## CHAPTER 1 OVERVIEW OF MEA MATHEMATICS AND ENGLISH LANGUAGE ARTS/LITERACY

The Maine Educational Assessment (MEA) includes the eMPowerME assessments in mathematics and English language arts (ELA)/literacy, which are administered to all students in grades 3-8 via standard administration and/or administration with accommodations. The tests were administered to approximately 78,000 students in March and April 2018. Third-year high school students were administered the SAT in April 2018.
eMPowerME is designed to be the measure of Maine's academic content standards in mathematics and ELA/literacy, the 2011 Maine Learning Results (MLRs),and to identify the knowledge and skills essential to prepare Maine students for college- and career-readiness (CCR). These academic content standards express what students should know and should be able to do at various checkpoints during their education. They were developed to adhere to the Common Core State Standards (CCSS) for mathematics and ELA.

### 1.1 Purpose of the Assessment System

The purpose of Maine's Comprehensive Assessment System is to provide point-in-time information about the academic achievement and progress of Maine students. eMPowerME is one portion of this system, and provides information for mathematics and ELA/literacy. Student results are reported according to academic achievement descriptors utilizing cut scores established in standard-setting for each of four achievement levels: Well Below State Expectations, Below State Expectations, At State Expectations, and Above State Expectations. The results from this assessment and others provide educators and the public with information to guide the creation of future educational practices to meet the needs of students, while monitoring the continuous improvement efforts of schools, school administrative units (SAUs), and the state of Maine in achieving a world-class education system for all students.

### 1.2 Organization of This Report

This report includes data and analyses about the operational forms and content for the spring 2018 test administration. It begins with a description of the Maine content standards, which are described in sections 3.2.1 (reading), 3.3.1 (writing and language), and 3.5.1 (mathematics). (See Appendix A for the comprehensive set of content standards.) All operational and field-test items for eMPowerME spring 2018 were subjected to reviews by the Maine Department of Education (Maine DOE). A description of the item development process, along with a description of the alignment process and test development, is presented in complete detail in Chapter 3 -Test Design and Development. A detailed description of the administration processes is found in Chapter 4 - Test Administration, and a discussion of the operational population, as well
as the research samples utilized in the analysis, is found in Section 3.6 - Test Development Process. Chapter 5 describes in detail the processes that were implemented to monitor the quality of the hand-scoring of student responses for short-answer and constructed-response items.

The spring 2018 eMPowerME scores for mathematics and ELA tests were based on a post-equating design. A complete description of the operational and field-test item analyses as well as the calibration/scaling and equating analyses is found in Chapter 6 - Classical Item Analysis and Chapter 7 - Item Response Theory Scaling and Equating. A summary of reliability and validity for different levels of analyses is found in Chapter 8 - Reliability and Chapter 9 - Validity.

## CHAPTER 2 CURRENT YEAR UPDATES

In school year 2017-2018, the MEA was administered for the third time by Measured Progress for mathematics, reading, and writing and language using eMPower Assessments. The forms contained operational items from the previous year's administration and field-test items.

The Maine Essay assessment, developed by Measured Progress specifically for Maine, contains commissioned passages and prompts that had been field-tested in spring 2017. One of these prompts was administered in each grade in spring 2018. The modes of writing and associated learning standards are as follows:

- Grade 3, Informational (W2)
- Grade 4, Informational (W2)
- Grade 5, Opinion (W1)
- Grade 6, Argument (W1)
- Grade 7, Informational (W2)
- Grade 8, Argument (W1)

In 2016-2017, a stand-alone field test of the essay was conducted to identify viable prompts for operational use for the next several years. Following benchmarking and review by Maine DOE, prompts for operational administration in 2017-18 were selected. In 2017-2018, the essay was administered operationally for the first time, within the same test window as mathematics, reading, writing and language.

Beginning this year, the eMPower ME program was enhanced by the addition of Maine-specific itemreview committees. Since eMPower's inception, new items have been reviewed by national item-review committees that have included representation from Maine. In June 2018, new committees comprised solely of Maine educators convened for a three-day meeting in Portland to review the current phase of new item development. This event provided the opportunity for 60 Maine educators to learn more about and become involved in the eMPower item development process. It also provided Measured Progress content developers with the insights of these experienced educators. Feedback collected after the meetings indicated that panelists thought the opportunity was valuable and worthwhile.

## CHAPTER 3 TEST DESIGN AND DEVELOPMENT

### 3.1 Test Specifications

### 3.1.1 Criterion-Referenced Test

Items on the eMPower tests are developed specifically to assess MLRs in mathematics and ELA/literacy (i.e., CCSS adopted in 2011). These standards are the basis for the reporting categories developed for each content area and are used to help guide the development of test items. Although each item is designed to measure a specific standard, an item may address several standards. Also, many mathematics items assess a mathematical practice standard in addition to a conceptual or procedural standard. Essay prompts developed specifically for eMPowerME assess several writing and language standards. For the full complement of content standards, see Appendix A.

### 3.1.2 Item Types

The item types used and the functions of each are described below.
Selected-response items are administered in grades $3-8$ in mathematics, reading, and writing and language to provide breadth of coverage of the standards. Because each selected-response item requires approximately 45 to 90 seconds for most students to answer, these items make efficient use of limited testing time and allow coverage of a wide range of knowledge and skills.

Multi-select selected-response items are administered in grades 3-8 mathematics. They are similar to traditional selected-response items, but ask students to select more than one correct answer. These items allow for further depth of coverage of the standards.

Evidence-based selected-response items are administered in grades 3-8 in reading to assess students' comprehension and analysis of literary and informational text. Students select evidence that supports their understanding or analysis. These items are administered in writing and language to assess students' application of writing skills and language conventions, and require that students select evidence that supports the application of such skills. Each evidence-based selected-response item consists of two parts, and requires a total of approximately $1 \frac{1}{2}$ to $2 \frac{1}{2}$ minutes for most students to answer. The advantages of this item type are: (1) It requires students to read deeply into a text and think critically in order to support text-based ideas, inferences, and conclusions, and (2) It requires students to evaluate the content and context of the text in order to correctly apply the targeted writing skill or language convention.

Constructed-response items typically require students to use higher-order thinking skills, such as summary, evaluation, and analysis, in constructing a satisfactory response. Each constructed-response item
requires approximately 5 minutes for most students to complete. These items are administered in grades 3-8 in mathematics and reading.

An essay prompt is administered in grades 3-8. Students are given 80 minutes for Grades 3, 4 and 5 and 70 minutes for Grades 6,7 and 8 (plus additional time if approved) to respond to an essay prompt by crafting pieces of writing that state an opinion or are informative or argumentative. The essays are scored by independent readers on the quality of the stylistic and rhetorical aspects of the writing, and on the use of standard English conventions.

Approximately $25 \%$ of the selected-response and $25 \%$ of the constructed-response items found on the spring 2018 eMPowerME operational tests will be released to the public in fall 2018. Additionally, all the essay prompts will be released. These items will be posted on a Website hosted by Measured Progress and linked from the Maine DOE Website. Student response data will also be part of the released item documents. Schools are encouraged to incorporate the use of released items in their instructional activities so that students will be familiar with the types of questions found on the eMPowerME tests.

### 3.1.3 Description of Test Design

The spring 2018 eMPowerME tests were structured using both common and matrix items. Common items were taken by all students in a given grade level. Student scores were based only on common items. Matrix items were new items included on the test for field-test purposes. Matrix items were divided among the multiple forms of the test for each grade and content area. The number of test forms varied by content area and ranged from 8-12 forms. Each student took only one form of the test, and therefore encountered a fraction of the matrix items. Matrix items are not distinguishable to students and have a small impact on testing time.

### 3.2 Reading Test Specifications

### 3.2.1 Standards

The test framework for reading at grades $3-8$ is based on a set of CCR reading standards. Items address literary and/or informational texts.

Each reading item is designed to measure either (1) students' comprehension of what they have read or (2) students' ability to analyze and/or interpret what they have read. The items for grades $3-8$ are organized into three main clusters:

- Key Ideas and Details (comprehension or analysis/interpretation): In grades 3-8, students refer to texts solely to demonstrate understanding. At increasing levels of complexity as they advance through the grades, students also: draw inferences from texts; show their ability to comprehend or analyze the central events, central ideas, and/or themes of texts; and analyze and interpret the relationships between aspects of a text (e.g., causes and effects in informational texts, or character traits and the plot of literary text).
- Craft and Structure (comprehension or analysis/interpretation): At increasing levels of complexity through the grades, students demonstrate the ability to comprehend and analyze the meanings of words and phrases in texts (including figurative language in grades $5-8$, as well as analyze the impact of an author's words in grades 6-8); identify and analyze the structure of texts, including how certain portions of text affect meaning; and how point of view and purpose shape the content and style of a text.
- Integration of Knowledge and Ideas (analysis/interpretation): At increasing levels of complexity through the grades, students integrate knowledge and ideas in texts. Specifically, students integrate:
- visual information (e.g., pictures) and textual information;
- evidence provided in informational texts to support ideas and/or claims; and
- important aspects (e.g., main ideas, characters, settings, themes, structures) of paired texts.

### 3.2.2 Item Types

The eMPower reading tests include selected-response, evidence-based selected-response, and constructedresponse items.

Selected-response items require students to demonstrate a wide range of knowledge and skills, and require approximately 1 minute of response time per item. Evidence-based selected-response items are selected-response items with two parts, and require approximately 2 minutes of response time per item. The second part of an evidence-based selected-response item asks students to select evidence that supports the response in the first part. Constructed-response items are more complex, and require approximately 5 minutes of response time per item.

Each type of item is worth a specific number of points in the student's total reading score, as shown in
Tables 3-1 and 3-2.

Table 3-1. 2017-18 eMPowerME: Reading Item Types Grades 3-5

| Item Type | Maximum Number of <br> Points Available |
| :---: | :---: |
| SR | 1 |
| EBSR | 2 |
| CR | 2 or 3 |

SR = selected-response, EBSR = evidencebased selected-response, CR = constructedresponse

Table 3-2. 2017-18 eMPowerME: Reading Item Types Grades 6-8

| Item Type | Maximum Number of <br> Points Available |
| :---: | :---: |
| SR | 1 |
| EBSR | 2 |
| CR | 2 or 4 |

SR = selected-response, EBSR = evidencebased selected-response, CR = constructedresponse

### 3.2.3 Test Design

Table 3-3 summarizes the numbers and types of items that are found on the 2018 eMPowerME reading tests for grades $3-8$. All students received the common items in their forms. Each selected-response item is worth 1 point, and evidence-based selected-response items are worth 2 points. In grades 3-5, constructed-response items are worth either 2 or 3 points. In grades 6-8, constructed-response items are worth either 2 or 4 points.

Table 3-3. 2017-18 eMPowerME: Item Type and Number of ItemsReading Grade 3

| Common |  |  |  |  | Matrix |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SR | EBSR | CR |  | SR | EBSR | CR |  | SR |

Reading Grades 4-8

| Common |  |  | Matrix |  |  | Total per Student |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SR | EBSR | CR | SR | EBSR | CR | SR | EBSR | CR |
| 19 | 3 | 4 | 50 | 10 | 10 | 24 | 4 | 5 |

### 3.2.4 Blueprints

The distribution of emphasis for eMPowerME standards clusters in reading is shown in Table 3-4.

Table 3-4. 2017-18 eMPowerME: Distribution of Emphasis Across Clusters in Terms of Percentage of Total Test Points by Grade-Reading Grades 3-8

| Clusters | Grade Tested |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |
| Key Ideas and Details (reading <br> literature) | 34 | 40 | 26 | 19 | 8 | 19 |
| Craft and Structure (reading <br> literature) | 11 | 6 | 28 | 11 | 8 | 19 |
| Integration of Knowledge and <br> Ideas (reading literature) | 17 | 17 | 9 | 13 | 22 | 0 |
| Key Ideas and Details (reading <br> informational text) | 11 | 17 | 14 | 30 | 22 | 24 |
| Craft and Structure (reading <br> informational text) <br> Integration of Knowledge and <br> Ideas (reading informational text) | 20 | 11 | 14 | 8 | 16 | 19 |

Table 3-5 shows the reporting categories for reading in the eMPower test design and the maximum possible number of raw-score points that students could earn in each reporting category. Note: Because only common items are counted toward students' scaled scores, only common items are reflected in this table.

Table 3-5. 2017-18 eMPowerME: Distribution of Raw Score Points Across Reporting Categories by Grade-Reading Grades 3-8

| Reporting Categories by Grade—Reading Grades 3-8 |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Reporting Category | 3 | 4 | 5 | 6 | 7 | 8 |
| Comprehension of Literary Text | 9 | 8 | 8 | 3 | 3 | 5 |
| Analysis \& Interpretation of Literary Text | 13 | 14 | 14 | 13 | 11 | 9 |
| Comprehension of Informational Text | 4 | 6 | 4 | 9 | 11 | 11 |
| Analysis \& Interpretation of Informational Text | 9 | 7 | 9 | 12 | 12 | 12 |

### 3.2.5 Depth of Knowledge

Each item on the eMPowerME test in reading is assigned a Depth of Knowledge (DOK) level according to the cognitive demand of the item. DOK is not synonymous with difficulty. The DOK level rates the complexity of the mental processing a student must use to respond to an item. Each of the three levels is described in Table 3-6.

Table 3-6. 2017-18 eMPowerME: Depth of Knowledge-

## Reading

| Level 1 <br> (Recall) | This level includes reading that does not involve analysis of text, and instead is comprised of <br> basic comprehension. Items require only a shallow understanding of text presented and <br> often consist of verbatim recall from text or simple understanding of a single word or phrase. |
| :---: | :--- |
| Level 2 | This level includes the engagement of mental processing beyond recalling or reproducing a <br> response; it requires both comprehension and subsequent processing of text or portions of <br> text. Inter-sentence analysis and inference are required. |
| (Skill/Concept, they are still required to show |  |
| Level 3 | This level requires students to go beyond the text; however, the <br> understanding of the ideas in the text. Students may be encouraged to explain, generalize, <br> or conect ideas. Standards and items involve reasoning and a deep level of analysis. Items <br> may involve analyzing how an author achieves his/her purpose, inference across an entire <br> passage, or connections between texts. |

Table 3-7 lists the target percentages of score points assigned to each DOK level in reading.

