

1. Should there be dedicated care area/units for PRCs under quarantine or isolation?

Answer: Yes, dedicated care areas is the preferred option.

Dedicated Care Areas

Ideally, these areas should have physical separation but can be a cluster of rooms

- If barriers are added to create physical separation, consider:
 - **HVAC:** there should be air exchange (In/Out) in all partitioned hallways
 - **Fire Safety:** adding physical barriers may block fire safety egress routes, this will likely need approval from facility Safety Officer
- If separation is by individual or cluster of rooms:
 - Consider visual cues (e.g. signage, line of tape on floor) to alert staff
 - Resident room doors may need to be kept closed
- If limited single rooms are available or if numerous residents are simultaneously identified to have exposures or symptoms concerning for COVID-19, residents should shelter in place at their current location pending return of test results.
- Residents should only be placed in COVID-19 care unit if they have confirmed COVID-19.
- Roommates of residents with COVID-19 should be considered exposed and potentially infected and if at all possible should not share rooms with other residents while they are in quarantine

Maine Department of Health and Human Services – Maine Center for Disease Control and Prevention – Healthcare Epidemiology Program 3

2. Can a wing/unit be one half suspect PRCs and one-half negative PRC?

Answer: Yes, however do not share a bathroom between a negative room and suspect room or person(s) and appropriate PPE usage, hand hygiene, and cleaning/disinfection of shared equipment is important. If utilizing PPE supply shortage strategies, see FAQ [number 4](#).

a. Does there need to be a dividing barrier?

Answer: It is not required. May want to consider something that does not interfere with fire safety (e.g. egress) as a reminder to staff – for example: a red line on the floor. Also take into consideration how barriers may affect HVAC and air flow.

b. Can staff work with both suspect/quarantined/isolated and SARS-CoV-2 naive PRCs or does there need to be separate staff for each population?

Answer: dedicated staff for each space is recommended. If shared staffing, it is important to have appropriate PPE practices, cleaning/disinfection of shared equipment, as well as appropriate hand hygiene.

- **Ideally,**
 - Staff should be dedicated to each COVID-19 status area
 - Each area should have it's own restroom, break room, and work area
 - Assign dedicated Environmental Services (EVS) to each COVID-19 status area
- **Restrict access of ancillary staff to COVID-19 positive areas.**
- **Place signage at entrance to each COVID-19 care area, list PPE needed for that area**

3. How should I look at placement of suspect/quarantined/isolated PRCs? What about cohorting?

Answer:

Patient / Resident Placement for SARS-CoV-2

Resident Type/Scenario	Room (Ideally)	Bathroom	Placement Additional Notes	Transmission-Based Precautions	PPE
Ideally, it is best to have dedicated staff & have patients/residents cared for in a dedicated area , with consideration of resident-types:					
Quarantined	Private	<ul style="list-style-type: none"> Private / separated from others If a commode is used to physically separate bathroom usage, consideration should be taken to where that commode is emptied and cleaning/disinfection of the bathroom after. 	<ul style="list-style-type: none"> Preferably, should be physically separated from other rooms and non-SARS-CoV-2 patients/residents if a mixed unit. <i>Note: placing them with another quarantined individual could put both at more risk for contracting SARS-CoV-2 if one of the two persons is infected and one is not.</i> 	<p>Yes</p> <p>(Standard, Airborne, Contact & Droplet)</p>	<p>Full PPE for duration of quarantine</p> <p>[NIOSH-approved N95 or equivalent or higher-level respirator, gown, gloves, and eye protection (i.e., goggles or a face shield that covers the front and sides of the face)]</p>
Symptomatic status pending	Private	<ul style="list-style-type: none"> Private / separated from others If a commode is used to physically separate bathroom usage, consideration should be taken to where that commode is emptied and cleaning/disinfection of the bathroom after. 	<ul style="list-style-type: none"> Preferably, should be physically separated from other rooms and non-SARS-CoV-2 patients/residents if a mixed unit. If confirmed SARS-CoV-2 positive, move to dedicated area (when available). See "positive for SARS-CoV-2". 	<p>Yes</p> <p>(Standard, Airborne, Contact & Droplet)</p> <p>Until infectious etiology identified---Then institute appropriate transmission-based precautions based on disease type, if necessary.</p> <p>•If SARS-CoV-2 positive by testing, continue TBP/isolation and see "positive for SARS-CoV-2".</p>	<p>Full PPE until infectious etiology is identified.</p> <p>[NIOSH-approved N95 or equivalent or higher-level respirator, gown, gloves, and eye protection (i.e., goggles or a face shield that covers the front and sides of the face)]</p> <p>•Then institute appropriate PPE for disease type, if necessary.</p>
Positive for SARS-CoV-2	Private	<ul style="list-style-type: none"> Private / separated from others If a commode is used to physically separate bathroom usage, consideration should be taken to where that commode is emptied and cleaning/disinfection of the bathroom after. 	<p>Preferably, should be physically separated from other rooms and non-SARS-CoV-2 patients/residents if a mixed unit.</p>	<p>Yes</p> <p>(Standard, Airborne, Contact & Droplet)</p>	<p>Full PPE for duration of isolation</p> <p>[NIOSH-approved N95 or equivalent or higher-level respirator, gown, gloves, and eye protection (i.e., goggles or a face shield that covers the front and sides of the face)]</p>

Notes:

- When looking to cohort, you want to do so in a way that provides the highest risk mitigation.
 - If cohorting of quarantined PRCs must occur due to capacity, then take the following into consideration when looking at level of risk –with goal of not placing higher risk PRC with a lower risk PRC:
 - How far into quarantine are the PRCs?
 - Is daily symptom monitoring or testing occurring?
 - Are the PRCs immunocompromised?
 - Was the level of risk of the exposure that put the PRC in quarantine of higher or lower risk?
 - Can the PRC mask, practice appropriate hygiene (hand hygiene, toileting, etc.), physical distancing (as much as feasible) in the room?
 - What is the air exchange capabilities of the space/room they will be placed in?
 - How often are the rooms cleaned/disinfected?
- Want to additionally consider what may be transmitted between roommates, such as multi-drug resistant organisms (MDROs) [e.g. MRSA, VRE, ESBL, CRE, Candida auris] or other potentially transmissible organisms.

SARS-CoV-2 Positive

- Can cohort positive residents (unless MDRO or other infectious disease conditions present)

SARS-CoV-2 Quarantine

- Each resident in quarantine, ideally, should have a private room with a private bathroom

SARS-CoV-2 Negative

- Can cohort negative residents (unless MDRO or other infectious disease conditions present)

4. Can staff continue to wear PPE between populations of cohorted PRC?

Answer: Consideration should first be made to determine if the facilities PPE supply is sufficient to sustain Conventional Capacity. If Contingency or Crisis Capacity are necessary, see guidance on following website for full implementation recommendations:
