EXECUTIVE SUMMARY

PURPOSE

The Maine Shared Community Health Needs Assessment (Maine Shared CHNA) is a collaborative effort amongst Central Maine Healthcare (CMHC), MaineGeneral Health (MGH), MaineHealth (MH), Northern Light Health (NLH), and the Maine Center for Disease Control and Prevention (Maine CDC), an office of Maine Department of Health and Human Services. This unique public-private partnership is intended to assess the health needs of all who call Maine home.

• **Mission:** The Maine Shared CHNA is a dynamic public-private partnership that creates shared Community Health Needs Assessment reports, engages and activates communities, and supports data-driven health improvements for Maine people.

• **Vision:** The Maine Shared CHNA helps to turn data into action so that Maine will become the healthiest state in the US.

TOP HEALTH PRIORITIES

Forums held in Penobscot and Piscataquis Counties identified health issues in their communities through a voting methodology outlined in the Methodology section of this report (Appendix C). Table 2 includes a list of those priorities that were identified in both Penobscot and Piscataquis Counties.

NEXT STEPS

This assessment report will be used to fulfill the Internal Revenue Service (IRS) requirements for non-profit hospitals as well as the Public Health Accreditation Board (PHAB) requirements for state and local public health departments. Required activities include:

- Obtaining input from the community, including providers and communities served, on leading health issues and unmet needs
- Evaluating previous actions taken to address needs identified in previous assessments
- Choosing (with justification) which health needs should be addressed
- For District Coordinating Councils, creating District Health Improvement Plans
- For the Maine CDC, creating an informed State Health Improvement Plan

In the coming months and years, policymakers, non-profits, businesses, academics, and other community partners may also use these reports for their own strategic planning purposes.
ACKNOWLEDGEMENTS

Funding for the Maine Shared CHNA is provided by four healthcare systems: Central Maine Healthcare, MaineGeneral Health, MaineHealth, and Northern Light Health, with generous in-kind support from the Maine CDC, and countless community partners and stakeholder groups. These stakeholder groups include the Metrics Committee, Data Analysis workgroup, Community Engagement Committee, Local Planning Committees, and the Steering Committee. Special thanks to the Maine Health Data Organization for working with us to access their data. For a listing please visit www.mainechna.org and click on, “About Maine CHNA.”

Significant analysis was conducted by epidemiologists at the Maine CDC and the University of Southern Maine’s Muskie School of Public Service. John Snow, Inc. (JSI) provided analysis, methodology, and design support.

In addition, the Steering Committee gratefully acknowledges the countless community volunteers who gave their time and passionately committed to hosting, facilitating, attending, and engaging in this effort. From Aroostook to York, Oxford to Washington County, over 2,000 Mainers gave their time and talent to this effort. Thank you.
HEALTH PRIORITIES

Health priorities for the county, public health district, and the state were developed through community participation and voting at community forums. The forums were an opportunity for review of the County Health Profiles, discussion of community needs, and prioritization in small breakout sessions followed by forum session votes. Table 3 lists all priorities that arose from group breakout sessions in each of the counties that make up the Penquis District. The priorities in bold font represent the top priorities within each county. The shaded priorities are those that were common across both Penobscot and Piscataquis Counties. Please see Appendix C for full description of the methodology used in identifying top priorities.

This section provides a synthesis of findings for each of the top priorities that arose in each county. The discussion of each priority draws from several sources, including the data in the Penquis District Health Profile, information gathered through community engagement discussions at the community forums, and key informant interviews. See Appendix C for the complete methodology for all of these activities.

MENTAL HEALTH

Mental health affects all segments of the population, regardless of age, socioeconomic status, race/ethnicity, sexual orientation, or gender. Poor mental health contributes to a number of challenges that affect both individuals and communities. Mental health conditions, when left unmanaged, may affect an individual’s ability to form and maintain relationships with others, cope with challenges, and lead a healthy and productive life. Individuals with serious mental illness (e.g., major depression or schizophrenia) are at a higher risk of developing other medical conditions, including cardiovascular disease, diabetes, stroke, and Alzheimer’s disease. While the reason for this link is unclear, research suggests that those with mental illness may experience more barriers to medical care and prevention strategies and may also find it harder to care for themselves.¹