Table 3-7. 2017-18 eMPowerME: Depth of Knowledge in Terms of Target Percentage of Test
by Grade—Reading Grades 3-8

| DOK | Grade |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |  |
| Level 1 | $0-20$ | $0-20$ | $0-20$ | $0-20$ | $0-20$ | $0-20$ |  |
| Level 2 | $50-70$ | $50-70$ | $50-70$ | $50-70$ | $50-70$ | $50-70$ |  |
| Level 3 | $20-40$ | $20-40$ | $20-40$ | $20-40$ | $20-40$ | $20-40$ |  |
| TOTAL | 100 | 100 | 100 | 100 | 100 | 100 |  |

### 3.2.6 Passage Types

The reading passages for eMPowerME are selected from the following categories:

- Literary passages, representing a variety of forms including drama, poetry, excerpts from novels, short stories, and traditional narratives such as fables and folktales.
- Informational passages, often about science- and social studies-related topics. These passages are often from newspapers, magazines, and book excerpts. The passages are authentic texts selected from grade-level-appropriate reading sources that students would be likely to encounter in the classroom and when reading independently.

All passages are collected from published works.

### 3.3 Writing and Language Test Specifications

### 3.3.1 Standards

The test framework for writing and language at grades $3-8$ is based on a set of CCR writing and language standards. Items address argument, informative/explanatory, and/or narrative texts.

Each writing and language item is designed to measure students' ability to evaluate the content and context of text in order to correctly apply the targeted writing skill or language convention. The items for grades 3-8 are organized into two main categories. Each category contains a unique set of clusters:

## Writing

- Text Types and Purposes: In grades 3-8, students interact with a variety of texts to demonstrate increasing sophistication with demanding content and sources. At increasing levels of complexity across the grades, students write informative/explanatory texts to examine a topic and convey ideas and information clearly, or write argumentative or opinion pieces on topics or texts, supporting a point of view with reasons and information.

## Language

- Conventions of Standard English: In grades 3-8, students demonstrate command of the conventions of standard English grammar and usage. At increasing levels of complexity across the grades, students move from simple identification of conventions (e.g., identifying uppercase and lowercase letters or applying the rules of capitalization) to more complex applications of conventions (e.g., recognizing and correcting inappropriate shifts in pronoun number or recognizing and correcting misplaced and dangling modifiers).
- Knowledge of Language: In grades 3-8, students apply knowledge of language and conventions to convey ideas or to create a specific effect. At increasing levels of complexity across the grades, students move from conveying ideas or creating a desired effect to focusing on developing and maintaining style and tone by choosing language that expresses ideas precisely and concisely.
- Vocabulary Acquisition and Use: In grades 3-8, students apply knowledge of vocabulary structure (e.g., affixes and roots) to understanding the meaning of grade-level vocabulary. At
increasing levels of complexity across the grades, students use the context of passage text to determine the concrete and inferred meaning of vocabulary. Additionally, students move from using basic reference materials (e.g., glossary and dictionary) to using more complex references (e.g., thesaurus).

### 3.3.2 Item Types

The eMPower writing and language tests include selected-response and evidence-based selectedresponse items. Grades 3-8 eMPower writing and language tests use an embedded error format, in which deliberate errors are identified or introduced into passage text. Items developed address the specific errors identified or introduced into the passage text.

Selected-response items require students to demonstrate a wide range of knowledge and skills, and require approximately 45 seconds of response time per item. Evidence-based selected-response items are selected-response items with two parts requiring approximately $1 \frac{1}{2}$ minutes of response time per item. The second part of an evidence-based selected-response item asks students to select evidence that supports the response in the first part.

Each type of item is worth a specific number of points in the student's total writing and language score, as shown in Table 3-8.

Table 3-8. 2017-18 eMPowerME: Writing and Language: Writing Item Types

| Item Type | Maximum Number of Points Available |
| :---: | :---: |
| SR | 1 |
| EBSR | 2 |

### 3.3.3 Test Design

Table 3-9 summarizes the numbers and types of items that are found on the 2017-18 eMPower writing and language tests for grades 3-8. All students received the common items in their forms. Each selected-response item is worth 1 point, and evidence-based selected-responses are worth 2 points.

Table 3-9. 2017-18 eMPowerME: Item Type and Number of ItemsWriting and Language Grades 3-8

| Common |  |  | Matrix |  | Total per student |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SR | EBSR |  | SR | EBSR |  | SR |
| 20 | 3 |  | 240 | 40 | EBSR |  |  |

### 3.3.4 Blueprints

## Writing and Language

The distribution of emphasis for eMPower standards clusters in writing and language is shown in Table 3-10.

Table 3-10. 2017-18 eMPowerME: Distribution of Emphasis Across Reporting Clusters in Terms of Percentage of Total Test Points by Grade—Writing and Language Grades 3-8

| Clusters | Grade Tested |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |
| Revising Narrative Text (RN) | 36 | 36 | 28 |  |  |  |
| Revising Expository/Informational Text (RE) | 28 | 28 | 36 | 36 | 28 | 28 |
| Revising Argument Text (RA) |  |  |  | 28 | 36 | 36 |
| English Language and Conventions (EC) | 36 | 36 | 36 | 36 | 36 | 36 |

Table 3-11 shows the reporting categories for writing and language in the eMPower test design and the maximum possible number of raw-score points that students could earn in each reporting category. Note: Because only common items are counted toward students' scaled scores, only common items are reflected in this table.

Table 3-11. 2017-18 eMPowerME: Reporting Categories and Targeted Possible Raw Score Points by Grade-Writing and Language Grades 3-8

| Reporting Category | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Revising Narrative Text | 10 | 10 | 8 |  |  |
|  | 8 | 8 | 10 | 10 | 8 | 8 |
|  |  |  | 8 | 11 | 10 |  |
|  | 8 | 8 | 8 | 8 | 7 | 8 |
|  | 26 | 26 | 26 | 26 | 26 | 26 |

### 3.4 Essay Prompts

In 2018, operational essay prompts were again administered as part of the spring assessment (see Chapter 2: Current Year Updates). The essay prompts address informative/explanatory or argument/opinion commissioned pairs of texts. In addition, structures of language and writing conventions are assessed through the prompts. Essay passages and prompts are developed with the following criteria as guidelines:

- The passages and prompts should be interesting to students.
- The passages and prompts must be accessible to all students (i.e., all students would have something to write about the topic).
- The prompts must generate sufficient text to be effectively scored.

The development of an essay requires students to explain and analyze information to compose focused, organized, coherent, and purposeful prose supported by evidence from multiple sources. Essay prompts are therefore developed to be classified as Depth of Knowledge Level 3. The category reporting structure for grades 3-8 essays is shown in Table 3-12. The table provides the maximum possible number of raw-score points that students could earn.

Table 3-12. 2017-18 eMPowerME: Reporting Subcategory and Possible Maximum Raw Score Points Possible by Grade—Essay Grades 3-8

| Sub-category | Grade Tested |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |

| Organization | 4 | 4 | 4 | 4 | 4 | 4 |
| Language Use \& Vocabulary | 4 | 4 | 4 | 4 | 4 | 4 |
| Command of Conventions | 4 | 4 | 4 | 4 | 4 | 4 |
| Total | 16 | 16 | 16 | 16 | 16 | 16 |

### 3.4.1 Depth of Knowledge

Each item on the eMPower test in writing and language is assigned a DOK level according to the cognitive demand of the item. DOK is not synonymous with difficulty. The DOK level rates the complexity of the mental processing a student must use to respond to an item. Each of the three levels is described in Tables 3-13 and 3-14, for writing and language, respectively.

Table 3-13. 2017-18 eMPowerME: Depth of KnowledgeWriting Skills
Level 1 This level requires the student to write or recite simple facts. This writing or recitation measures the student's ability to communicate basic ideas, and does not include complex synthesis or analysis. This level requires some mental processing. Students are beginning to connect ideas using a
Level 2 simple organizational structure. For example, students may be engaged in note-taking, outlining, or writing simple summaries.
This level requires some higher-level mental processing. Students are engaged in developing compositions that include multiple paragraphs. These compositions may include complex sentence structure and may demonstrate some synthesis and analysis. Students show awareness of their
Level 3 audience and purpose through focus, organization, and the use of appropriate compositional elements. The use of appropriate compositional elements includes skills such as addressing chronological order in a narrative, or including supporting facts and details in an informational report.

Table 3-14. 2017-18 eMPowerME: Depth of Knowledge—
Language Conventions
This level requires the student to use simple spelling or vocabulary and/or write simple sentences.
Level 1 The student applies basic language conventions correctly, including applying appropriate grammar, punctuation, and capitalization.
This level requires the student to construct and edit simple and compound sentence structures. The
Level 2 student applies more complex language conventions correctly, including applying appropriate grammar, punctuation, and capitalization.
This level requires the student to construct and edit a variety of complex sentence structures. The
Level 3 student applies more complex language conventions correctly, including applying appropriate grammar, punctuation, and capitalization.

Table 3-15 lists the target percentages of score points assigned to each DOK level in writing and language.

Table 3-15. 2017-18 eMPowerME: Depth of Knowledge in Terms of Target Percentage of Total Test Points by Grade-Writing \& Language Grades 3-8

| DOK | Grade |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |  |
| Level 1 | $15-35$ | $15-35$ | $15-35$ | $15-35$ | $15-35$ | $15-35$ |  |
| Level 2 | $40-60$ | $40-60$ | $40-60$ | $40-60$ | $40-60$ | $40-60$ |  |
| Level 3 | $15-35$ | $15-35$ | $15-35$ | $15-35$ | $15-35$ | $15-35$ |  |
| TOTAL | 100 | 100 | 100 | 100 | 100 | 100 |  |

### 3.4.2 Passage Types

## Writing and Language

The writing and language passages for eMPower are selected from the following categories:

- Narrative passages, representing a variety of forms including drama, excerpts from novels, short stories, and traditional narratives such as fables and folktales. Narrative passages succinctly and lucidly describe a fictional event and feature many or all the hallmarks of the narrative form-plot/conflict, climax/epiphany, conclusion, dialogue, characters' thoughts, action, and description.
- Informational/Explanatory passages, representing one of three subject areas: social studies/history; science/social science/technical subjects; and, to a lesser extent, the humanities. Although written with the general reader in mind, passages strive to present compelling information that responds to relevant issues in each field-a new interpretation of an event or phenomenon; an examination of an overlooked (or misunderstood) movement, moment, or figure; an introduction to foundational knowledge in any of the three disciplines, etc.
- Argument passages, representing cogent argumentation. Argument passages tend to be informed by issues in the social sciences or current events. Argument passages establish a position; provide claims, supported by evidence, that develop that position; introduce and rebut a counterclaim (in grades 7 and 8 ); and, throughout, use rhetorical techniques
(persuasive transitions, rhetorical questions, appeals to reason or personal experience, etc.) to advance the position.

All embedded-error passages are commissioned texts, which are passages developed specifically for the purpose of the assessment.

## Essay Prompts

The passages and prompts used for the operational essays were assigned to the following categories:

- Grade 3, Informational
- Grade 4, Informational
- Grade 5, Opinion
- Grade 6, Argument
- Grade 7, Informational
- Grade 8, Argument

In 2018, all passages were commissioned texts composed specifically for the associated writing prompts and grade levels.

### 3.5 Mathematics Test Specifications

### 3.5.1 Standards

The test framework for mathematics at grades 3-8 is based on a set of CCR mathematics standards, and each item on the grades $3-8$ eMPower tests is designed to measure a specific mathematics concepts and procedures content standard or standards, and most items also measure a mathematical practices process standard.

The mathematics items at grades 3-5 are organized into three concepts and procedures reporting categories:

- Operations and Algebraic Thinking: Students represent and solve problems, understand and apply the properties of operations, and generate and analyze patterns and relationships.
- Numbers and Operations in Base Ten and Fractions: Students understand and demonstrate a sense of what whole numbers, fractions, and decimal numbers mean and how they are used. Students understand and demonstrate computation skills.
- Measurement and Data and Geometry: Students understand and demonstrate measurement skills, including geometric measurement, by accurately measuring and estimating, solving problems, and converting between units within a measurement system. Students represent and interpret data using picture graphs, bar graphs, and line plots. Students reason with shapes and their attributes, classify shapes based on their properties, and graph points on the coordinate plane to solve problems.

The mathematics items at grades 6 and 7 are organized into five concepts and procedures reporting categories:

- Ratios and Proportional Relationships: Students understand ratio concepts and proportional relationships and use them to solve real-world problems.
- The Number System: Students extend their previous number sense and computation of whole numbers, fractions, and decimal numbers to the entire system of rational numbers.
- Expressions and Equations: Students write and evaluate expressions, apply the properties of operations to generate equivalent expressions, and solve problems using algebraic expressions, equations, and inequalities.
- Geometry: Students solve problems involving area, surface area, volume, and angle measures. Students draw, construct, and describe geometric figures and describe the relationships between figures.
- Statistics and Probability: Students understand statistical variability, summarize and describe distributions, use random sampling to draw inferences about a population or comparative inferences between populations. Students develop an understanding of probability and use and evaluate probability models.

The mathematics items at grade 8 are organized into five concepts and procedures reporting categories:

- Functions: Students define, evaluate, and compare functions and use functions to model relationships between quantities.
- The Number System: Students extend their previous number sense to include the system of irrational numbers. Students work with radicals and integer exponents.
- Expressions and Equations: Students understand the connections between proportional relationships, lines, and linear equations, and analyze and solve linear equations and pairs of simultaneous linear equations.
- Geometry: Students understand congruence and similarity, understand and apply the Pythagorean Theorem, and solve problems involving volume of three-dimensional figures.
- Statistics and Probability: Students investigate the patterns of association in bivariate data.

