using Maine's Best Management Practices (BMPs). These BMPs are focused on meeting the following water quality objectives:

- Effective pollutant removal – removal of fine particles that carry nutrient and heavy metal load as well as dissolved pollutants and hydrocarbons.

- Cooling – to protect aquatic life within a river, stream, or brook watershed discharge must effectively cool down.

- Channel protection – discharge within a river, stream, or brook watershed must be released slowly to avoid destabilization and resulting sedimentation of receiving channels.

- Flood control – detention for large, infrequent storm events to avoid flooding infrastructure.

The water quality volume is the initial depth of runoff that is considered to carry the bulk of pollutants deposited since the last rain event. Studies have indicated that the first inch of runoff distributed over the watershed carries 90% of the pollutant load from a storm event. Maine's BMPs identified in Volume III of the Maine Stormwater Management Design Manual consider this when establishing the treatment volume identified within each BMP. The BMPs chosen for this site to meet the water quality objectives include:

- Subsurface Sand Filters: Filtration BMP discussed in *Maine's Stormwater Management Manual, Volume III, Chapter 7.3, Subsurface Sand Filters.*

- Grassed Underdrained Soil Filters: Filtration BMP discussed in *Maine's Stormwater Management Manual, Volume III, Chapter 7.1, Grassed Underdrained Soil Filters.*

- Manmade Pervious Paver Systems: Filtration BMP discussed in *Maine's Stormwater Management Manual, Volume III, Chapter 7.7, Manmade Pervious Surfaces.*

- Green Roof System: Filtration BMP discussed in *Maine's Stormwater Management Manual, Volume III, Chapter 7.6, Vegetated Roofs.*

Project Specific Water Quality Treatment Measures:

The stormwater management facilities identified above are used throughout the developed site. Calculations detailing the sizing of the treatment facilities are in *Appendix A.* The subcatchment areas being treated by each of the stormwater management facilities are identified on 11 x 17 figures at a scale of 1" = 50' within *Appendix B*. The areas are also included on the Post-Development watershed map, which is included as two 24"x36" drawings at a scale of 1" = 120' within *Appendix E*. Table 1 (at the end of this section) indicates the amount of treatment provided within each subcatchment area as well as for the whole site. The results of calculations indicate that greater than 95% of the new impervious surface and greater than 80% of the new developed area are treated by the stormwater management facilities proposed for this development. In addition, each of the stormwater BMPs are further described below with discussions about how they were used on this site.

- Diversion of Upgradient Runoff. A stormwater channel has been provided within the developed area of the site and downgradient of the 40-foot buffer adjacent to the northern property boundary to divert stormwater from off-site areas. Currently, stormwater from upgradient areas travels

south/southwest through the site and toward the stream that defines the eastern boundary of the site (Stream 9). Although the channel is currently not anticipated to provide treatment to runoff from the offsite areas, the channel is designed with a minimal slope of 0.5% to reduce velocity and erosion potential. Stone check dams are also provided to minimize release of sediment to the stream. Post-development hydraulic modelling is provided in *Appendix D*.

- Subsurface Sand Filters (SSF): Subsurface sand filters are being used exclusively to treat runoff from some of the flat building roofs. The chamber system and stone over the sand filter is designed to store stormwater and discharge it at an attenuated rate to reduce thermal impacts downstream of the system. The subsurface system with detention/retention uses sand and does not provide a source of organic matter for filtration. A pretreatment structure in the form of a fabric wrapped chamber provides the initial settlement and filtration of contaminants, although the intent is to minimize the sediment load (and subsequent maintenance) by using only stormwater runoff from roofs. The roofs of these buildings are an unlikely source of hydrocarbons and therefore hydrocarbon pretreatment is not considered.