More than 25% of adults with a mental health condition also have a substance use disorder; this comorbidity occurs more among adults with depression, anxiety disorders, schizophrenia, and personality disorders. While mental health conditions may lead to drug or alcohol use, the reverse can also be true: the use of certain substances may cause individuals with substance use disorder to experience symptoms of a mental health condition.²

QUALITATIVE EVIDENCE

Forum participants cited depression, anxiety, stress, and suicidality as the major mental health concerns in Penquis District. Forum participants discussed specific mental health treatment services in their counties:

- Penobscot County forum participants discussed the need for inpatient services, specialty providers for youth and older adults, and integration of behavioral health and primary care.
- Piscataquis County forum participants identified counseling and crisis treatment as specific gaps in the spectrum of care.

In both counties, forum participants mentioned the mental health needs of youth and adolescents as a particular concern.

- In Penobscot County, Adverse Childhood Experiences (ACEs), bullying, the impact of social media, and stress were thought to be underlying issues that contributed to the increase in depression amongst young people. Community members suggested behavioral health education, screening, and treatment should be provided as early as pre-kindergarten (pre-K). School personnel, particularly school nurses, counselors, and health teachers, were identified as critical partners in the early identification and treatment of mental health conditions.
- In Piscataquis County, participants also identified ACEs as a risk factor for youth mental health conditions.

Besides youth, community forum participants in Piscataquis County identified older adults and the lesbian, gay, bisexual, transgender, and queer/questioning (LGBTQ) community as segments of the populations that were at risk for poor mental health. Forum participants discussed the need for increased education and counseling in schools. For the LGBTQ community, participants identified the need for culturally competent resources, especially for LGBTQ youth. Key informants working with the LGBTQ population explained that medical professionals are provided with little training and education about how to meet the needs of non-heterosexual individuals.

Stigma, or the disapproval or discrimination against a person based on a particular circumstance (e.g. mental health condition) was identified by several forum participants as a major barrier to seeking and receiving health care. Stigma prevents individuals from receiving the help they need, as individuals with a mental health condition may not seek care for fear that they will be shamed or discriminated against. Community members called for more education around mental health conditions, for both providers and residents, to reduce burden and stigma.
QUANTITATIVE EVIDENCE

In the Penquis District:

- The percentage of adults who reported 14 or more days lost due to poor mental health in the past 30 days was significantly higher than the state overall (23.3% vs. 16.7%) in 2014-2016.

- In Penobscot County, the percentage of high school students who reported that they had been sad/hopeless for more than two weeks in a row increased significantly between 2011 and 2017, from 22.5% to 28.3%.

- In Piscataquis County, the percentage of high school students who reported that they had been sad/hopeless for more than two weeks in a row increased significantly between 2011 and 2017, from 21.8% to 32.5%. The percentage was significantly higher than the state overall (26.9%).

- In Piscataquis County, the percentage of high school students who reported having seriously considered suicide increased significantly between 2011 and 2017, from 9.6% to 17.4%.

- The ratio of psychiatrists to 100,000 population was lower than the state overall (5.7 vs. 8.4) in 2017.

See Key Indicators on page 23 as well as the Penquis District Health Profile and individual county data reports on our website www.mainechna.org. Those documents also include information on data sources and definitions.
COMMUNITY RESOURCES TO ADDRESS MENTAL HEALTH

The table below is a summary of the assets and needs identified through the community engagement process, including review by local teams. It is important to note that this is not a complete list of available resources or existing needs in the community; other resources, like 211 Maine, and local/county resource guides should be referenced as a more comprehensive inventory. Assets and gaps/needs in bold text were identified in both Penobscot and Piscataquis Counties.

SOCIAL DETERMINANTS OF HEALTH

The social determinants of health are the conditions in which people live, work, learn, and play that affect their health; factors include socioeconomic status (e.g., education, income, poverty), housing, transportation, social norms and attitudes (e.g. racism and discrimination), crime and violence, literacy, and availability of resources (e.g. food, health care). These conditions influence an individuals' health and define quality of life for many segments of the population, but specifically those that are most vulnerable. According to the Kaiser Family Foundation, social factors like education, racism, and poverty accounted for over a third of total deaths in the United States.³

Food insecurity refers to a lack of resources to access enough nutritional food for a household. Food insecurity has both direct and indirect impacts on health for people of all ages, but is especially detrimental to children.⁴ Chronic diseases and health conditions associated with food insecurity include asthma, low birthweight, diabetes, mental health conditions, hypertension, and obesity.⁵

QUALITATIVE EVIDENCE

A dominant theme from key informant interviews and the community forums in the Penquis District was the tremendous impact that the underlying social determinants have, particularly food insecurity, housing, and transportation. Poverty was often at the root of these issues; without stable employment and a livable wage, many people struggle to afford nutritious foods and to secure and maintain affordable and safe housing and transportation.