Additionally, the mathematics items at each of the grades $3-8$ have the processes and proficiencies associated with mathematical practices process strands of problem-solving, reasoning and argument, modeling, and patterns and structure embedded into them. Specifically, these are:

- Problem Solving and Modeling: Students apply grade-level appropriate mathematical concepts and procedures to solve standard and nonstandard real-world and mathematical problems. Students use grade-appropriate quantitative reasoning to interpret mathematical representations, represent real-world mathematical situations using mathematical models, and use mathematical models to solve real-world and mathematical problems.
- Reasoning, Patterns, and Structure: Students critique the mathematical reasoning of others. Students look for and make use of repeated reasoning in mathematics. Students look for and make use of mathematical structure.

### 3.5.2 Item Types

The eMPower mathematics tests include selected-response, multi-select selected-response, and constructed-response items. There are two varieties of constructed-response items. The 2-point constructedresponse items require students to perform a computation, write an expression, equation, or inequality, and/or solve a simple problem, and may include having the student provide written evidence of the understanding of the standard(s) being assessed. They require approximately 3 minutes of response time per item. These items are also scored as a 1-point mathematical process constructed-response item using a separate, distinctive rubric. The 4-point constructed-response items are more complex and require students to provide written evidence of the understanding of the standard(s) being assessed, and require approximately 7 minutes of response time per item. These items are also scored as a 2-point mathematical process constructed-response item using a separate, distinctive rubric. Selected-response items and multi-select selected-response items each require approximately $11 / 2$ minutes of response time. Each type of item is worth a specific number of points in the student's total mathematics score, as shown in Table 3-16.

Table 3-16. 2017-18 eMPowerME: Mathematics Item Types

| Item Type | Maximum Number of Points Available |
| :---: | :---: |
| SR/MS | 1 |
| CR | 2 or 4 |

SR = selected-response; MS = multi-select selected-response; CR = constructed-response

### 3.5.3 Test Design

Table 3-17 summarizes the numbers and types of items that are found on the 2018 eMPower mathematics tests for each of the grades 3-8, respectively. All students receive the common items in their forms. The selected-response items and multi-select selected-response items are each worth 1 point, and each constructed-response item is worth either 2 or 4 points. Score points within a grade level are divided so that selected-response items and multi-select selected-response items represent approximately $75 \%$ of the possible score points, and constructed-response items together represent approximately $25 \%$ of the possible score points.

Table 3-17. 2017-18 eMPowerME: Item Type and Number of Items-
Mathematics

| Grade | Common |  | Matrix |  | Total per Student |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SR/MS | CR | SR/MS | $C R$ | SR/MS | CR |
| 3 | 33 | 4 | 50 | 5 | 38 | 5 |
| 4 | 32 | 4 | 50 | 5 | 37 | 5 |
| 5 | 33 | 4 | 50 | 5 | 38 | 5 |
| 6 | 36 | 4 | 50 | 5 | 41 | 5 |
| 7 | 36 | 4 | 50 | 5 | 41 | 5 |
| 8 | 37 | 4 | 50 | 5 | 42 | 5 |

### 3.5.4 Blueprints

The distribution of emphasis for eMPower content strands for mathematics is shown in Table 3-18.
Table 3-18. 2017-18 eMPowerME: Distribution of Emphasis for Content Strands in Terms of Percentage of Test Points by Grade-Mathematics Grades 3-8

| Content Strand |  | Grade Tested |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |  |
| Operations and Algebraic Thinking | 31 | 27 | 22 |  |  |  |  |
| Numbers \& Operations in Base Ten and Numbers and | 31 | 46 | 31 |  |  |  |  |
| Operations-Fractions | 38 | 27 | 47 |  |  |  |  |
| Measurement and Data and Geometry |  |  |  | 17 | 17 |  |  |
| Ratios \& Proportional Relationships |  |  |  |  |  | 20 |  |
| Functions |  |  |  | 25 | 12 | 8 |  |
| The Number System |  |  |  | 25 | 21 | 27 |  |
| Expressions and Equations |  |  |  | 17 | 17 | 25 |  |
| Geometry | 100 | 100 | 100 | 100 | 100 | 100 |  |
| Statistics and Probability |  |  |  |  |  | 100 |  |
| TOTAL* |  |  |  |  |  |  |  |

*Totals may not equal 100 due to rounding.

Table 3-19 shows the concepts and procedures reporting categories for mathematics in the eMPower test design and the maximum possible number of raw-score points that students can earn. The goal for distribution of score points or balance of representation across the reporting categories varies from grade to grade. Note: Only common items are reflected in this table, as only they are counted toward students' scaled scores.

Table 3-19. 2017-18 eMPowerME: Concepts and Procedures Reporting Categories and Possible Raw Score Points by Grade-Mathematics Grades 3-8

| Reporting Category |  | Grade Tested |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |
| Operations and Algebraic Thinking | 14 | 12 | 10 |  |  |  |
| Numbers \& Operations in Base Ten Fractions | 14 | 20 | 14 |  |  |  |
| Measurement and Data and Geometry | 17 | 12 | 21 | 8 | 8 |  |
| Ratios \& Proportional Relationships |  |  |  | 8 |  | 10 |
| Functions |  |  | 12 | 6 | 4 |  |
| Number System |  |  | 12 | 10 | 13 |  |
| Expressions and Equations |  | 8 | 8 | 12 |  |  |
| Geometry |  |  | 8 | 16 | 10 |  |
| Statistics and Probability |  |  |  | 8 |  |  |

Table 3-20 shows mathematical processes reporting categories for mathematics and the maximum possible number of raw-score points that students can earn. Note: Only common items are reflected in this table, as only they are counted toward students' scaled scores, and not every item in each grade assessed a process strand.

Table 3-20. 2017-18 eMPowerME: Mathematical Processes Reporting Categories and Possible Raw Score Points by Grade-Mathematics Grades 3-8

| Reporting Category | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Problem Solving \& Modeling <br>  <br> Structure | 15 | 14 | 15 | 18 | 20 | 22 |

### 3.5.5 Depth of Knowledge

Each item on the eMPower test in mathematics is assigned a DOK level according to the cognitive demand of the item. DOK is not synonymous with difficulty. The DOK level rates the complexity of the mental processing a student must use to solve a problem. Each of the three levels is described in Table 3-21.

Table 3-21. 2017-18 eMPowerME: Depth of Knowledge—Mathematics

| Level 1 <br> (Recall) | This level is defined by the rote recall of information, or performance of a simple, routine <br> procedure. It includes repeating a memorized fact, definition, or term, performing a simple <br> algorithm, rounding a number, or applying a formula. |
| :--- | :--- |
|  | This level is defined by engaging in some mental processing beyond a habitual response, as <br> well as decision-making about how to approach the problem or activity. This level can <br> require conceptual understanding and/or demonstrating conceptual knowledge by explaining <br> Level 2 <br> thinking in terms of concepts. It includes distinguishing among mathematical ideas, |

Level 3

This level is defined by reasoning and analyzing using mathematical principles, ideas, structure, and practices. It includes solving involved problems; conjecturing; creating novel solutions and forms of representation; devising original proofs, mathematical arguments, and critiques of arguments; constructing mathematical models; and forming robust inferences and predictions.

Table 3-22 lists the target percentages of total score points assigned to each level of DOK in mathematics.

Table 3-22. 2017-18 eMPowerME: Depth of Knowledge in Terms of Target Percentage of Test by Grade-Mathematics Grades 3-8

| DOK | Grade |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 4 | 5 | 6 | 7 | 8 |  |
| Level 1 | $5-25$ | $5-25$ | $5-25$ | $5-25$ | $0-20$ | $0-30$ |  |
| Level 2 | $50-80$ | $50-80$ | $50-80$ | $50-80$ | $50-80$ | $50-80$ |  |
| Level 3 | $5-30$ | $5-30$ | $5-30$ | $5-30$ | $5-30$ | $5-30$ |  |
| TOTAL | 100 | 100 | 100 | 100 | 100 | 100 |  |

### 3.5.6 Use of Calculators and Reference Sheets

While the eMPower team of specialists who designed the mathematics test acknowledge the importance of mastering arithmetic algorithms, they understand that the use of calculators is a necessary and important skill. Calculators can save time and prevent error in the measurement of some higher-order thinking skills, allowing students to work on more sophisticated and intricate problems. For these reasons, it was decided that at grades 3-8 calculators should be prohibited in the first of the two sessions of the eMPower mathematics tests and permitted in the second session.

Reference sheets are not provided to students at grades 3-8. To properly assess the set of CCR standards, some items are written so that students will need to know the formulas to answer the question, whereas other items are written so that knowledge of the formula is not being assessed, so the formulas may be provided within the item.

### 3.6 Test Development Process

### 3.6.1 Item Development

Items used on eMPowerME tests are developed to assess CCR standards and, as such, are closely aligned with Maine content standards. Measured Progress test developers ensure this alignment, and ongoing independent evaluations are held to verify alignment. In addition, independent reviews are scheduled to ensure that items and passages conform to bias and sensitivity guidelines.

### 3.6.2 Item Reviews at Measured Progress

The test developers at Measured Progress review newly developed items for:

- alignment to the intended content standard;
- item integrity, including content and structure, format, clarity, and possible ambiguity;
- desired correct responses;
- appropriateness and quality of graphics;
- appropriateness of scoring guide descriptions and distinctions;
- completeness of associated item documentation (e.g., scoring guide, content codes, key, grade level, DOK); and
- appropriateness for the designated grade level.

### 3.6.3 Independent Item Reviews

Newly developed eMPower items regularly undergo review by nationally representative panels of content and assessment experts. Maine educators are included in these panels. Additional Maine-only panels were convened in June 2018 to review newly developed items, and 60 Maine panelists participated in these reviews.

The purpose of these reviews is to evaluate items and determine their suitability for assessment by answering the following four questions:

- Does the item align with the assigned content standard(s)?
- Is the content accurate?
- Are the content and context grade-level appropriate?
- Does the item provide maximum accessibility for all students?

### 3.6.4 Bias and Sensitivity Review

Bias and sensitivity review is an essential component of the development process. During the eMPower bias and sensitivity review process, items are reviewed by a diverse, nationally representative committee of people who represent a variety of student subgroups. Items are examined for content and context that might cause the test to be inaccessible for these subgroups of students, or that might generally offend or dismay students, teachers, parents, or community members. Awareness of these considerations in the development of assessment items and materials helps to avoid controversial issues, and concerns can be resolved before the test forms are produced.

Additionally, all Measured Progress test developers receive training in bias and sensitivity issues. Controversial and biased topics are avoided in the test development process. Internal reviews include review of not only content but context, with an awareness of bias and sensitivity issues. Since no one person is wellversed in the full spectrum of possible concerns, the bias and sensitivity review committee helps to ensure that
all potential issues are identified. All passages and items underwent bias and sensitivity prior to field-testing, except for the passages and prompts from the essay pilot, which underwent bias and sensitivity review after the pilot administration.

### 3.6.5 Reviewing and Refining

Recommendations from committee reviews and from Measured Progress's own internal reviews help to refine eMPower items and passages being developed. Measured Progress test developers carefully evaluate these recommendations and apply edits as appropriate.

### 3.6.6 Item Editing

Measured Progress editors review and edit eMPower items and commissioned passages to ensure adherence to sound testing principles and to style guidelines in the Chicago Manual of Style, 16th edition. These principles include the stipulations that items and commissioned passages:

- demonstrate correct grammar, punctuation, usage, and spelling;
- are written in a clear, concise style;
- contain unambiguous explanations that tell students what is required to attain a maximum score;
- are written at a reading level that allows students to demonstrate their knowledge of the subject matter being tested regardless of reading ability;
- exhibit high technical quality regarding psychometric characteristics;
- have appropriate answer options or score point descriptors; and
- are free of potentially insensitive content.

### 3.6.7 Field Testing, Item Selection, and Operational Test Assembly

All eMPower items are appropriately field-tested prior to operational use. eMPower ME assessments employ a matrix design that embeds field test items within each form.

Measured Progress test developers carefully select the items that will appear in the eMPower operational tests. In consultation with Measured Progress psychometricians, test developers consider the following in selecting sets of items for the operational test:

- Content coverage/match to test design and blueprints. The test designs and blueprints stipulate a specific number of items by item type.
- Item difficulty and complexity. Item statistics are evaluated to ensure quality psychometric characteristics, as well as similar levels of difficulty and complexity from year to year.
- "Cueing" items. Items are reviewed for any information that might "cue" or provide information that would help to answer another item.

Test developers sort and lay out passages and items into test forms. During assembly of the test forms, the following criteria are considered:

- Key patterns. The sequence of keys (correct answers) is reviewed to ensure that their order appears random.
- Option balance. Selected-response items are balanced across forms so that key options are not markedly disproportionate.
- Page fit. For paper forms, item placement is analyzed to ensure the best fit and arrangement of items on any given page. For computer-based test (CBT) forms, items always appear one per screen. ELA passages and, when applicable, common mathematics stimuli always appear to the left of the associated item.
- Visual appeal. For paper forms, the visual accessibility of each page is always taken into consideration, including aspects such as the amount of "white space," the density of the test, and the number of graphics. For CBT forms, every effort is made to make each item as accessible as possible. However, each item's presentation may differ a bit depending on the delivery method and size of the screen.

### 3.6.8 Operational Test Draft Review

Paper forms are laid out as they would appear in the final test booklets, and the forms are again thoroughly reviewed by Measured Progress editors to ensure that items and passages appear exactly as intended. Any changes made during test construction are reviewed and approved by the test developer. For CBT forms, editors also ensure that the items, graphics, and passages are in the order intended and are rendering correctly. Any content or sequence changes made to the items during paper forms production are also made during CBT production, and vice versa.

### 3.6.9 Alternative Presentations

The Form 1 test for each grade was translated into Braille by National Braille Press, a subcontractor that specializes in test materials for blind and visually impaired students. In addition, Form 1 for each grade was adapted into a large-print version.

## CHAPTER 4 TEST ADMINISTRATION

### 4.1 Responsibility for Administration

As indicated in the School Test Coordinator Manual, District Assessment Coordinators and/or their designated School Test Coordinators (STCs) were responsible for the proper administration of the eMPowerME assessments. Manuals were used to ensure the uniformity of administration procedures from school to school. These manuals-the School Test Coordinator Manual and the Test Administration Manual-stress the importance of test security and ethical administration while the tests are in the schools, and contain explicit directions and scripts for test administrators to read aloud to test-takers. These documents may be accessed on the eMPower Maine Help and Support Website at: https://maine.onlinehelp.measuredprogress.org/testing-materials/

### 4.2 Administration Procedures

In addition to distributing the School Test Coordinator Manual and the Test Administration Manual, the Maine DOE, along with Measured Progress, provided statewide training workshops and statewide test administration Webinars to train and inform school personnel about the eMPowerME testing procedures. Trainings were posted on the eMPower Maine Help and Support Website at: https://maine.onlinehelp.measuredprogress.org/training/

### 4.3 Participation Requirements and Documentation

The intent is for all students in grades $3-8$ to participate in eMPowerME assessments and for all thirdyear high school students to participate in the SAT through standard administration and/or administration with accommodations. Any student who is absent during any session of the eMPowerME, SAT or alternate assessment is expected to take a make-up test within the testing window.

On those occasions where it was deemed necessary to exclude a student from sections of the assessment or from the assessment as a whole because of special considerations (e.g., hospitalization or a death in the family), schools were asked to seek the approval of the Maine DOE's Special Considerations Review Team. The names of the excluded students were forwarded to Measured Progress so these students would not be included in any reports, or as part of the denominator representing the total number of students. Appendix C presents student participation in eMPowerME for all students by demographic group.

### 4.3.1 Students With Disabilities

All students were expected to participate in the eMPowerME assessments or the SAT, unless they completed the alternate assessment during the 2017-18 school year.

Large-print versions of the tests for all grades were created using Form 1 of the tests enlarged to 16point font for students with visual impairments. At all grades, Form 1 of the tests was translated into Braille.

### 4.4 Documentation of Supports and Accommodations

The approved supports/accommodations for eligible students were listed in the MEA Accessibility Guide and on page 2 of the student answer booklet. This information was coded in by the appropriate staff before testing was completed. The MEA Portal User Guide and the School Test Coordinator Manual provided directions for coding the information related to supports/accommodations.

All students who were considered for supports/accommodations on the MEA should have had their individual situations reviewed by a team within the school prior to the time of testing. For every student with an identified exceptionality requiring an Individualized Education Program (IEP), schools were required to hold an IEP team meeting that addressed that student's needs for accommodations. For other students needing test supports/accommodations who did not have an identified disability, a meeting was required that included one of the student's teachers, the building principal, related-services personnel, and, whenever possible, the student's parents/guardians. If it was not possible for the parents/guardians to attend the meeting, they were notified of the committee's recommendations for supports/accommodations prior to the time of testing.

Recommended supports/accommodations were to be consistent with those supports/accommodations already being used in the student's instructional program. Any such supports/accommodations were reflected either in the minutes of the IEP team meeting (for students requiring an IEP), or in a statement prepared for the cumulative folders of students not requiring IEPs. Schools were given the following statement as a "model": The student will participate in the [__]th grade Maine Educational Assessment as scheduled during March-April 2018 with the following supports/accommodations.

Table 4-1. 2017-18 eMPowerME: Numbers of Students Tested With and Without Supports and Accommodations by Subject and Grade

| Subject | Grade | Number of Students Tested <br> Without |  |
| :---: | :---: | :---: | :---: |
| Mathematics | With <br> Accommodations | Accommodations |  |
|  | 3 | 10,054 | 2,876 |
|  | 4 | 9,669 | 3,299 |
|  | 5 | 10,138 | 3,175 |
|  | 6 | 10,252 | 2,800 |
|  | 7 | 10,733 | 2,590 |
| ELA | 3 | 10,692 | 2,514 |
|  | 4 | 10,036 | 2,859 |
|  | 5 | 9,650 | 3,282 |
|  | 6 | 10,124 | 3,157 |
|  | 7 | 10,241 | 2,789 |
|  | 8 | 10,710 | 2,579 |

Table 4-1 and Appendix D show the supports and accommodation frequencies observed for the 2018 eMPowerME administration. The MEA Accessibility Guide, which includes detailed descriptions of approved supports and accommodations and their proper application, is presented in Appendix E.

### 4.5 Test Security

Maintaining test security is critical to the success of eMPowerME. The School Test Coordinator Manual and the Test Administration Manual explain in detail all test security measures and test administration procedures. A training Webinar on test security was also posted on the eMPower Maine Help and Support Website at: https://maine.onlinehelp.measuredprogress.org/training/. School personnel were informed that any concerns about breaches in test security were to be reported to the STC and/or principal immediately. The STC and/or principal were responsible for immediately reporting the concern to the District Assessment Coordinator and the Maine DOE Assessment Coordinator. Test security was also strongly emphasized at the test administration workshops. Principals or STCs were required to $\log$ on to a Website to complete the School Test Coordinator Test Security \& Data Privacy Agreement or the Test Administrator/Proctor Test Security \& Data Privacy Agreement (as applicable). Schools that administer paper-pencil tests also had to provide the number of secure tests received from Measured Progress, the number of tests administered to students, and the number of secure test materials that they were returning to Measured Progress. By signing and submitting the agreement, STCs, test administrators (TAs), or proctors certified that the tests were administered according to the test administration procedures outlined in the School Test Coordinator Manual and the Test Administration Manual; that the security of the tests was maintained; that no secure material was duplicated or in any way retained in the school; and that all test materials had been accounted for and returned to Measured Progress.

### 4.6 Test and Administration Irregularities

Test sessions invalidated by client request due to testing irregularities in the 2018 administration totaled 44 , including 44 students total. The following table breaks down the reasons for invalidating a test session:

Table 4-2. 2017-18 eMPowerME: Test Invalidations by Reason

| Invalidation Reason | Number of Students | Number of Sessions |
| :---: | :---: | :---: |
| Student Cheating | 4 students | 4 sessions |
| TA/Proctor Error | 24 students | 24 sessions |
| Wrong Grade | 17 students | 119 sessions |
| Wrong Student/SSID/Grade | 22 students | 53 sessions |
| TOTAL | $\mathbf{6 7}$ students | $\mathbf{2 0 0}$ sessions |

### 4.7 Test Administration Window

The operational test administration window was March 19-April 13, 2018.

### 4.8 Service Center

To provide additional support to schools before, during, and after testing, Measured Progress established the Maine Service Center. The support of this service center is essential to the successful administration of any statewide test program. This service center provides a centralized location that individuals in the field can call using a toll-free number or e-mail to ask specific questions or report any problems they may be experiencing. Representatives are responsible for receiving, responding to and tracking calls and e-mails, and then routing issues to the appropriate person(s) for resolution. All calls and e-mails are logged into a database that includes notes regarding the issue and resolution of each call.

The Maine Service Center was open to receive calls from 6:30 a.m. to 6:00 p.m., Monday-Friday, beginning one week before the start of testing and ending one week after the conclusion of testing. The Maine Service Center was open to receive calls from 7:30 a.m. to 4:30 p.m., Monday-Friday, outside the testing window.

## CHAPTER 5 SCORING

### 5.1 Machine-Scored Items

Selected-response item responses were compared to scoring keys using item analysis software. Correct answers were assigned a score of 1 point and incorrect answers were assigned 0 points. Student responses with multiple marks and blank responses were also assigned 0 points.

The hardware elements of the scanners monitor themselves continuously for correct read, and the software that drives these scanners also monitors correct data reads. Standard checks include recognition of a sheet that does not belong or is upside down or backward, identification of critical data that are missing (e.g., a student ID number), test forms that are out of range or missing, and page or document sequence errors. When a problem is detected, the scanner stops and displays an error message directing the operator to investigate and correct the situation.

### 5.2 Person-Scored Items

The images of student responses to constructed-response items were hand-scored through the iScore system. The majority of students submitted their tests online, using a computer-based testing system. A small portion of students took a paper-based test, which was scanned to create a digital image. Regardless of the method of test administration, all scoring was done through the iScore system. Student confidentiality was easily maintained since all Maine scoring was conducted through a scoring engine that did not provide scorers with access to student, school, or school district information. The iScore system identified responses and students through unique booklet identifiers that were connected back to the proper student during data analysis and reporting.

Through iScore, qualified scorers at computers accessed digital images of student responses. Scorers evaluated and scored each response via keypad or mouse entry through the iScore system. When a scorer finished one response, the next response appeared immediately on the computer screen.

Imaged responses from all students were sorted into item-specific groups for scoring purposes. Scorers reviewed responses from only one item at a time; however, imaged responses from all the student's work were always available to leadership for viewing when necessary, and the physical booklet (for paperbased tests) was also available to the Scoring Content Specialist on-site. (Scoring Content Specialist and other scoring roles are described in Section 5.2.1.)

The use of iScore also helped ensure that access to student response images was limited to only those who had legitimate need to access them.

### 5.2.1 Scoring Location and Staff

## Scoring Location

The iScore database, its operation, and its administrative controls are all based in Dover, New Hampshire. Table 5-1 presents the locations where 2017-18 Maine test item responses by content area and grade were scored.

Table 5-1. 2017-18 eMPowerME: Operational Scoring Locations by Content Area and Grade

| Content Area | Grade | Dover, NH | Menands, NY | Longmont, CO |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics | 3 |  |  | x |
|  | 4 |  |  | x |
|  | 5 |  |  | x |
|  | 6 |  |  | x |
|  | 7 |  |  | x |
|  | 8 |  |  | x |
| Reading | 3 |  |  | x |
|  | 4 |  |  | x |
|  | 5 |  |  | x |
|  | 6 |  |  | x |
|  | 7 |  |  | x |
|  | 8 |  |  | x |
| Essay | 4 | x | x | x |
|  | 5 |  |  | x |
|  | 6 |  |  | x |
|  | 7 |  |  | x |
|  | 8 |  |  | x |

The iScore system monitored accuracy, reliability, and consistency across all scoring sites. Constant daily communication and coordination were accomplished in person or through e-mail, telephone, and secure Websites to ensure that critical information and scoring modifications were shared and implemented across all scoring sites.

## Staff Positions

The following staff members were involved with scoring the 2017-18 Maine responses:

- The Scoring Project Manager oversaw communication and coordination of scoring across all scoring sites, and communicated with other departments outside of scoring to ensure timely handoffs to meet deliverables.
- The iScore Operational Manager coordinated technical communication across all scoring sites and managed access to student images based on assignments.
- A Scoring Content Specialist in each content area (mathematics, reading, and essay) ensured consistency of scoring across all scoring sites for all grades tested in that content area.

Scoring Content Specialists also provided read-behind activities (defined in Section 5.2.7) for Scoring Supervisors.

- Numerous Scoring Supervisors, selected from a pool of experienced Scoring Team Leaders for their ability to score accurately and to instruct and train scorers, participated in benchmarking activities for each specific grade and content area. Scoring Supervisors provided read-behind activities (defined in Section 5.2.7) for Scoring Team Leaders at their sites. The ratio of Scoring Supervisors and Scoring Team Leaders to scorers was approximately 1:11.
- Numerous Scoring Team Leaders, selected from a pool of skilled and experienced scorers, provided read-behind activities (defined in Section 5.2.7) for the scorers at their scoring tables.
- Scorers at scoring sites scored operational student responses. Recruitment of scorers is described in Section 5.2.3.

### 5.2.2 Scorer Recruitment and Qualifications

For scoring the 2017-18 Maine tests, Measured Progress actively sought a diverse scoring pool. The broad range of scorer backgrounds included scientists, business professionals, educators, graduate school students, and retired professionals. Demographic information (e.g., gender, race, educational background) about scorers was electronically captured for reporting.

Although a four-year college degree or higher was preferred, scorers were required to have successfully completed at least a two-year college degree and to have demonstrated knowledge of the content area they scored. In all cases, potential scorers were required to submit documentation (e.g., résumé and/or transcripts) of their qualifications.

Table 5-2 summarizes the qualifications of the 2017-18 Maine ELA and mathematics scoring leadership and scorers.

Table 5-2. 2017-18 eMPowerME: Qualifications of Scoring Leadership and ScorersSpring Operational Administration

| Scoring | Educational Credentials |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Responsibility | Doctorate | Master's | Bachelor's | Associate's |  |
| Scoring Leadership | 6 | 21 | 35 | 3 | 65 |
| Scorers | 29 | 109 | 213 | 33 | 384 |

Scoring Leadership = Scoring Supervisors and Scoring Team Leaders

Scorers were either temporary Measured Progress employees or were secured through temporary employment agencies. All scorers were required to sign a nondisclosure/confidentiality agreement.

### 5.2.3 Methodology for Scoring Polytomous Items

## Possible Score Points

The ranges of possible score points for the different polytomous items are shown in Table 5-3.

Table 5-3. 2017-18 eMPowerME: Possible Score Points for Polytomous Item Types

| Polytomous <br> Item Type | Possible Score <br> Point Range |
| :--- | :---: |
| Essay Prompt | $0-4$ scale across 4 traits |
| Constructed-response | $0-2,0-3$, or $0-4$ points |

The rubrics used in essay scoring can be found in appendix F.

In addition, mathematics items were also scored on a mathematical practices scale. The point options for this scale were $0-2$ points for constructed-response items, and $0-1$ points for short-answer items.

