**Mr. Michael Carey**  
**SWEB Development USA LLC**  
209 West Central Street, Suite 306  
Natick, MA, USA, 01760

Dear Mr. Carey,

**Re: Shadow Flicker Assessment  
Silver Maple Wind Project**

---

### **Introduction**

Strum Consulting (Strum) was retained by SWEB Development USA LLC (SWEB) to conduct a shadow flicker assessment for the proposed Silver Maple Wind Project (the Project) located near the town of Clifton, Maine, USA. SWEB is proposing the development of a 20 megawatt (MW) wind power project that would consist of five wind turbines, and would be located adjacent the existing 9 MW Pisgah Mountain wind energy project that is also owned by SWEB.

SWEB is considering two turbine models which are largely the same, with the exception of the hub height [100m (328 feet) and 117m (384 feet)]. Both turbine models will be evaluated in this assessment.

Pursuant to Maine Law 38 M.R.S. § 484(10), wind energy developments must be sited to avoid unreasonable shadow flicker effects. The Town of Clifton's Land Use Ordinance has also set criteria for evaluating and assessing shadow flicker impacts which must also be taken into consideration.

The purpose of this assessment is to conduct a shadow flicker assessment consistent with the requirements of the State of Maine and the Town Clifton to support SWEB's applications for the development of the Project. In addition to these assessments, we will provide guidelines for the mitigation of the shadow flicker exposure as necessary.

### **Methodology**

Shadow flicker is caused by alternating changes in light intensity caused by rotating wind turbine blades casting shadows on the ground, an object, or a building. Shadow flicker occurs as the shadows of the blades move past the observation point, when the rotor is directly between the observer and the sun, and the rotor is spinning.

The WEA sets a limit of 30 hours per year of shadow flicker exposure (shadow hours) at an occupied building. Additionally, the LUO sets a limit of 10 shadow hours per year at a non-participating residential parcel and a roadway, and 0 shadow hours at a roadway intersection. For the purpose of this analysis, shadow hours at each shadow receptor (defined below) were estimated using the Shadow (Flicker) Module of Windpro v3.2 Software, which takes into account the turbine information (hub height, blade sweep, location, etc.), topography, and the location and elevation of each receptor location. A bare terrain model was used to generate conservative estimations of the shadow flicker exposure estimations in the absence of vegetation, although it is highly likely that vegetation (tree cover) would reduce the actual shadow flicker exposure at receptors. Additionally, “greenhouse mode” was enabled for each receptor location, which assumes that the receptor (e.g. a building) is facing all directions. This is useful when the actual properties of the receptor are unknown or if there are wind turbines on more than one side of the receptor which may contribute to the flickering impact.

Shadow Receptors are defined as:

- A building
- A vacant residential parcel (e.g. a plot of land zoned as residential where no building has yet been developed)
- A roadway, or
- An intersection between two roadways.

The location of all identified shadow receptors are shown on Drawing 1. The results of the shadow model are shown on Drawing 2a and 2b and in the Tables A1, A2 and A3 in Appendix A.

As roadways are long linear features that are often bordered by vegetation (trees, forest, etc.) that blocks the visibility of the turbines, a vegetation buffer was included in the shadow model for roads. A site visit to the roads that were identified in the area confirmed that Springy Pond Road is bordered by 50 to 80 ft tall forests for its entire length. See the photolog in Appendix B or photos taken along Springy Pond Road. Pomoroy Logging Inc. is a commercial quarry and logging operation located on Springy Pond Road. The driveway into the Pomoroy Logging Inc. compound is not shaded by trees so there would be a clear line of sight to the Project. SWEB has negotiated a shadow flicker easement with Gary Pomoroy of Pomoroy Logging Inc., classifying them as a participating receptor, so any shadow flicker exposure on their property, including roads, was not considered in this model.

## **Results**

### *Buildings*

The shadow flicker model results for buildings are shown in Table A1, Appendix A. A total of 254 building receptors were located within 2 miles of the Project site. Of these 254 buildings, 233 will not receive shadow flicker exposure from the Project at either hub height. Twenty-one (21) buildings will receive shadow flicker exposure, which ranges from between 6 hours and 21 minutes (6:21) to 23:25 for the 105 m hub height turbine model, and from 6:21 to 22:22 for the 117 m hub height model.

There are no instances in which the 30h per year of shadow flicker threshold, as defined by the Wind Energy Act (WEA Constraint), is exceeded for either turbine model. However, there are 13 building receptors where the 10h per year threshold set in the Town of Clifton's Land Use Ordinance (CLUO Constraint) is exceeded for both the 105 m or 117 m turbine models. The shadow flicker model results and locations of where the thresholds are exceeded are shown on Drawings 2a and 2b. As a result of the shadow flicker exceedances, a shadow flicker curtailment schedule was developed based on the shadow flicker model results. The shadow flicker curtailment schedule is presented in Tables A4 and A5, and prescribes a curtailment schedule for each turbine for a full year down to one minute resolution. Provided that the curtailment schedule is adhered to, the shadow flicker exposure at all building receptors would be below the 10h per year CLUO threshold. The shadow flicker estimates for buildings with the curtailment plan enacted is also provided in Tables A1 and A2.