- In Penobscot County, many participants identified a need for resources to combat the causes and effects of poverty, including increased job education and training, financial management classes, and home economics courses in schools.
- In Piscataquis County, forum participants identified the intersection of poverty and rurality as the root cause of many health needs. Those that are rural and poor tend to have more uninsured residents, fewer options for transportation, and higher rates of unemployment – all of which holds true in Piscataquis County.

Access to affordable and reliable forms of transportation was problematic in Penquis District, not only because it affects one’s ability to access health care, but other goods and services (e.g. employment, groceries, socializing, etc.) Though there were options for public transportation, residents suggested that buses should run more frequently and for longer periods of time.

Housing was identified as an issue in the District.

- In Penobscot County, forum participants cited a need for safer housing and radon testing. There was also a need for transitional and supportive housing for those in recovery from substance use disorder.
- In Piscataquis County, homeless adults were identified as a population in need of support.

Forum participants in both counties felt that there were issues around food insecurity.

- In Penobscot County, the cost of fresh and nutritious food was cost prohibitive farmers markets were difficult to access due to limited hours. Participants were also concerned about children’s access to healthy foods, both within and outside of schools; it was suggested that schools expand offerings of low cost and healthy lunch to students.
- In Piscataquis County, participants identified many community assets in the realm of nutrition and healthy foods, yet many still saw a gap in services and resources.
QUANTITATIVE EVIDENCE

In the Penquis District:

- The percentage of children living in poverty was higher than the state overall (19.5% vs. 17.2%) in 2012-2016.

- In Penobscot County, the percentage of individuals living in poverty was higher than the state overall (16.3% vs. 13.5%) in 2012–2016.

- In Piscataquis County, the percentage of individuals living in poverty was higher than the state overall (20.6% vs. 13.5%) in 2012–2016.

- In Penobscot County, the percentage of high school students who are housing insecure was higher than the state overall (4.1% vs. 3.6%) in 2017.

- In Piscataquis County, the unemployment rate was higher than the state overall (5.1% vs. 3.8%) in 2015–2017. The median household income was over $10,000 less than the state overall—$36,938 vs. $50,826 in 2012-2016.

- In Piscataquis County, the percentage of households that lack enough food to maintain healthy, active lifestyles for all household members was higher than the state overall (16.8% vs. 15.1%) in 2014-2015.

See Key Indicators on page 23 as well as the Penquis District Health Profile and individual county data reports on our website www.mainechna.org. Those documents also include information on data sources and definitions.
COMMUNITY RESOURCES TO ADDRESS SOCIAL DETERMINANTS OF HEALTH

The table below is a summary of the assets and needs identified through the community engagement process, including review by local teams. It is important to note that this is not a complete list of available resources or existing needs in the community; other resources, like 211 Maine, and local/county resource guides should be referenced as a more comprehensive inventory. Assets and gaps/needs in bold text were identified in both Penobscot and Piscataquis Counties.

</table>
ACCESS TO CARE

Whether an individual has health insurance and the extent to which it helps to pay for needed acute services and access to a full continuum of high-quality, timely and accessible preventive and disease management or follow-up services is critical to overall health and well-being. Access to a usual source of primary care is particularly important, since it greatly affects the individual’s ability to receive regular preventive, routine and urgent care and to manage chronic conditions.

Barriers to accessing care also include the availability and affordability of care. Low-income individuals, people of color, those with less than a high school diploma, and LGBTQ populations face even greater disparities in health insurance coverage compared to those who are straight, white, and well educated. For example, in Maine, over 20.3% of American Indian/Alaska Native adults report they are unable to receive or have delayed medical care due to cost, compared to 10.3% of white adults. Compared to heterosexual residents (11.6%), 19.3% of bisexual residents, and 22.5% of residents who identified as something other than heterosexual, gay or lesbian, or bisexual, were uninsured. More information on health disparities by race, ethnicity, education, sex, and sexual orientation can be found in the Health Equity Data Summaries, available at www.mainechna.org.

QUALITATIVE EVIDENCE

In Penquis District forums, participants and key informants identified the social determinants of health, particularly inability to access reliable and affordable forms of transportation, as significant barriers to care. These are discussed in more details in the “Social Determinants of Health” section of this report.

Beyond the need for Medicaid expansion, which was signed into law on January 3, 2019, participants in both counties discussed the need for comprehensive and affordable health services. Even for those with insurance, deductibles, co-pays, and prescription medications are unaffordable and prevent people from seeking care. The out-of-pocket costs associated with some forms of care deter people from getting the services or medications that they need.

• In Penobscot County, participants identified a need for more primary care, dental care, behavioral health, and prenatal care.
• In Piscataquis County, participants identified a need for dental care, substance use specialists, mental health counselors, home health services, walk-in clinics, and oncology. Participants also identified access to clinics or health services where payments could be made on a sliding scale based on income. For those with MaineCare, access to behavioral health and dental health services were particularly limited.

QUANTITATIVE EVIDENCE

In the Penquis District:

• The percentage of the population that was uninsured was higher than the state overall (10.7% vs. 9.5%) in 2012-2016.
• The ratio of primary care physicians to 100,000 population was lower than the state overall (55.2 vs. 67.3) in 2017.
• In Penobscot County, the percentage of the population who reported an inability to access healthcare due to cost was slightly higher than the state overall (11.5% vs. 10.3%) from 2014–2016.
In Piscataquis County, the percentage of adults who visited a dentist in the past year was significantly lower than the state overall (55.5% vs. 63.3%) in 2016. See Key Indicators on page 23 as well as the Penquis District Health Profile and individual county data reports on our website www.mainechna.org. Those documents also include information on data sources and definitions.

**COMMUNITY RESOURCES TO ADDRESS ACCESS TO CARE**

The table below is a summary of the assets and needs identified through the community engagement process, including review by local teams. It is important to note that this is not a complete list of available resources or existing needs in the community; other resources, like 211 Maine, and local/county resource guides should be referenced as a more comprehensive inventory. Assets and gaps/needs in bold text were identified in both Penobscot and Piscataquis Counties.

SUBSTANCE USE

The Substance Abuse and Mental Health Services Administration (SAMHSA) estimated that 8% of adults in the United States have had a substance use disorder in the past year. Tobacco, alcohol, marijuana, and nonmedical use of prescription pain relievers (e.g., OxyContin, Vicodin) are the leading substance use health issues for adults. Tobacco, alcohol, and marijuana are the most common substances used by adolescents, followed by amphetamines (e.g., Adderall) and nonmedical use of prescription pain relievers. Those with substance use disorders often face a number of barriers that limit access and hinder engagement in care; one study estimates that more than 50% of individuals with mental health and substance use issues are not engaged in needed services. Barriers to care include a lack of education, awareness, and understanding around the signs, symptoms, risk factors, and consequences associated with substance use, social stigma, and workforce shortages. Statewide, many forum participants and key informant interviewees identified gaps in access to substance use treatment and recovery services. Finally, those who are uninsured or underinsured are more likely to face barriers to care, and historically, coverage for substance use services has been less comprehensive than for physical health services. This is further complicated by the cost of co-pays, transportation, and medications, even for those who are eligible for free or discounted services, or for those with commercial insurance, as many private substance use treatment providers do not accept insurance and require cash payments.

QUALITATIVE EVIDENCE

Forum participants in both forums discussed the need for more comprehensive, accessible, and affordable services to help those with substance use issues.

- In Piscataquis County, the need for counselors, recovery coaches, and support groups like Alcoholics Anonymous and Narcotics Anonymous were identified as specific gaps in the spectrum of care.

The impact of opioids was a major theme in both counties.

- In Penobscot County, participants discussed the need for services, including recovery coaches and case managers. At the community level, participants suggested that residents would benefit from education around coping mechanisms and breaking down stigma, which was identified as a barrier to substance use treatment.

- In Piscataquis County, forum participants felt that opioid use was the leading issue for individuals between the ages of 20 and 60. Participants suggested poverty as a risk factor for heroin use, as it is more accessible than prescription drugs.

In both counties, the increased availability, marketing, and use of e-cigarettes, also referred to as “vaping” or “Juuling,” was a critical concern for youth. Key informants identified a number of priority health issues for individuals with substance use disorders and those in treatment/recovery: education and outreach around how to access healthcare and treatment options, routine basic health care (primary care, dental care), and care that addresses co-occurring mental health and substance use issues. Informants also identified needs specific to youth, including information on where and how to access treatment and better access to confidential services.

QUANTITATIVE EVIDENCE

In the Penquis District:

- The percentage of adults who currently smoke cigarettes was higher than the state overall (24.2% vs. 19.8%) in 2016.

- Past-30-day cigarette smoking amongst high school students was higher than the state overall (9.2% vs. 8.8%) in 2017.

- In Penobscot County, the overdose emergency medical service responses per 10,000 population were higher than the state overall (128.0 vs. 93.0) in 2016-2017.
In Piscataquis County, past-30-day use of prescription drugs amongst middle school students was significantly higher than the state overall (3.6% vs. 1.5%) in 2017.

COMMUNITY CHARACTERISTICS

AGE DISTRIBUTION

Age is a fundamental factor to consider when assessing individual and community health status; older individuals typically have more physical and mental health vulnerabilities and are more likely to rely on immediate community resources for support compared to young people.\textsuperscript{10} With an aging population comes increased pressure on the healthcare system and shortages in the healthcare workforce, especially geriatricians, nurses, social workers, and direct care workers like home health aides and certified nursing assistants, to meet the needs of older adults.\textsuperscript{11}

- In Penobscot County, 16.5\% of the population is 65 years of age or older.
- In Piscataquis County, 23.5\% of the population is 65 years of age or older.

The following is a summary of findings related to community characteristics for the Penquis District counties. Conclusions were drawn from quantitative data and qualitative information collected through forums and key informant interviews.

The following companion reports are available at \url{www.mainechna.org}.
- Penobscot County Health Profile and CHNA Report
- Piscataquis County Health Profile and CHNA Report
- Penquis District Health Profile
- Maine State Health Profile and CHNA Report
- Health Equity Data Summaries

RACE/ETHNICITY

An extensive body of research illustrates the health disparities that exist for racial/ethnic minorities, non-English speakers, and foreign-born populations. According to the Centers for Disease Control and Prevention (CDC), non-Hispanic blacks have higher rates of premature death, infant mortality and preventable hospitalization than non-Hispanic whites.\textsuperscript{12} Individuals with limited English proficiency (LEP), defined as the ability to read, speak, write or understand English “less than very well,” have lower levels of medical comprehension. This leads to higher rates of medical issues and complications, such as adverse reactions to medication.\textsuperscript{13,14} Cultural differences such as, but not limited to, the expectations of who is...
involved in medical decisions can also impact access to health care and to health information. These disparities show the disproportionate and often avoidable inequities that exist within communities and reinforce the importance of understanding the demographic makeup of a community to identify populations more likely to experience adverse health outcomes.

### SOCIOECONOMIC STATUS

Socioeconomic status (SES) is measured by such things as income, poverty, employment, education, and neighborhood characteristics. Individuals with low SES are more likely to have chronic health issues, die prematurely, and have overall poor health. Low-income status is highly correlated to a lower than average life expectancy. Lack of gainful employment is linked to several barriers to care, such as lack of health insurance, inability to pay for health care services, and the inability to pay for transportation to receive services. Higher education is associated with improved health outcomes and social development at individual and community levels.

The health benefits of higher education typically include better access to resources, safer and more stable housing, and better engagement with providers. Factors associated with low education impact an individual’s ability to navigate the healthcare system, disparities in personal health behaviors, and exposure to chronic stress.

It is important to note that, while education affects health, poor health status may also be a barrier to education. Tables 9 includes a number of data points comparing Penquis District counties to the state of Maine overall.

### SPECIAL POPULATIONS

Through community engagement activities, several populations in the Penquis District were identified as being particularly vulnerable or at-risk for poor health or health inequities.