## Nonscorable Items

Scorers could designate a response as nonscorable for any of the following reasons:

- Blank: Response was blank (no attempt to respond to the question).
- Unreadable: Response was illegible, too faint to see, or only partially legible/visible. Unreadable responses were extremely rare, since most students completed the test online. Any unreadable paper test books are reviewed by leadership, who review the physical test book, to make all attempts to read and score the student response.
- Wrong Location: Student clearly provided a response to a different question in the wrong answer space. This is only possible on paper-based test books. Any responses marked "wrong location" are reviewed by scoring leadership, and the correct scores for each question are assigned in the system.
- Off Topic: A response that is completely off topic and makes no attempt to answer the question.
- No Score: Any response that cannot be scored for other reasons. This may include artwork irrelevant to the prompt, or other writing that is unrelated to the task.

## Scoring Procedures

Scoring procedures for polytomous items included both single scoring and double-blind scoring. Single-scored items were scored by one scorer. Double-blind scored items were scored independently by two scorers, whose scores were tracked for interrater agreement. A minimum of $20 \%$ of all responses were scored by two scorers. Essay responses were scored at a $25 \%$ double scored rate.

### 5.2.4 Scorer Training

Scorer training began with an introduction of the on-site scoring staff and an overview of the purpose and goals of the test, including discussion about the security, confidentiality, and proprietary nature of testing materials, scoring materials, and procedures.

Next, scorers thoroughly reviewed and discussed the scoring guides for each item to be scored. Each item-specific scoring guide included the item itself and score point descriptions.

Following review of an item's scoring guide, Scoring Supervisors led a training on the anchor set. Scorers then applied their training to score a practice set, followed by a group review of this set. At the conclusion of training, each scorer independently took a qualification set to demonstrate that he or she had understood the item training and was able to consistently and accurately apply the scoring standards to student work.

## Anchor Set

Scorers first reviewed an anchor set of exemplary responses for an item. This set represents clear examples of each score point.

Responses were read aloud to the room of scorers in descending score order. After announcing the true score of each anchor response, trainers facilitated group discussion of responses in relation to score point descriptions to help scorers internalize the typical characteristics of score points.

This anchor set continued to serve as a reference for scorers as they went on to calibration, scoring, and recalibration activities for that item.

## Practice Set

Next, scorers practiced applying the scoring guide and anchors to responses in the practice set. The practice set typically included 8 to 15 student responses designed to help establish both the full score-point range and the range of possible responses within each score point. The practice set often included unusual responses that were less clear or solid (shorter than normal, employing atypical approaches, simultaneously containing very low and very high attributes, and written in ways difficult to decipher). Responses in the training set were presented in randomized score-point order.

After scorers independently read and scored the practice set responses, trainers would poll scorers or use online training system reports to record their initial range of scores. Trainers then led a group discussion of responses, directing scorers' attention to difficult scoring issues. Throughout the training, trainers modeled how to discuss scores by referring to the anchor set and to scoring guides.

## Qualifying Set

After the practice set had been completed, scorers were required to score responses accurately and reliably in qualifying sets. The 10 responses in each qualifying set were selected from an array of responses that clearly illustrated the range of score points for that item as reviewed and approved by scoring leadership.

To be eligible to live-score reading and mathematics items, scorers were required to demonstrate scoring accuracy rates of at least $80 \%$ exact and at least $90 \%$ exact plus adjacent agreement. For mathematics items, qualification was based on the primary content scoring scale, and not the mathematical practices scale. In other words, scorers were allowed one discrepant score (one score of 10 that was more than 1 score point from the predetermined score), provided they had at least eight exact scores. Essays were not included on the operational test this year, but will return to a $70 \%$ exact and $90 \%$ exact plus adjacent rate in future years.

## Retraining

Scorers who did not pass the first qualifying set were retrained as a group by reviewing their performance with scoring leadership and then scoring a second qualifying set of responses. If they achieved the required accuracy rate on the second qualifying set, they were allowed to score operational responses.

Scorers who did not achieve the required scoring accuracy rates on the second qualifying set were not allowed to score responses for that item. Instead, they either began training on a different item or were dismissed from scoring for that day.

### 5.2.5 Leadership Training

Scoring Supervisors and select Scoring Team Leaders were trained in a separate training session immediately prior to scorer training. In addition to a discussion of the items and their responses, Scoring Supervisor and Scoring Team Leader training included greater detail on the rationale behind the score points than that covered with regular scorers, in order to better equip Scoring Supervisors and Scoring Team Leaders to handle questions from the scorers.

### 5.2.6 Monitoring of Scoring Quality Control

Scorers were monitored for continued accuracy and consistency throughout the scoring process, using the following methods and tools (which are defined in this section):

- embedded committee-reviewed responses (CRRs)
- read-behind procedures
- double-blind scoring
- recalibration sets

It should be noted that any scorer whose accuracy rate fell below the expected rate for a particular item and monitoring method was retrained on that item. Upon approval by the Scoring Supervisor or Scoring Content Specialist, the scorer was allowed to resume scoring. Scorers who met or exceeded the expected accuracy rates continued scoring.

## Embedded CRRs

CRRs are previously scored responses that are loaded ("embedded") by scoring leadership into iScore and distributed blindly to scorers during scoring. Embedded CRRs may be chosen either before or during scoring and are inserted into the scoring queue so that they appear the same as all other live student responses.

Embedded CRRs were distributed at random points throughout the first full day of scoring to ensure that scorers were sufficiently calibrated at the beginning of the scoring period. Each scorer received the embedded set in a random order, mixed in with live student images.

Any scorer who fell below the required scoring accuracy rate was retrained before being allowed by the Scoring Supervisor to continue scoring. Once allowed to resume scoring, scoring leadership carefully monitored these scorers by increasing the number of read-behinds (defined next in Read-Behind Scoring Procedures).

## Read-Behind Scoring Procedures

Read-behind scoring refers to scoring leadership (usually a Scoring Team Leader) scoring a response after a scorer has already scored the response. The practice was applied to all constructed-response item types.

Responses placed into the read-behind queue were randomly selected by scoring leadership; scorers were not aware which of their responses would be reviewed by their Scoring Team Leader.

The Scoring Team Leader entered his or her score into iScore before being allowed to see the scorer's score. The Scoring Team Leader then compared the two scores and the score of record was determined as follows:

- If there was exact agreement between the scores, no action was necessary; the regular scorer's score remained.
- If the scores were adjacent (differed by 1 point), the Scoring Team Leader's score became the score of record. A significant number of adjacent scores for a scorer triggered an individual scoring consultation with scoring leadership, after which the Scoring Supervisor determined whether or when the scorer could resume scoring.
- If the scores were discrepant (differed by more than 1 point), the Scoring Team Leader's score became the score of record. This triggered an individual consultation for the scorer with scoring leadership, after which the Scoring Supervisor determined whether or when the scorer could resume scoring on that item.

Table 5-4 illustrates how scores were resolved by read-behind.

Table 5-4. 2017-18 eMPowerME: Examples of Read-Behind Scoring Resolutions

| Scorer <br> Score | Scoring Supervisor/SR <br> Score | Score of <br> Record |
| :---: | :---: | :---: |
| 4 | 4 | 4 |
| 4 | 3 | 3 |
| 1 | 3 | 3 |

Scoring Team Leaders were tasked with conducting, at a minimum, five read-behinds per scorer per day; however, Scoring Team Leaders routinely performed more read-behinds than the minimum threshold and focused additional attention on scorers who were at the lower end of the acceptable performance threshold.

Scoring Supervisors and Content Specialists have the ability to review the read-behinds conducted by Scoring Team Leaders, to ensure that they are in agreement with the Scoring Team Leaders as an additional level of quality control.

## Double-Blind Scoring

Double-blind scoring refers to two scorers independently scoring a response without knowing whether the response was to be double-blind scored. The practice was applied to all constructed-response item types. Table 5-5 shows by which method(s) the responses to both common and equating constructed-response item types for each operational test were scored.

Table 5-5. 2017-18 eMPowerME: Frequency of Double-Blind Scoring by Grade and Content

| Grade | Content Area | Responses Double- <br> Blind Scored |
| :---: | :---: | :---: |
|  | Reading | $20 \%$ |
|  | Mathematics | $20 \%$ |
|  | Essay | $25 \%$ |

If there was a discrepancy (a difference greater than one score point) between double-blind scores, the response was placed into an arbitration queue. Arbitration responses were reviewed by scoring leadership (Scoring Team Leader or Scoring Supervisor) without knowledge of the two scorers' scores. Scoring leadership assigned the final score.

Scoring leadership consulted individually with any scorer whose scoring rate fell below the required accuracy rate, and the Scoring Supervisor determined whether or when the scorer could resume scoring on that item. Once the scorer was allowed to resume scoring, scoring leadership carefully monitored the scorer's accuracy by increasing the number of read-behinds.

## Recalibration Sets

To determine whether scorers were still calibrated to the scoring standard, they were required to take an online recalibration set starting with the second day of scoring each item.

Each recalibration set consisted of five items and could include any possible score points for the item. Every score point did not always appear in each set, to prevent having a predictable score point distribution.

Any scorer who did not perform well on the recalibration set was counseled prior to being allowed to start scoring. Scoring Team Leaders conducted additional early read-behinds on these scorers to ensure that they were scoring accurately.

Recalibration sets were employed for all constructed-response items.

## Scoring Reports

Measured Progress's electronic scoring software, iScore, generated multiple reports that were used by scoring leadership to measure and monitor scorers for scoring accuracy, consistency, and productivity. These reports were used in conjunction with scoring leadership input of scorer performance to determine if scorers were scoring at acceptable levels of accuracy. When scorers were not accurate, their work for the day was voided and was rescored by other qualified scorers.

## CHAPTER 6 CLASSICAL ITEM ANALYSIS

As noted in Brown (1983), "A test is only as good as the items it contains." A complete evaluation of a test's quality must include an evaluation of each item. Both Standards for Educational and Psychological Testing (AERA, APA, \& NCME, 2014) and Code of Fair Testing Practices in Education (Joint Committee on Testing Practices, 2004) include standards for identifying quality items. Items should assess only knowledge or skills that are identified as part of the domain being tested and should avoid assessing irrelevant factors. Items should also be unambiguous and free of grammatical errors, potentially insensitive content or language, and other confounding characteristics. In addition, items must not unfairly disadvantage students, in particular racial, ethnic, or gender groups.

Both qualitative and quantitative analyses are conducted to ensure that eMPowerME items meet these standards. Qualitative analyses are described in earlier chapters of this report; this chapter focuses on quantitative evaluations. Statistical evaluations are presented in four parts: (1) difficulty indices, (2) item-test correlations, (3) differential item functioning (DIF) statistics, and (4) dimensionality analyses. The item analyses presented here are based on the statewide administration of eMPowerME in spring 2017. Note that the information presented in this chapter is based on the items common to all forms, since those are the items on which student scores are calculated. (Item analyses are also performed for field-test items, and the statistics are then used during the item review process and form assembly for future administrations.)

### 6.1 CLassical Difficulty and Discrimination Indices

All selected-response, evidence-based selected-response, and constructed-response items are evaluated in terms of item difficulty according to standard classical test theory practices. Difficulty is defined as the average proportion of points achieved on an item and is measured by obtaining the average score on an item and dividing it by the maximum possible score for the item. Selected-response items are scored dichotomously (correct versus incorrect), so, for these items, the difficulty index is simply the proportion of students who correctly answered the item. Polytomously scored items include evidence-based selectedresponse items, for which students can receive scores of 0,1 , or 2 , and constructed-response items, which are worth 2,3 , or 4 points total. By computing the difficulty index as the average proportion of points achieved, the indices for the different item types are placed on a similar scale, ranging from 0.0 to 1.0 , regardless of the item type. Although this index is traditionally described as a measure of difficulty, it is properly interpreted as an easiness index, because larger values indicate easier items. An index of 0.0 indicates that all students received no credit for the item, and an index of 1.0 indicates that all students received full credit for the item.

Items that are answered correctly by almost all students provide little information about differences in student abilities, but do indicate knowledge or skills that have been mastered by most students. Similarly, items that are correctly answered by very few students provide little information about differences in student
abilities, but may indicate knowledge or skills that have not yet been mastered by most students. In general, to provide the best measurement, difficulty indices should range from near-chance performance of 0.25 (for four-option selected-response items or essentially 0 for constructed-response items) to 0.90 , with the majority of items generally falling between approximately 0.2 and 0.8 for ELA and mathematics items. However, on a standards-referenced assessment such as eMPowerME, it may be appropriate to include some items with very low or very high item difficulty values to ensure sufficient content coverage.

A desirable characteristic of an item is for higher-ability students to perform better on the item than lower-ability students do. The correlation between student performance on a single item and total test score is a commonly used measure of this characteristic of the item. Within classical test theory, the item-test correlation is referred to as the item's discrimination, because it indicates the extent to which successful performance on an item discriminates between high and low scores on the test. For constructed-response items, the item discrimination index used was the Pearson product-moment correlation; for selected-response items, the corresponding statistic is commonly referred to as a point-biserial correlation. The theoretical range of these statistics is -1.0 to 1.0 , with a typical observed range from 0.2 to 0.6 .

Discrimination indices can be thought of as measures of how closely an item assesses the same knowledge and skills assessed by other items contributing to the criterion total score. That is, the discrimination index can be thought of as a measure of construct consistency.

A summary of the item difficulty and item discrimination statistics for each content area and grade is presented in Table 6-1. Note that the statistics are presented for all items as well as by item type (selectedresponse and constructed-response). The mean difficulty and discrimination values shown in the table are within generally acceptable and expected ranges.

Table 6-1. 2017-18 eMPowerME: Summary of Item Difficulty and Discrimination Statistics by Grade

| Content Area | Grade | $\begin{aligned} & \text { Item } \\ & \text { Type } \end{aligned}$ | Number of Items | $p$-Value |  | Discrimination |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Mean | Standard Deviation | Mean | Standard Deviation |
| Mathematics | 3 | ALL | 41 | 0.48 | 0.21 | 0.37 | 0.09 |
|  |  | SR | 31 | 0.56 | 0.15 | 0.35 | 0.07 |
|  |  | CR | 10 | 0.22 | 0.13 | 0.46 | 0.10 |
|  | 4 | ALL | 40 | 0.45 | 0.20 | 0.38 | 0.12 |
|  |  | SR | 30 | 0.53 | 0.16 | 0.35 | 0.10 |
|  |  | CR | 10 | 0.21 | 0.10 | 0.50 | 0.06 |
|  | 5 | ALL | 41 | 0.42 | 0.16 | 0.36 | 0.12 |
|  |  | SR | 32 | 0.46 | 0.16 | 0.33 | 0.10 |
|  |  | CR | 9 | 0.29 | 0.11 | 0.49 | 0.11 |
|  | 6 | ALL | 44 | 0.43 | 0.19 | 0.33 | 0.14 |
|  |  | SR | 35 | 0.49 | 0.15 | 0.29 | 0.10 |

| Content Area | Grade | $\begin{aligned} & \text { Item } \\ & \text { Type } \end{aligned}$ | Number of Items | $p$-Value |  | Discrimination |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Mean | Standard Deviation | Mean | Standard Deviation |
| Mathematics | 6 | CR | 9 | 0.19 | 0.14 | 0.48 | 0.16 |
|  | 7 | ALL | 44 | 0.45 | 0.20 | 0.38 | 0.12 |
|  |  | SR | 33 | 0.55 | 0.12 | 0.35 | 0.10 |
|  |  | CR | 11 | 0.18 | 0.10 | 0.45 | 0.13 |
|  | 8 | ALL | 45 | 0.40 | 0.17 | 0.33 | 0.14 |
|  |  | SR | 35 | 0.47 | 0.13 | 0.28 | 0.12 |
|  |  | CR | 10 | 0.17 | 0.10 | 0.51 | 0.06 |
| ELA | 3 | ALL | 48 | 0.53 | 0.16 | 0.39 | 0.10 |
|  |  | SR | 38 | 0.57 | 0.14 | 0.36 | 0.08 |
|  |  | CR | 10 | 0.38 | 0.17 | 0.50 | 0.05 |
|  | 4 | ALL | 49 | 0.54 | 0.15 | 0.37 | 0.11 |
|  |  | SR | 39 | 0.58 | 0.14 | 0.35 | 0.10 |
|  |  | CR | 10 | 0.40 | 0.13 | 0.45 | 0.12 |
|  | 5 | ALL | 49 | 0.55 | 0.13 | 0.38 | 0.12 |
|  |  | SR | 39 | 0.57 | 0.13 | 0.35 | 0.11 |
|  |  | CR | 10 | 0.48 | 0.14 | 0.49 | 0.10 |
|  | 6 | ALL | 49 | 0.56 | 0.18 | 0.37 | 0.10 |
|  |  | SR | 39 | 0.59 | 0.18 | 0.35 | 0.09 |
|  |  | CR | 10 | 0.42 | 0.13 | 0.47 | 0.09 |
|  | 7 | ALL | 49 | 0.54 | 0.15 | 0.38 | 0.10 |
|  |  | SR | 39 | 0.57 | 0.14 | 0.35 | 0.09 |
|  |  | CR | 10 | 0.41 | 0.09 | 0.48 | 0.10 |
|  | 8 | ALL | 49 | 0.59 | 0.15 | 0.37 | 0.11 |
|  |  | SR | 39 | 0.62 | 0.14 | 0.35 | 0.08 |
|  |  | CR | 10 | 0.46 | 0.15 | 0.48 | 0.13 |

A comparison of indices across grade levels is complicated because these indices are populationdependent. Direct comparisons would require that either the items or students were common across groups. Since that is not the case, it cannot be determined whether differences in performance across grade levels are because of differences in student abilities, differences in item difficulties, or both. With this caveat in mind, it appears generally that, for mathematics, students in higher grade levels found their items more difficult than students in lower grades found their items, while, for ELA, difficulty indices were more consistent across grades.

Comparing the difficulty indices of selected-response items and constructed-response (evidencebased selected-response or constructed-response) items is inappropriate because selected-response items can be answered correctly by guessing. Thus, it is not surprising that the difficulty indices for selected-response items tend to be higher (indicating that students performed better on these items) than the difficulty indices for constructed-response items. Similarly, discrimination indices for the constructed-response items were larger than those for the dichotomous items because of the greater variability of the former (i.e., the partial
credit these items allow) and the tendency for correlation coefficients to be higher, given greater variances of the correlates.

In addition to the item difficulty and discrimination summaries, item-level classical statistics and item-level score point distributions were also calculated. Item-level classical statistics are provided in Appendix G, where item difficulty and discrimination values are presented for each item. The item difficulty and discrimination indices are within generally acceptable and expected ranges. Very few items were answered correctly at near-chance or near-perfect rates. Similarly, the positive discrimination indices indicate that students who performed well on individual items tended to perform well overall. There were a small number of items with low or negative discrimination indices. While it is not inappropriate to include items with low discrimination values or with very high or very low item difficulty values to ensure that content is appropriately covered, there were very few such cases on the eMPowerME. Item-level score point distributions are provided for constructed-response items in Appendix H ; for each item, the percentage of students who received each score point is presented.

### 6.2 Differential Item Functioning

Code of Fair Testing Practices in Education (Joint Committee on Testing Practices, 2004) explicitly states that subgroup differences in performance should be examined when sample sizes permit, and that actions should be taken to ensure that differences in performance are because of construct-relevant, rather than construct-irrelevant, factors. The Standards for Educational and Psychological Testing (AERA et al., 2014) includes similar guidelines. As part of the effort to identify such problems, an evaluation of the eMPowerME items was conducted in terms of DIF statistics.

For eMPowerME, the standardization DIF procedure (Dorans \& Kulick, 1986) was employed to evaluate subgroup differences. The standardization DIF procedure is designed to identify items for which subgroups of interest perform differently, beyond the impact of differences in overall achievement. The DIF procedure calculates the difference in item performance for two groups of students (at a time) matched for achievement on the total test. Specifically, average item performance is calculated for students at every total score. Then an overall average is calculated, weighting the total score distribution so that it is the same for the two groups. In order to calculate DIF statistics, a minimum of 200 students must be in each comparison group.

When differential performance between two groups occurs on an item (i.e., a DIF index in the "low" or "high" categories, explained in the following paragraph), it may or may not be indicative of item bias. Course-taking patterns or differences in school curricula can lead to DIF, but for construct-relevant reasons. On the other hand, if subgroup differences in performance could be traced to differential experience (such as geographical living conditions or access to technology), the inclusion of such items should be reconsidered.

Computed DIF indices have a theoretical range from -1.0 to 1.0 for selected-response items, and the index is adjusted to the same scale for constructed-response items. Dorans and Holland (1993) suggested that
index values between -0.05 and 0.05 should be considered negligible. The preponderance of eMPowerME items fell within this range. Dorans and Holland further stated that items with values between -0.10 and -0.05 and between 0.05 and 0.10 (i.e., "low" DIF) should be inspected to ensure that no possible effect is overlooked, and that items with values outside the -0.10 to 0.10 range (i.e., "high" DIF) are more unusual and should be examined very carefully.

For the 2017-18 eMPowerME tests, seven subgroup comparisons were evaluated for DIF:

- male versus female
- no disability versus disability
- non-economically disadvantaged versus economically disadvantaged
- non-LEP versus LEP
- White versus Asian
- White versus Black
- White versus Hispanic

The tables in Appendix I present the numbers of items classified, overall and by group favored, as either "low" or "high" DIF.

### 6.3 Dimensionality Analysis

Because tests are constructed with multiple content area subcategories and their associated knowledge and skills, the potential exists for a large number of dimensions being invoked beyond the common primary dimension. Generally, the subcategories are highly correlated with each other; therefore, the primary dimension they share typically explains an overwhelming majority of variance in test scores. In fact, the presence of just such a dominant primary dimension is the psychometric assumption that provides the foundation for the unidimensional IRT models that are used for calibrating, linking, scaling, and equating the 2017-18 eMPowerME forms.

The purpose of dimensionality analysis is to investigate whether violation of the assumption of test unidimensionality is statistically detectable and, if so, (1) the degree to which unidimensionality is violated and (2) the nature of the multidimensionality. Findings from dimensionality analyses performed on the 201718 eMPowerME common items for mathematics and ELA, (which includes reading and writing) in grades 3-8 are reported below. (Note: only common items were analyzed since they are used for score reporting.)

The dimensionality analyses were conducted using the nonparametric IRT-based methods DIMTEST (Stout, 1987; Stout, Froelich, \& Gao, 2001) and DETECT (Zhang \& Stout, 1999). Both methods use as their basic statistical building block the estimated average conditional covariances for item pairs. A conditional covariance is the covariance between two items conditioned on expected total score for the rest of the test, and the average conditional covariance is obtained by averaging over all possible conditioning scores. When a test
is strictly unidimensional, all conditional covariances are expected to take on values within random noise of zero, indicating statistically independent item responses for examinees with equal expected total test scores. Non-zero conditional covariances are essentially violations of the principle of local independence, and local dependence implies multidimensionality. Thus, non-random patterns of positive and negative conditional covariances are indicative of multidimensionality.

DIMTEST is a hypothesis-testing procedure for detecting violations of local independence. The data are first divided into a training sample and a cross-validation sample. Then an exploratory analysis of the conditional covariances is conducted on the training sample data to find the cluster of items that displays the greatest evidence of local dependence. The cross-validation sample is then used to test whether the conditional covariances of the selected cluster of items display local dependence, conditioning on total score on the non-clustered items. The DIMTEST statistic follows a standard normal distribution under the null hypothesis of unidimensionality.

DETECT is an effect-size measure of multidimensionality. As with DIMTEST, the data are first divided into a training sample and a cross-validation sample (these samples are drawn independently of those used with DIMTEST). The training sample is used to find a set of mutually exclusive and collectively exhaustive clusters of items that best fit a systematic pattern of positive conditional covariances for pairs of items from the same cluster, and negative conditional covariances for pairs composed of items from different clusters. Next, the clusters from the training sample are used with the cross-validation sample data to average the conditional covariances: within-cluster conditional covariances are summed; from this sum the betweencluster conditional covariances are subtracted, this difference is divided by the total number of item pairs, and this average is multiplied by 100 to yield an index of the average violation of local independence for an item pair. DETECT values less than 0.2 indicate very weak multidimensionality (or near unidimensionality); values of 0.2 to 0.4 , weak to moderate multidimensionality; values of 0.4 to 1.0 , moderate to strong multidimensionality; and values greater than 1.0 very strong multidimensionality (Roussos \& Ozbek, 2006). DIMTEST and DETECT were applied to the 2017-18 eMPowerME assessments. The data for each grade and content area were split into a training sample and a cross-validation sample. Every grade/content area test had at least 12,800 student examinees, so every training sample and cross-validation sample had at least 6,400 students. DIMTEST was then applied to every grade/content area. DETECT was applied to each dataset for which the DIMTEST null hypothesis was rejected in order to estimate the effect size of the multidimensionality.

Because of the large sample sizes for the eMPowerME tests, DIMTEST would be expected to be sensitive to even quite small violations of unidimensionality. Thus, it was not surprising to find that the DIMTEST null hypothesis of unidimensionality was strongly rejected for every dataset ( $\mathrm{p} \leq 0.00005$ ). Because of the large sample sizes employed in the datasets, it was important to use DETECT to estimate the effect size of the violations of local independence found by DIMTEST. Table 8-11 displays the multidimensional effect size estimates from DETECT for the eMPowerME tests.

All 12 DETECT values indicated either weak or very weak multidimensionality. The DETECT values for ELA tended to be slightly lower than the values for mathematics. We also investigated how DETECT divided the tests into clusters to see if there were any discernible patterns with respect to item type or subcategory content. There was no strong evidence of separation of selected-response and constructedresponse (CR) items; however, ELA grade 8 showed moderate separation between selected-response and CR items. In the ELA tests, for each grade there was some evidence suggesting separation of reading and writing in each grade, but there was also evidence of them mixing together.

## Table 6-2. 2017-18 eMPowerME: Multidimensional Effect Sizes by Content Area and Grade

| Content Area | Grade | Multidimensionality Effect Size |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $2015-16$ | $2016-17$ | $2017-18$ |
| ELA | 3 | 0.16 | 0.17 | 0.12 |
|  | 4 | 0.17 | 0.20 | 0.19 |
|  | 5 | 0.17 | 0.16 | 0.16 |
|  | 6 | 0.17 | 0.15 | 0.17 |
|  | 7 | 0.16 | 0.15 | 0.16 |
|  | 8 | 0.16 | 0.18 | 0.19 |
| Mathematics | Average | 0.17 | 0.17 | 0.17 |
|  | 3 | 0.19 | 0.27 | 0.22 |
|  | 4 | 0.18 | 0.20 | 0.22 |
|  | 5 | 0 | 0.29 | 0.28 |
|  | 7 | 0.24 | 0.12 | 0.18 |
|  | 8 | 0.19 | 0.17 | 0.14 |
|  | Average | 0.21 | 0.22 | 0.15 |

In summary, the dimensionality analyses indicated that all the tests exhibited rejection of the null hypothesis of unidimensionality, but also that the violations of local independence were all weak in magnitude. The violations of local independence did not show strong evidence in ELA or mathematics as being related to the differences between selected-response and constructed-response items. For the ELA tests, there was some evidence of reading and writing being separate dimensions. Still, these violations of local independence were very weak in magnitude and were detectable only because of the large sample sizes. A more in-depth substantive analysis of the results by content experts would be needed to more precisely describe a fuller picture of the multidimensionality in all these tests.

## CHAPTER 7 ITEM RESPONSE THEORY SCALING AND EQUATING

This chapter describes the procedures used to calibrate and scale the eMPowerME tests. During these psychometric analyses, a number of quality-control procedures and checks on the processes were implemented. These procedures included evaluations of the calibration processes (e.g., checking the number of Newton cycles required for convergence for reasonableness, checking item parameters and their standard errors for reasonableness, examination of Test Characteristic Curves [TCCs] and Test Information Functions [TIFs] for reasonableness); evaluation of model fit; and evaluation of the scaling results (e.g., parallel processing by the Psychometrics and Research Department and Data and Reporting Services Department; comparing look-up tables).

Table 7-1 lists items that required intervention either during item calibration or as a result of the evaluations of the equating items. For each flagged item, the table shows the reason it was flagged and what action was taken. The number of items identified for evaluation was very typical across the grades. Descriptions of the evaluations and results are included in Section 7.2 Item Response Theory Results and Section 7.4 Equating Results.

Table 7-1. 2017-18 eMPowerME: Items That Required Intervention
During IRT Calibration and Equating

| Content Area | Grade | Item | Reason | Action |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics | 3 | 411577 | b/b analysis | removed from equating |
|  | 4 | 124946A | c-parameter | set $\mathrm{C}=0$ |
|  | 4 | 551343B | a-parameter | a set to initial |
|  | 5 | 400076 | b/b analysis | removed from equating |
|  | 5 | 415252 | delta analysis | removed from equating |
|  |  | 400092 | c-parameter | set c = 0 |
|  | 6 | 400114 | b/b analysis | removed from equating |
|  |  | 400411 | c-parameter | set $\mathrm{c}=0$ |
|  | 7 | 124360A | delta analysis | removed from equating |
|  | 7 | 467833 | b/b analysis | removed from equating |
|  |  | 408795 | c-parameter | set c = 0 |
|  |  | 409018 | a-parameter | a set to initial |
|  | 8 | 409018 | c-parameter | set c = 0.26 |
|  |  | 409018 | $\mathrm{b} / \mathrm{b}$ analysis | removed from equating |
|  |  | 414766 | delta analysis | removed from equating |
| ELA | 3 | 128593A | delta analysis | removed from equating |
|  |  | 418629 | c-parameter | set $\mathrm{c}=0$ |
|  |  | 459509 | c-parameter | set $\mathrm{c}=0$ |
|  |  | 459519 | c-parameter | set $\mathrm{C}=0$ |
|  | 4 | 130706A | c-parameter | set $\mathrm{c}=0$ |

| Content Area | Grade | Item | Reason | Action |
| :---: | :---: | :---: | :---: | :---: |
| ELA | 4 | 130712A | c-parameter | set c $=0$ |
|  |  | 420785 | c-parameter | set $\mathrm{c}=0$ |
|  |  | 421213 | c-parameter | set c $=0$ |
|  |  | 421216 | delta analysis | removed from equating |
|  |  | 421799 | c-parameter | set c = 0 |
|  |  | 421799 | $\mathrm{b} / \mathrm{b}$ analysis | removed from equating |
|  |  | 472577 | c-parameter | set $\mathrm{C}=0$ |
|  |  | 476102 | $\mathrm{b} / \mathrm{b}$ analysis | removed from equating |
|  | 5 | 419302 | c-parameter | set c $=0$ |
|  |  | 458560 | c-parameter | set c $=0$ |
|  |  | 458565 | c-parameter | set c $=0$ |
|  |  | 478338 | b/b analysis | removed from equating |
|  |  | 478360 | delta analysis | removed from equating |
|  | 6 | 129252A | c-parameter | set c = 0 |
|  |  | 413439 | c-parameter | set c $=0$ |
|  |  | 413439 | $\mathrm{b} / \mathrm{b}$ analysis | removed from equating |
|  |  | 413445 | c-parameter | set $\mathrm{C}=0$ |
|  |  | 419859 | c-parameter | set $\mathrm{c}=0$ |
|  |  | 420260 | c-parameter | set c $=0$ |
|  |  | 464586 | delta analysis | removed from equating |
|  | 7 | 131166A | $\mathrm{b} / \mathrm{b}$ analysis | removed from equating |
|  |  | 409979 | c-parameter | set $\mathrm{C}=0$ |
|  |  | 416732 | a-parameter | a set to initial |
|  |  | 416732 | c-parameter | set c $=0$ |
|  | 8 | 402075 | c-parameter | set c $=0$ |
|  |  | 402111 | c-parameter | set c = 0 |
|  |  | 420872 | c-parameter | set c $=0$ |
|  |  | 420905 | c-parameter | set c = 0 |
|  |  | 420970 | c-parameter | set $\mathrm{C}=0$ |
|  |  | 461925 | c-parameter | set c = 0 |
|  |  | 475545 | delta analysis | removed from equating |
|  |  | 475555 | c-parameter | set c = 0 |

### 7.1 Item Response Theory

All eMPowerME items were calibrated using item response theory (IRT). IRT uses mathematical models to define a relationship between an unobserved measure of student proficiency, usually referred to as theta $(\theta)$, and the probability $(p)$ of getting a dichotomous item correct or of getting a particular score on a polytomous item. In IRT, all items are assumed to be independent measures of the same construct (i.e., of the same $\theta$ ). Another way to think of $\theta$ is as a mathematical representation of the latent trait of interest. Several common IRT models are used to specify the relationship between $\theta$ and $p$ (Hambleton \& van der Linden, 1997; Hambleton \& Swaminathan, 1985). The process of determining the specific mathematical relationship between $\theta$ and $p$ is called item calibration. After items are calibrated, they are defined by a set of parameters that specify a nonlinear, monotonically increasing relationship between $\theta$ and $p$. Once the item parameters are known, an estimate of $\theta$ for each student can be calculated. This estimate, $\hat{\theta}$, is considered to be an estimate of
the student's true score or a general representation of student performance. It has characteristics that may be preferable to those of raw scores for equating purposes.

For the 2017-18 eMPowerME tests, the three-parameter logistic (3PL) model was used for dichotomous (selected-response) items and the Graded-Response Model (GRM) was used for polytomous (constructed-response) items. The 3PL model for dichotomous items can be defined as:

$$
P_{i}\left(\theta_{j}\right)=c_{i}+\left(1-c_{i}\right) \frac{\exp \left[D a_{i}\left(-b_{i}\right)\right]}{1+\exp \left[D a_{i}\left(\theta_{j}-b_{i}\right)\right]}
$$

where
$i$ indexes the items,
$j$ indexes students,
$\alpha$ represents item discrimination,
$b$ represents item difficulty,
$c$ is the pseudo-guessing parameter, and
$D$ is a normalizing constant equal to 1.701 .
In the GRM for polytomous items, an item is scored in a $k+1$ graded category that can be viewed as a set of $k$ dichotomies. At each point of dichotomization (i.e., at each threshold), a two-parameter model can be used. This implies that a polytomous item with a $k+1$ category can be characterized by $k$ Item Category Threshold Curves (ICTCs) of the two-parameter logistic form:

$$
P_{i k}^{*}\left(k \mid \theta_{j}\right)=\frac{\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{i k}\right)\right]}{1+\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{i k}\right)\right]}
$$

where
$i$ indexes the items,
$j$ indexes students,
$k$ indexes threshold,
$\alpha$ represents item discrimination,
$b$ represents item difficulty,
$d$ represents threshold, and
$D$ is a normalizing constant equal to 1.701 .
After computing $k$ ICTCs in the GRM, $k+1$ Item Category Characteristic Curves (ICCCs) are derived by subtracting adjacent ICTCs:

$$
P_{i k}\left(\theta_{j}\right)=P_{i(k-1)}^{*}\left(\theta_{j}\right)-P_{i k}^{*}\left(\theta_{j}\right)
$$

where
$P_{i k}$ represents the probability that the score on item $i$ falls in category $k$, and
$P_{i k}^{*}$ represents the probability that the score on item $i$ falls above the threshold $k$
( $P_{i 0}^{*}=1$ and $P_{i(m+1)}^{*}=0$ ).

The GRM is also commonly expressed as:

$$
P_{i k}\left(k \mid \theta_{j}\right)=\frac{\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{k}\right)\right]}{1+\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{k}\right)\right]}-\frac{\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{k+1}\right)\right]}{1+\exp \left[D a_{i}\left(\theta_{j}-b_{i}+d_{k+1}\right)\right]},
$$

where
$i$ indexes the items,
$j$ indexes students,
$k$ indexes threshold,
$\alpha$ represents item discrimination,
$b$ represents item difficulty,
$d$ represents threshold, and
$D$ is a normalizing constant equal to 1.701 .

Finally, the Item Characteristic Curve (ICC) for polytomous items is computed as a weighted sum of ICCCs, where each ICCC is weighted by a score assigned to a corresponding category:

$$
P_{i}\left(\theta_{j}\right)=\sum_{k}^{m+1} w_{i k} P_{i k}\left(\theta_{j}\right)
$$

For more information about item calibration and determination, the reader is referred to Lord and Novick (1968), Hambleton and Swaminathan (1985), or Baker and Kim (2004).

### 7.1.1 Essay Prompt

Each essay prompt response is scored on four dimensions, with scores on each dimension ranging from 0 to 4. Inspection of the Pearson correlations among the dimension scores prompted concerns about whether the assumption of local independence was met. To address local dependence, the scores on the four dimensions per essay prompt response were averaged and rounded to the nearest integer. The rounded mean dimension scores were then used for calibration, scoring, and student performance level determinations. In each grade, the operational essay prompt was placed onto the ELA scale via a fixed common item parameter (FCIP) approach. First, with the operational essay prompt excluded from the data, calibration and Stocking-Lord equating was performed in each grade (see Section 2.3) to obtain item parameters that were placed onto the previous year's scale. Second, the item parameters for all items except for the essay prompt were fixed to the values obtained in the first step, and the item parameters for the essay prompt were estimated (based on the rounded mean dimension scores).

### 7.2 Item Response Theory Results

The tables in Appendix J give the IRT item parameters of all common items on the 2017-18 eMPowerME tests by grade and content area. In addition, Appendix K shows graphs of the TCCs and TIFs, which are defined below.

TCCs display the expected (average) raw score associated with each $\theta_{j}$ value between -4.0 and 4.0. Mathematically, the TCC is computed by summing the ICCs of all items that contribute to the raw score. Using the notation introduced in Section 7.1, the expected raw score at a given value of $\theta_{j}$ is

$$
E\left(X \mid \theta_{j}\right)=\sum_{i=1}^{n} P_{i}\left(\theta_{j}\right),
$$

where
$i$ indexes the items (and $n$ is the number of items contributing to the raw score),
$j$ indexes students (here, $\theta_{j}$ runs from -4 to 4 ), and
$E\left(X \mid \theta_{j}\right)$ is the expected raw score for a student of ability $\theta_{j}$.
The expected raw score monotonically increases with $\theta_{j}$, consistent with the notion that students of high ability tend to earn higher raw scores than do students of low ability. Most TCCs are "S-shaped"-flatter at the ends of the distribution and steeper in the middle.

The TIF displays the amount of statistical information the test provides at each value of $\theta_{j}$.
Information functions depict test precision across the entire latent trait continuum. There is an inverse relationship between the information of a test and its standard error of measurement (SEM). For long tests, the SEM at a given $\theta_{j}$ is approximately equal to the inverse of the square root of the statistical information at $\theta_{j}$ (Hambleton, Swaminathan, \& Rogers, 1991), as follows:

$$
\operatorname{SEM}\left(\theta_{j}\right)=\frac{1}{\sqrt{I\left(\theta_{j}\right)}}
$$

Compared to the tails, TIFs are often higher near the middle of the $\theta$ distribution, where most students are located and where most items are sensitive by design.

Table 7-1 lists items that were flagged based on the quality-control checks implemented during the calibration process. (Note that some items were flagged as a result of the evaluations of the equating items; those results are described below.) In all cases, items flagged during this step were identified because of the pseudo-guessing parameter ( $c$ parameter) being poorly estimated. Difficulty in estimating the $c$ parameter is not at all unusual and is well documented in psychometric literature (see, e.g., Nering \& Ostini, 2010), especially when the item's discrimination is below 0.50 . In all cases, fixing the $c$ parameter resulted in reasonable and stable item parameter estimates and improved model fit.

The number of Newton cycles required for convergence for each grade and content area during the IRT analysis can be found in Table 7-2. The number of cycles required fell within acceptable ranges.

Table 7-2. 2017-18 eMPowerME: Number of Newton Cycles
Required for Convergence

| Content Area | Grade | Cycles |
| :---: | :---: | :---: |
| Mathematics | Grade 3 | 48 |
|  | Grade 4 | 54 |
|  | Grade 5 | 66 |
|  | Grade 6 | 53 |
|  | Grade 7 | 66 |
|  | Grade 8 | 64 |
| ELA | Grade 3 | 119 |
|  | Grade 4 | 48 |
|  | Grade 5 | 37 |
|  | Grade 6 | 43 |
|  | Grade 7 | 42 |
|  | Grade 8 | 37 |

### 7.3 Equating

The purpose of equating is to ensure that scores obtained from different forms of a test are equivalent to each other. Equating may be used if multiple test forms are administered in the same year, and also to equate one year's forms to those given in the previous year. Equating ensures that students are not given an unfair advantage or disadvantage because the test form they took is easier or harder than those taken by other students.

The 2017-18 administration of the eMPowerME tests used a raw score-to-theta equating procedure in which test forms were equated to the theta scale established on the reference form (i.e., the form used in the most recent standard setting). This is accomplished through the chained linking design, in which every new form is equated back to the theta scale of the previous year's test form. It can therefore be assumed that the theta scale of every new test form is the same as the theta scale of the reference form, since this is where the chain originated.