  Buildings 1 and 2 are to be built with 3 grow modules each – constructed in succession. Each grow module has an individual subsurface sand filter that can be installed at the time of the construction of the module to treat the runoff from the roof. Building 5 (the Central Utility Plant) uses a SSF as does the roof runoff from Building 6 (or the enclosed concrete equipment pad) for a total of eight SSF systems provided. The SSF systems are located primarily beneath paved surfaces. Each is preceded by an inlet control structure which limits the volume of roof runoff discharged to the filter. A weir in the inlet control structure is provided to allow only the equivalent of the treatment volume (as defined by design guidance per Maine Stormwater Technical Design Manual) through a pipe to the chamber system. Storms with volumes in excess of the treatment volume of 1.0 inches times the subcatchment's impervious area is discharged over the weir to the closed piping network. The treatment volume is filtered through an 18-inch sand filter at a rate no less than 24 and no more than 48 hours and the sand filter is underlain with a drainage layer that collects and transports the treated stormwater to the discharge pipe network. six-inch slotted underdrain pipes are provided in the drainage layer beneath each chamber. A solid discharge collector pipe connects the underdrain pipe every 50 feet along the chamber length and discharges to the pipe network.

- Grassed Soil Filters (GSF): Grassed underdrained soil filters are used primarily for treatment of some paved areas as well as landscaped developed areas. The GSF systems capture and retain runoff and pass it through a soil filter media. The media is a mixture of silty sand and organic matter to remove a range of pollutants including suspended solids, phosphorus, nitrogen, metals, hydrocarbons, and other dissolved pollutants. The filter also provides for attenuation of discharge which provides reduction of thermal impacts to downstream areas as well as minimizing potential channel erosion. The system is sized to store the treatment volume (1.0 inches times the impervious area and 0.4 inches times the landscaped developed area) above the filter with the larger volume storms bypassing the filter through a catch basin and into the closed piping system. The 18-inch thick filter media is underlain with a drainage system and perforated underdrain collection piping which ultimately discharges to the catch basin.

  GSF systems are provided in grassed areas adjacent to pavement throughout the site. The size of the system varies depending on the area draining to it but does not exceed 3,000 sf surface area over the soil filter. Locations where the stormwater is transported to the GSF via a channel or a

pipe, a sediment forebay is provided to minimize discharge of sediment to the filter basin. Refer to calculations in *Appendix A*, and stormwater management facility drawings provided in *Appendix B.*

- Manmade Pervious Pavers (MPP): Pervious paver systems are used almost exclusively for the treatment of paved areas on site, though some systems in parking areas may see some runoff from adjacent landscaped area discharging to the system. The MPP system consists of a permeable surface, base, and subbase materials which allow the penetration of runoff into the underlying soil filter. The area of pervious pavers must be no less than 20% of the area being treated and the flow path to the pervious paver section must be no greater than 50 feet. A storage reservoir is provided below the paver bedding material and above the sand filter layer capable of storing the treatment area equivalent to 1.0 inches times the impervious area and 0.4 inches times the landscaped developed area. The 18-inch thick sand filter layer is underlain with a drainage system consisting of R-Tank storage tanks prior to discharge to the closed piping network. Catch basins in the pervious area capture overflow from larger storms and discharge to the R-Tank system. The use of the R-Tank system allows additional storage for attenuation of larger storm events.

  The pervious pavers proposed are H25 loaded so can be used in higher traffic areas, however the paver systems are proposed for parking areas in the center of the site as well as on the outer access drives adjacent to both Building 1 and Building 2. The interior pavers in the parking areas are the full length of the parking spaces and pick up runoff from local paved surfaces. The pavers in the access drives are 6 feet wide and are intended to pick up the runoff from the paved access drive itself.

- Grassed Roof Systems (GRS): The vegetated roofs are limited to those roofs which are technically flat and with limited protrusions or equipment and with minimal anticipated foot traffic. Rooftop vegetation provides advantages beyond stormwater treatment including the reduction in the heat island effect with improvements in building insulation and increases in the life expectancy of the base roof material. The vegetated roof also provides attenuation of stormwater runoff and peak flows as well as treatment under the General Standards of Chapter 500 within a layer of filter media and vegetation. There are two types of vegetated roof systems: extensive and intensive. The extensive roof systems typically provide coverage over the entire roof with a thinner media depth for the growth of sedums or similar arid plants and also provide little treatment. Intensive systems tend to provide access to the roof itself, provide for more open space on the roof and, with a thicker media, provide more nutrient uptake and greater flow attenuation. The containment of the treatment volume within the media provides stormwater treatment and enhances the overall effectiveness of the vegetated roof.