#### *Vacant Residential Lots*

The shadow flicker model results for vacant residential parcel receptors (VRPRs) are shown in Table A2 in Appendix A. A total of 17 VRPRs located within 1 mile of the Project site were modeled by centralizing a point within the parcel to represent the location of a potential future building. The shadow flicker model results show that of these 17 VRPRs, 8 will not receive any shadow flicker exposure from the Project at either hub height. Nine (9) VRPRs will receive shadow flicker exposure, which ranges from 8:55 hours and 26:25 for the 105 m hub height turbine model, and from 9:00 to 26:31 for the 117 m hub height turbine model.

There are no instances in which the 30h per year WEA Constraint is exceeded for either the 105 m or 117 m turbine model. There are seven vacant lot receptors where the 10h per year CLUO Constraint is exceeded for both the 105 m and 117 m turbine models. Vacant residential lots were also considered when the shadow flicker curtailment schedules (see Tables A4 and A5) were developed. Again, provided the curtailment schedule is adhered to, the shadow flicker exposure at all vacant residential lots will be below the 10h per year CLUO threshold as well. The shadow flicker estimates for vacant residential lots with the curtailment plan enacted is also provided in Tables A1 and A2.

#### *Roads*

The shadow flicker model results for roads are summarized in Table A3 in Appendix A. A total of 23 road points separated by 0.1 mile increments were modeled along two roads, the Bangor Water Works Road and Springy Pond Road. Factoring in the effect that the surrounding vegetation has on turbine visibility from the road, there would be no shadow flicker exposure on either of these roads for both the 105 m and 117 m turbine models.

### **Discussion and Recommendations**

#### **Shadow Flicker**

The shadow flicker models prepared for the Silver Maple Wind Project show that the majority of receptors in the area will receive little or no shadow flicker exposure. Receptors located within 1 mile to the east and west of the Project will generally be at higher risk of shadow flicker exposure owing to the path of the sun as it travels from east to west across the sky.

It should be noted that shadow flicker exposure limits are very conservative as they do not account for cloud cover which would reduce the actual shadow flicker exposure substantially. Additionally, the model assumes that the axis of the rotor rotation is always facing the receptors in the model, which would not be the case, further reducing the shadow flicker exposure. Realistically, the actual shadow flicker exposure could be expected to be 25% to 50% less than the results shown in the model, but results would vary significantly depending on weather and wind conditions.

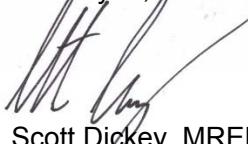

The shadow flicker exposure estimations in the model show that the 30h per year WEA Constraint was met for all receptors for both the 105 m and 117 m hub heights without any need to curtail the turbines. The 10h per year CLUO shadow flicker limit was exceeded for a number of receptors. As such, we recommend that a shadow flicker curtailment program based on the curtailment schedule (see Tables A4 and A5) be implemented, which would keep shadow flicker exposure at all receptors below the 10h per year CLUO limit.

### **Closure**

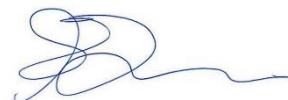

The results of these assessments are based on analysis conducted with Windpro software which is the industry standard for modeling and assessing the environmental impact of wind turbines. Additionally, the assessment guidelines and requirements prescribed by the State of Maine's Department of Environmental Protection and the Town of Clifton's Land Use Ordinance were adhered to when conducting this assessment.

## **Statement of Qualifications and Limitations**

This Report (the "Report") has been prepared by Strum Consulting ("Consultant") for the benefit of SWEB Developments USA LLC. ("Client") in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the "Agreement").

The information, data, recommendations, and conclusions contained in the Report (collectively, the "Information"):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the Report (the "Limitations")
- represents Consultant's professional judgement in light of the Limitations and industry standards for the preparation of similar reports
- may be based on information provided to Consultant which has not been independently verified
- has not been updated since the date of issuance of the Report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued
- must be read as a whole and sections thereof should not be read out of such context
- was prepared for the specific purposes described in the Report and the Agreement
- in the case of subsurface, environmental, or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time

Consultant shall be entitled to rely upon the accuracy and completeness of information that was provided and has no obligation to update such information. Consultant accepts no responsibility for any events or circumstances that may have occurred since the date on which the Report was prepared and, in the case of subsurface, environmental, or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

Consultant agrees that the Report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the Report and the Agreement, but Consultant makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

The Report is to be treated as confidential and may not be used or relied upon by third parties, except:

- as agreed in writing by Consultant and Client
- as required by law
- for use by governmental reviewing agencies

Consultant accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the Report or the Information for any injury, loss, or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the Report or

any of the Information (“improper use of the Report”), except to the extent those parties have obtained the prior written consent of Consultant to use and rely upon the Report and the Information. Any damages arising from improper use of the Report or parts thereof shall be borne by the party making such use.

This Statement of Qualifications and Limitations forms part of the Report and any use of the Report is subject to the terms hereof.

Should additional information become available, Strum requests that this information be brought to our attention immediately so that we can re-assess the conclusions presented in this report. This report was prepared by Scott Dickey, MREM, Environmental Scientist, and was reviewed by Shawn Duncan, BSc., Vice President.