**Youth**

Youth were identified as a priority population in the community forum. Specific issues of concern were youth mental health conditions (specifically depression, anxiety and stress), substance use (particularly e-cigarettes/vaping), and lack of education and promotion around nutrition and physical activity. One key informant who works with youth also identified a need for them to be able to access low-cost and anonymous health services, specifically reproductive and substance use services, without parent permission.

| 65+ living alone | — / 45.3% |

Data Source: US Census Bureau, American Community Survey, 2012-2016
Low-Income/Rural

Piscataquis County is the only county in Maine where 100% of the population lives in a rural area. Nationally, an ever-evolving economic structure has placed extra strain on individuals and families living in large rural areas with low population density; some of the most well-known causes and conditions of hardship include a lack of and outsourcing of jobs, limited long-term employment opportunities, barriers to accessing health care services, and the need for a personal vehicle. Generational poverty—when a family has lived in poverty for at least two generations—differs from situational poverty in that it typically includes the constant presence of hopelessness. This lack of hope and near-constant state of perpetual crisis creates a cycle of poverty that persists from one generation to the next. Forum participants in Piscataquis County identified low-income individuals, families, and older adults as populations that were particularly vulnerable to poor health.

Older Adults

Maine is the oldest state in the nation by median age. Older adults are more likely to develop chronic illnesses and related disabilities, such as heart disease, hypertension, diabetes, depression, anxiety, Alzheimer’s disease, Parkinson's disease, and dementia. They also lose the ability to live independently at home. According to qualitative information gathered through interviews and the Piscataquis County Community Forum, issues around healthy aging and the health of older adults were priorities in Piscataquis County—specifically barriers to access to care for older adults (e.g. transportation, limited financial resources) and depression/isolation.

In addition to the data collected and analyzed for the County Health Profiles, the Maine CDC created Health Equity Data Summaries (available at www.mainechna.org) which provides selected data analyzed by sex, race, ethnicity, sexual orientation, education, and income. These data are at the state level, as much of the county level data would be suppressed due to small numbers and privacy concerns, and the previous analyses have shown that health disparities found at the state level are generally similar in individual counties.
KEY INDICATORS

The Key Indicators provide an overview of the health of the district and of each county within the district. They are a broad sampling of health topics, including health behaviors, outcomes, living conditions, and health care quality and access.

The tables use symbols to show if the data for each district or each county within the district is notably better or worse than the state.

APPENDIX B: HISTORY AND GOVERNANCE

Maine is one of the few states in the nation that conducts a shared public-private statewide community health needs assessment—the Maine Shared CHNA—which was born out of a unique public-private partnership. The partnership began as the OneMaine Health Collaborative in 2007, involving Northern Light Health (formerly Eastern Maine Healthcare Systems), MaineGeneral Health, and MaineHealth. After conversations with the Statewide Coordinating Council for Public Health, the Maine Center for Disease Control and Prevention, an office of the Department of Health and Human Services joined in 2012. In 2013, Central Maine Healthcare (CMHC) joined the group and in 2014, leadership from the signatory partners signed a formal Memorandum of Understanding outlining mutual goals and expectations. A charter was drafted by all five partners to guide a statewide assessment process.

The Maine Shared CHNA is intended to coordinate state and county needs assessments to meet the needs of hospitals, to support state and local public health accreditation efforts, and to provide valuable population health assessment data for a wide variety of organizations across Maine. Our vision is to turn data into action so that Maine will become the healthiest state in the nation.

The Metrics Committee drafted the list of data indicators, and the Community Engagement Committee drafted a method to ensure a robust community engagement process—both of which were approved by the Steering Committee. Each committee was led by the Program Manager, who was the primary point of contact for all entities and partners and was responsible for drafting and implementing the work plans which drove this process. A more detailed outline of these efforts follows. For more information about the committee structure and our partners, please visit the “About Us” page on our website www.mainechna.org.

The Community Engagement Committee is charged with making recommendations for approval by the Steering Committee outlining a consistent and robust community engagement process. This process should identify priorities among significant health issues and identify local, regional, or statewide assets and resources that may potentially address the significant health needs identified. Members of the Community Engagement Committee share their expertise to create processes and deliverables for the Steering Committee to review and approve. Members of the Community Engagement Committee include representatives of the Steering Committee, public health system partners, Federally Qualified Health Centers, academia, non-profits, and others with experience in epidemiology.
APPENDIX C: METHODOLOGY

Per the Maine Shared CHNA charter, the effort was conducted by the Steering Committee, Metrics Committee, and Community Engagement Committee. The Community Engagement Committee was led by the program manager who was the point of contact for all entities and partners and was responsible for meeting planning and facilitation. These committees worked in partnership with the Maine CDC and the contracted vendor, JSI. Maine CDC and its epidemiology contractor, University of Southern Maine, provided a significant amount of data analyses, technical support, and website development. JSI was contracted to support forum facilitation, a subset of data analysis, profile development, and report writing.

The Maine Shared CHNA process was rolled out in three stages:

Data Analysis

- **County Health Profiles** were released in September 2018. Two hundred indicators were selected to describe health outcomes, health behaviors, healthcare access and quality, and the social, community, and physical environments that affect health and wellness.
- **District Health Profiles** were released in November 2018.
- **City Health Profiles** for Lewiston/Auburn, Bangor, and Portland were released in January 2019.

Outreach and Engagement

- **Community outreach** was conducted between September 2018 and January 2019. Community forums with residents and service providers were held in all 16 counties. All forms of engagement included forums and key informant interviews. Some local planning teams also conducted additional targeted outreach, focus groups, and surveys. The purpose of this outreach was to gather feedback on data and to identify health priorities, community assets, and gaps in resources to be used in health improvement planning.

Final Reports

- Final CHNA reports for the state, each county, and districts were released in April 2019. These reports included information from the health data profiles, summaries of qualitative information gathered from engagement activities, and a presentation of community health priorities.

DATA ANALYSIS

The Metrics Committee identified the approximately 200 health indicators from over 30 sources to be used for the Maine Shared CHNA. The initial list was based on the indicators from the 2016 effort. This list was first scored against the following set of criteria:

- Was it already analyzed for a Maine CDC program?
- Is the data from this indicator collected within the last few years?
- Does it “round out” the description of population health?
- Does it address one or more social determinants of health?
- Does it describe an emerging health issue?
- Does it measure something “actionable” or “impactful”?
- Does the indicator measure an issue that is known to have high health and social costs?

Further refinement included ensuring a mix of Outcomes, Behaviors, Healthcare Access and Quality, as well as Social, Community, and Physical Environment Measures. The final list was then arranged under the current 24 health topics as outlined in the Data Health Profiles.

The Metrics Committee, led by Maine CDC staff, then drafted a data analysis plan that included which indicator was to be analyzed by which demographic characteristics (i.e. gender, race/ethnicity, sexual orientation, income, educational attainment, and insurance status), and geographic stratification (state, public health district, county, and city). This analysis plan was then approved by the Steering Committee.
The Data Analysis Workgroup used the set of indicators and the data analysis plan, as laid out by the Metrics Committee, and collected and analyzed the data. Members of the Data Analysis Workgroup shared their years of epidemiological and data analysis experience and knowledge of best practices to inform all aspects of the final health profiles at the county, public health district, city, and state level. This included not only the data analysis but recommendations on best practices for data presentation and visualization.

The Data Analysis Workgroup met weekly from March through August 2018 to discuss and coordinate an approach for analysis and data sharing between the University of Southern Maine (USM), Maine CDC, and John Snow, Inc. (JSI). The group developed rules regarding time frame (e.g., comparisons across time were to be of periods of equal duration; the most recent data used was from 2010 to present), handling complexity (e.g., how to combine years of data when an indicator’s data definition changed over time, such as ICD9/ICD10 coding or BRFSS question changes), benchmarking, map and graph formats, and iconography to be used in profile tables. Some of the methodologies are documented in the Data Definitions section of each health profile. More is provided in the “2018 Maine Shared CHNA Data Analysis Technical Definitions” posted on the Maine Shared CHNA website.

OUTREACH AND ENGAGEMENT

Community outreach and engagement for the Maine Shared CHNA included coordination at both the statewide, public health district, and county level. The statewide Community Engagement Committee met monthly from March 2018 through January 2019 to review and provide input on every aspect of engagement process.

In addition to the state-level Community Engagement Committee, a Local Community Engagement Planning Committee in each of Maine’s 16 counties planned and implemented the logistics of community forums and events within each district. These committees were comprised of hospitals, public health district liaisons, and a variety of additional partners.

Data Health Profiles include:

- 1 State Health Profile
- 16 County Health Profiles
- 5 Public Health District Profiles (for those Public Health Districts comprised of multiple counties)
- 3 City Health Profiles (Bangor, Lewiston/ Auburn, and Portland)
- 6 Health Equity Data Sheets, one for each of the following demographic characteristics:
  - Sex
  - Race
  - Hispanic ethnicity
  - Sexual orientation
  - Educational attainment
  - Insurance status

These reports, along with an interactive data form, can be found under the Health Profiles tab at www.mainechna.org.

The 2018 Community Engagement Toolkit was designed to assist the Local Community Engagement Planning Committees in this effort.

Forums and Health Priorities

Criteria for visualizing data included areas identified as a health priority in the last CHNA, significant changes in the data over time, or where a county’s data was notably better or worse than the state or the nation. Forum agenda items included remarks from health leaders; a review of previous health improvement efforts; a review of county-level data, discussion, and prioritization in small groups; and an overall forum-wide voting process. The Community Engagement and Steering Committees created and approved a rubric to guide the selection criteria for the subset of data to be presented in each forum’s PowerPoint presentations.

Small groups had 35-45 minutes to discuss the data in the presentation and the full county profile, and to share their own experiences in order to identify their top county health priorities. Table facilitators guided these discussions using key questions and worksheets.
for reporting purposes. Health priorities identified during these small groups were collated and presented to the larger plenary session, where each attendee voted for their top four priorities. Votes were tallied and a hierarchy emerged.

The summary votes for each forum were used to develop the county level priorities. If multiple forums were held in a county, the forum results for forums held with the general community were included in the total votes for the county. In cases where a forum was held with a specific population, for example, LGBTQ youth or older adults, then the results of their voting and discussion were included in the section describing the needs of that particular population. To arrive at the top countywide community health issues, votes from the broad community forums were combined for each of the priority areas to identify priority areas which fell within 70% of the combined voting total.

To arrive at the top countywide community health issues, votes from the broad community forums were combined for each of the priority areas to identify priority areas which fell within 70% of the combined voting total. Priorities that fell within the 70% combined voting total received an in-depth analysis within the Maine Shared CHNA county report.

**Penquis District Forums**

Two community forums were held in the Penquis District.

| Community Forum                 | Dover-Foxcroft 09/18/2018 | JSI | 61 |
Key informant interviews
The Steering Committee identified ten categories of medically underserved and vulnerable populations to ensure their input was heard and captured. A list of 80 potential interview subjects was created with statewide input. Selected key informants either had lived experience in the category and/or worked for an organization that focused on providing services or advocacy to a population. The populations identified were:

- Veterans
- Adults ages 65 and older who are isolated or have multiple chronic conditions
- Non-English speakers, undocumented individuals, immigrants, and refugees
- Deaf individuals and those with other physical disabilities
- Adolescents/youth
- LGBTQ
- People with mental health conditions and developmental disabilities
- Rural individuals
- Individuals in substance use disorder recovery/substance use disorder prevention and treatment professionals

The key informant interview guide was developed with input from the Community Engagement and Steering Committee members and consisted of the following five questions.

- We are interested in learning more about the priority health needs for this population (reference population(s) of expertise of interviewee). How would you characterize the health needs for this population? How are they different than for the general population?
- From where you sit and the work you do, what do you feel are the most important health needs to address? Why?
- What do you see as the major resource gaps with respect to health and wellness for this population?
- Are you currently working on anything that contributes to community health and wellness for this population? Are there any areas of health you would like to work on in partnership with others?
- Are there any particular assets or resources to address the needs of this population that can be leveraged?

Thirty-one interviews were conducted by JSI and 11 by members of Local Community Engagement Planning Committees. Information gathered from the key informant interviews is included in discussions where applicable in the county level report within each of the county priorities. For example, when discussing substance use, a discussion of the needs of vulnerable populations within this priority was also included. The state level report provides a summary of key findings from these interviews for each of the ten vulnerable populations.

For full lists of individuals representing broad interests of the community who were consulted during the engagement process, please see Penobscot and Piscataquis Needs Assessment Reports at www.mainechna.org.

Data collection
All outcomes from these efforts were collected via the Community Outreach Reporting Tool or the Key Informant Reporting tool. Both of these collection tools were online surveys within Survey Monkey. Other data collection tools included Table Facilitators notes, forum registrations, and sign-ins.

FINAL REPORTS
Integrated analysis of all quantitative and qualitative activities and findings was conducted between December 2018 and January 2019. These were used to develop a full description of the risk factors underlying the health priorities for each county.