  Buildings on this site will utilize intensive green roof systems. Buildings 3, 4, and 8 will be constructed with green roofs although Building 3 will be constructed in two phases each with a mechanical penthouse extending through the roof system. The design of each green roof system considers up to 20 % of the entire roof area is taken up with the penthouse and/or elevated access pathways to access areas on the roof. The remaining area will utilize an intensive modular pre-grown roof system as manufactured by Firestone. The Firestone Skyscape module platforms are 15” x 20” and, with the number of modules that can fit on the roof, can provide storage and subsequent treatment for a volume equivalent to 1.0 inches x the impervious surface of the entire roof. Although the roof is vegetated, the area is still considered to be impervious. Roof drains

will be provided to collect runoff from the larger storm events and any stormwater that is not able to be stored in the filter media prior to evapotranspiration.

Stormwater Management – Quantity (Flooding Standards):

A project must meet Maine's *Chapter 500, Stormwater Management* flooding standards if the project results in three or more acres of impervious area, or 20 acres or more of developed area. To meet the flooding standard, the project's stormwater management systems must:

- detain, retain, or result in the infiltration of stormwater from 24-hour storms of the 2-year, 10-year, and 25-year frequencies such that peak flow of stormwater from the project site do not exceed the peak flows of stormwater prior to undertaking the project;

- design the piped or open channel systems based on a 10-year, 24-hour storm without overloading or flooding beyond channel limits;

- not flood the primary access road to the project and any public roads bordering the project a s a result of a 25-year, 24-hour storm event

A project is eligible for a waiver from the flooding standard for insignificant increases in peak flow rates from a project site. A waiver is also available for a project in the watershed of a coastal wetland, great pond, or major river segment provided the stormwater is conveyed via sheet flow, in a manmade open channel, or in a piped system directly into one of these resources.

As part of this application, Nordic Aquafarms is requesting a waiver from the flooding standard for the portion of the project which is currently in the watershed of a great pond and a coastal wetland and which is discharging directly to the coastal wetland, below the dam of the reservoir (great pond) through the existing on-site settling tank.

Nordic Aquafarms is not requesting a waiver from the flooding standard for the portion of the project which is currently in the watershed of a coastal wetland but is upstream from an existing culvert on US Route 1. The discharge from this culvert is routed through a downstream property on the opposite side of US Route 1 to the coastal wetland. The project does not intend to upgrade the existing culvert or increase the flow to the channel on the downstream property. It is anticipated that the runoff peak flow to the existing culvert after development will be below peak runoff pre- development for the 2-year, 10-year, and 25-year storm events as well as the 100-year frequency storm. Increase in peak runoff at PT6 (refer to tables below) is primarily due to additional area added to the off-site subcatchment OS 9. The stormwater channel located north of Building 1 to divert off-site runoff is included with OS 9 in the post-development condition.

Stormwater runoff in the pre-development condition is evaluated at multiple analysis points. Runoff from off-site subcatchments of 9, 10, and 11 is evaluated at a point where it enters the stream along the eastern boundary (PT6). Runoff is also evaluated at locations of culverts discharging under US Route 1 (PT7, PT8, and PT9). Runoff toward the Little River is evaluated at PT1. There are three separate analysis points (PT2, PT3, and PT4) which are combined as PT5 for runoff headed toward Reservoir Number One. Runoff from subcatchment 28, which consists of existing roadway and buildings, is evaluated at a point just below the dam (PT10). Pre-development stormwater plans, HydroCAD calculations, and backup

calculations are included in *Appendix D*. Subcatchments in the post-development condition were established based on subareas used to define treatment boundaries. The majority of the subcatchments discharge to the closed piping system which ultimately discharges through the existing settling basin below the dam at Reservoir Number One. In addition, there are analysis points that mimic the same locations evaluated in the pre-development condition; PT1, PT5, PT6, PT7, PT8, PT9 and PT10. Post-development stormwater plans, HydroCAD calculations, and backup calculations are included in *Appendix E*.

Hydraulic Analysis:

Stormwater runoff calculations for quantity were made using the HydroCAD 10.0 computer program, which is based on the Soil Conservation Service's TR-20 methodology. Runoff hydrographs are generated based on a standard Type III 24-hour storm for Waldo County identified in Appendix H of *Maine DEP Chapter 500, Stormwater Management.*

Four storm events were evaluated as follows:

1. 2-year frequency flood event: 2.9" rainfall
2. 10-year frequency flood event: 4.2" rainfall
3. 25-year frequency flood event: 5.2" rainfall
4. 100-year frequency flood event: 7.2" rainfall

Runoff Curve numbers were determined based on land coverage and hydro-geological soil type C. Times of concentration were developed based on runoff flow paths for each subarea and shown on the Pre and Post-Development plans. A minimum Tc of 6 minutes was set in the HydroCAD model.

Peak runoff flow rates and runoff volumes are provided at the analysis points, which are identified on the Pre and Post-Development plans. Comparison of the runoff peak flow rates are provided at each analysis point on Tables 2-5 below

Table 2 – 2-year Storm

Analysis Point	Pre-Development	Post-Development
1	1.9 cfs	0.9 cfs
5	11.4 cfs	9.5 cfs
6	11.1 cfs	11.2 cfs
7	0.6 cfs	0.6 cfs
8	0.1 cfs	0.1 cfs
9	14.1 cfs	13.8 cfs
10	3.1 sfs	3.2 cfs

Table 3 – 10-year Storm

Analysis Point	Pre-Development	Post-Development
1	4.8 cfs	2.0 cfs
5	15.0 cfs	3.7 cfs
6	28.0 cfs	29.5 cfs
7	1.4 cfs	1.4 cfs
8	0.3 cfs	0.3 cfs
9	42.0 cfs	40.1 cfs
10	5.8 cfs	5.6 cfs

Table 4 – 25-year Storm

Analysis Point	Pre-Development	Post-Development
1	7.3 cfs	3.5 cfs
5	39.0 cfs	30.0 cfs
6	35.2 cfs	35.5 cfs
7	2.1 cfs	2.1 cfs
8	0.5 cfs	0.5 cfs
9	46.7 cfs	45.2 cfs
10	7.9 cfs	7.5 cfs

Table 5 – 100-year Storm

Analysis Point	Pre-Development	Post-Development
1	12.9 cfs	5.8 cfs
5	66.9 cfs	44.0 cfs
6	40.8 cfs	42.8 cfs
7	3.7 cfs	3.7 cfs
8	0.8 cfs	0.8 cfs
9	79.5 cfs	76.9 cfs
10	12.2 cfs	11.3 cfs

Storm Sewer Piping Capacity:

Stormwater piping was sized to have capacity to handle the 10-year storm event at a minimum. HydroCAD was used to determine the water levels in the upstream and downstream structures, the maximum flow rate in the pipe, and the calculated velocity at the peak of the storm event. The Energy Grade Line (EGL) elevations were calculated from the water levels generated within the software. The pipe was sized to keep the velocity in the pipe between 2.5 feet per second (fps) and 10 fps with a preferred velocity closer to 6 fps. Although the 10-year storm is the basis for design, the 25-year event was also evaluated, and every effort was made to provide increased capacity if possible. The flow rate in the pipe (generated by HydroCAD) was compared to the full-flow capacity of the pipe (using Mannings equation). The slope of the EGL was also compared to the slope of the pipe invert. Piping runs with significant discrepancies were re-evaluated to consider resizing the pipe as necessary. The EGL

elevations were compared to the flood elevations (most often the rim of structures) to determine if there was too much pressure building in the lines. Refer to Table 6 – Pipe Capacity attached.