The groups of students who took the equating items on the 2017-18 eMPowerME tests are not equivalent to the groups who took them in the reference years. IRT is particularly useful for equating scenarios that involve nonequivalent groups (Allen \& Yen, 1979). Equating for eMPowerME uses the anchor-test-nonequivalent-groups design described by Petersen, Kolen, and Hoover (1989). In this equating design, no assumption is made about the equivalence of the examinee groups taking different test forms (that is, naturally occurring groups are assumed). Comparability is instead evaluated by utilizing a set of anchor items (also called equating items). However, the equating items are designed to mirror the common test in terms of item types and distribution of emphasis. Subsets of the equating items are distributed across forms.

Item parameter estimates for the 2017-18 eMPowerME tests were placed on the 2016-17 scale by using the method of Stocking and Lord (1983), which is based on the IRT principle of item parameter
invariance. According to this principle, the equating items for both the 2016-17 and 2017-18 eMPowerME tests should have the same item parameters. After the item parameters for each 2017-18 test were estimated using PARSCALE (Muraki \& Bock, 2003), the Stocking and Lord method was employed to find the linear transformation (slope and intercept) that adjusted the equating items' parameter estimates so that the 2017-18 eMPowerME tests' TCC for the equating items was as close as possible to that of the 2016-17eMPowerME tests.

### 7.4 Equating Results

Prior to calculating the Stocking and Lord transformation constants, a variety of evaluations of the equating items were conducted. Equating items that were flagged for evaluation as a result of these procedures are listed in the Table 7-1. These items were scrutinized, and a decision was made as to whether to include the item as an equating item or to discard it. The procedures used to evaluate the equating items are described below.

Appendix L presents the results from the delta analysis and the rescore analysis. The delta procedure was used to evaluate adequacy of equating items; the discard status presented in the appendix indicates whether the item was flagged as potentially inappropriate for use in equating. With the rescore analysis, 200 random papers from the previous year were interspersed with this year's papers to evaluate scorer consistency from one year to the next. All effect sizes were well below 0.50 in absolute value, the criterion value for excluding an item as an equating item.

Finally, $\alpha$-plots and $b$-plots, which show the IRT parameters for 2017-18 equating items plotted against their previous values, are presented in Appendix M. Any items that appeared as outliers in the plots were evaluated in terms of suitability for use as equating items.

Once all evaluations of the equating items were complete, the Stocking and Lord method of equating was used to place the item parameters onto the previous year's scale, as described above. The Stocking and Lord transformation constants are presented in Table 7-3.

Table 7-3. 2017-18 eMPowerME: Stocking and Lord Transformation Constants

| Content Area | Grade | $\alpha$-slope | $b$-intercept |
| :---: | :---: | :---: | :---: |
|  | 3 | 1.01 | -0.07 |
| Mathematics | 4 | 1.00 | 0.01 |
|  | 5 | 1.02 | -0.01 |
|  | 6 | 1.03 | -0.13 |
|  | 7 | 1.01 | -0.04 |
|  | 8 | 0.93 | 0.09 |
|  | 3 | 0.93 | 0.00 |
| ELA | 4 | 0.98 | 0.08 |
|  | 5 | 1.00 | 0.08 |
|  | 6 | 1.03 | 0.08 |
|  | 7 | 1.03 | 0.16 |
|  | 8 | 0.96 | 0.22 |

### 7.5 Achievement Standards

The eMPowerME standards to establish achievement-level cut scores in ELA and mathematics for grades 3-8 were set in August 2016. Details of the standard-setting procedures can be found in the eMPowerME ELA/Literacy and Mathematics Assessment Standard Setting Report (Measured Progress, 2016).

The cuts on the theta scale that were established via standard setting are presented in Table 7-4. Also shown in the table are the cutpoints on the reporting score scale (described below). These cutpoints will remain fixed throughout the assessment program unless standards are reset for any reason.

Table 7-4. 2017-18 eMPowerME ELA \& Mathematics: Cutpoints on the Theta Metric and Reporting Scale by Content Area and Grade

| Content Area | Grade | Theta |  |  | Scaled Score |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Cut 1 | Cut 2 | Cut 3 | Minimum | Cut 1 | Cut 2 | Cut 3 | Maximum |
| Mathematics | 3 | -0.76 | 0.10 | 1.33 | 300 | 347 | 360 | 378 | 390 |
|  | 4 | -0.78 | 0.25 | 1.28 | 400 | 445 | 460 | 475 | 490 |
|  | 5 | -0.78 | 0.42 | 1.35 | 500 | 544 | 560 | 573 | 590 |
|  | 6 | -0.58 | 0.42 | 1.23 | 600 | 646 | 660 | 671 | 690 |
|  | 7 | -0.63 | 0.33 | 1.35 | 700 | 747 | 760 | 774 | 790 |
|  | 8 | -0.41 | 0.41 | 1.22 | 800 | 849 | 860 | 871 | 890 |
| ELA | 3 | -0.79 | 0.07 | 0.85 | 300 | 347 | 360 | 371 | 390 |
|  | 4 | -0.75 | -0.02 | 0.91 | 400 | 449 | 460 | 474 | 490 |
|  | 5 | -0.78 | -0.03 | 1.05 | 500 | 549 | 560 | 576 | 590 |
|  | 6 | -1.00 | 0.10 | 1.12 | 600 | 644 | 660 | 675 | 690 |
|  | 7 | -0.91 | 0.09 | 1.18 | 700 | 745 | 760 | 776 | 790 |
|  | 8 | -1.03 | 0.06 | 1.27 | 800 | 844 | 860 | 878 | 890 |

### 7.5.1 ELA Cut Score Verification and Review

In 2018, Measured Progress and the Maine DOE undertook a process to review the ELA cut scores. The cut score review, a common practice in state assessment programs, was necessary because the essay prompt was added to the 2017-18 eMPowerME ELA spring assessment, and the eMPowerME ELA scale was established in 2016 without any essay prompts. That original scale included items from only the reading, and writing and language components of eMPowerME. Adding the essay portion to the scale enhances the information eMPowerME provides about student achievement in ELA. It also raises the question of whether the existing ELA cut scores are appropriate for the essay-prompt enhanced ELA scale. The goal of the cut score review was to recommend a set of cut scores that would enable valid interpretations of the essay-prompt enhanced ELA scale, using the eMPowerME achievement level descriptors that were also enhanced to address the inclusion of the essay portion of the assessment.

On June 13 and 15, 2018, the eMPowerME Cut Score Review Panel worked with Measured Progress psychometric, content, scoring, and program management staff to review the existing eMPowerME ELA cut scores and determine whether adjustments were necessary and warranted. The panel was comprised of four

ELA and writing experts from the Maine DOE. Two panel members were ELA specialists, a third was an early learning team coordinator, and a fourth was a K-3 literacy specialist.

The job of the panelists was to (1) follow a set of systematic procedures and discussion rules for reviewing the locations of the essay prompt scores (i.e., scores of $0,1,2,3$, and 4 , as defined by the multi-trait essay scoring rubric) in relation to the achievement level cut scores, (2) make a group recommendation to the DOE regarding the current cut scores and any necessary adjustments, and (c) provide content-based and other rationales for the recommendation to retain or adjust the current cut scores.

Measured Progress psychometric experts, with assistance from content experts, trained the panelists on the cut score review process. In round 1 , the panelists reviewed the essay prompt locations on the enhanced ELA scale and discussed their initial, independent judgments about the cut scores. They developed consensus recommendations in round 2. Measured Progress staff developed all materials for the review process and facilitated the review and recommendations process.

The Cut Score Review panel recognized that, in most cases, specific essay threshold locations, especially thresholds 2 and 3, did not align with the ALDs and the corresponding writing standards. The panel attempted to adjust cut scores in grades 3-8 in order to align the essay threshold locations with ALDs, but this often resulted in too much change to the overall performance data.

Accordingly, the panel recommended retaining the current ELA cut scores and conducting future studies that examine the appropriateness of the assessment methodology, especially at grades 3 and 4 , for the effects of writing digitally, effects of online presentation of paired passages, and quality of the prompts.

The panel also recommended annual monitoring of student performance on the essay. Based on results of that monitoring, the panel recommended a follow-up cut score review in the future, once writing instruction and student proficiency have matured. The purpose of a future cut score review would be to determine if cut scores should be adjusted to retain the interpretability of the ELA achievement level descriptors, or if a new standard setting is appropriate.

### 7.6 Reported Scaled Scores

Because the $\theta$ scale used in IRT calibrations is not readily understood by most stakeholders, reporting scales were developed for eMPowerME. The reporting scales are simple linear transformations of the underlying $\theta$ scale. The reporting scales are developed such that they range from $x 00$ through $x 90$ (where $x$ is grade level). In other words, grade 3 scaled scores ranged from 300 to 390 , grade 4 from 400 through 490, and so forth through grade 8 , where scores ranged from 800 through 890 . The lowest scaled score in the At State Expectations range is fixed at $x 60$ for each grade level. For example, to be classified in the At State Expectations achievement level or above, a minimum scaled score of 360 was required at grade 3, 460 at grade 4, and so forth.

By providing information that is more specific about the position of a student's results, scaled scores supplement achievement-level scores. School- and district-level scaled scores are calculated by computing the
average of student-level scaled scores. Students' raw scores (i.e., total number of points) on the 2017-18 eMPowerME tests were translated to scaled scores using a data analysis process called scaling. Scaling simply converts from one scale to another scale. In the same way that a given temperature can be expressed on either Fahrenheit or Celsius scales, or the same distance can be expressed in either miles or kilometers, student scores on the 2017-18 eMPowerME tests can be expressed in raw or scaled scores.

It is important to note that converting from raw scores to scaled scores does not change students' achievement-level classifications. Given the relative simplicity of raw scores, it is fair to question why scaled scores for eMPowerME are reported instead of raw scores. Scaled scores make the reporting of results consistent. To illustrate, standard setting typically results in different raw cut scores across grades and content areas. The raw cut score between Below State Expectations and At State Expectations could be, say, 35 in mathematics and 33 in ELA, yet both raw scores would be transformed to scaled scores of $x 60$. It is this uniformity across scaled scores that facilitates the understanding of student performance. The psychometric advantage of scaled scores over raw scores comes from their being linear transformations of $\theta$. Since the $\theta$ scale is used for equating, scaled scores are comparable from one year to the next. Raw scores are not.

The scaled scores are obtained by a simple translation of ability estimates $(\hat{\theta})$ using the linear relationship between threshold values on the $\theta$ metric and their equivalent values on the scaled score metric. Students' ability estimates are based on their raw scores and are found by mapping through the TCC. Scaled scores are calculated using the linear equation:

$$
S S=m \hat{\theta}+b
$$

where
$m$ is the slope, and
$b$ is the intercept.
A separate linear transformation is used for each grade and content area combination. For eMPowerME, the transformation function is determined by fixing the Below State Expectations / At State Expectations cut score and the bottom of the scale-that is, the $x 60$ and the $x 00$ values (e.g., 460 and 400 for grade 4). The $x 00$ location on the $\theta$ scale is beyond (i.e., below) the scaling of all items. To determine this location, a chance score (approximately equal to a student's expected performance by guessing) is mapped to a value of -4.0 on the $\theta$ scale. A raw score of 0 is also assigned a scaled score of $x 00$. The maximum possible raw score is assigned a scaled score of $x 90$ (e.g., 490 in the case of grade 4). Because only two points within the $\theta$ scaled score space are fixed, the scaled score cutpoints between Well Below State Expectations and Below State Expectations and between At State Expectations and Above State Expectations can vary across the grade and content area combinations.

Table 7-5 shows the slope and intercept terms used to calculate the scaled scores for each content area and grade. Note that the values in Table 7-5 will not change unless the standards are reset.

Table 7-5. 2017-18 eMPowerME: Scaled Score Slope and Intercept by Content Area and Grade

| Content Area | Grade | Slope | Intercept |
| :---: | :---: | :---: | :---: |
|  | 3 | 14.62345 | 358.4938 |
|  | 4 | 14.12429 | 456.4972 |
| Mathematics | 5 | 13.58696 | 554.3478 |
|  | 6 | 13.58696 | 654.3478 |
|  | 7 | 13.85042 | 755.4017 |
|  | 8 | 13.61779 | 854.4712 |
|  | 3 | 14.73839 | 358.9536 |
|  | 4 | 15.05646 | 460.2258 |
| ELA | 5 | 15.09434 | 560.3774 |
|  | 6 | 14.63415 | 658.5366 |
|  | 7 | 14.68788 | 758.7515 |
|  | 8 | 14.78925 | 859.157 |

Appendix N contains raw score to scaled score look-up tables for the 2017-18 eMPowerME tests. These are the actual tables used to determine student scaled scores, error bands, and achievement levels.

Appendix O contains scaled score distribution graphs for each grade and content area. These distributions were calculated using the sparse data matrix files that were used in the IRT calibrations.

## CHAPTER 8 RELIABILITY

Although an individual item's performance is an important focus for evaluation, a complete evaluation of an assessment must also address the way items function together and complement one another. Tests that function well provide a dependable assessment of the student's level of ability. Unfortunately, no test can do this perfectly. A variety of factors can contribute to a given student's score being either higher or lower than his or her true ability. For example, a student may misread an item, or mistakenly fill in the wrong bubble when he or she knew the answer. Collectively, extraneous factors that affect a student's score are referred to as "measurement error." Any assessment includes some amount of measurement error; that is, no measurement is perfect. This is true of all academic assessments-some students will receive scores that underestimate their true ability, and other students will receive scores that overestimate their true ability. When tests have a high amount of measurement error, student scores are very unstable. Students with high ability may get low scores, or vice versa. Consequently, one cannot reliably measure a student's true level of ability with such a test. Assessments that have less measurement error (i.e., errors made are small on average and student scores on such a test will consistently represent their ability) are described as reliable.

There are a number of ways to estimate an assessment's reliability. One possible approach is to give the same test to the same students at two different points in time. If students receive the same scores on each test, the extraneous factors affecting performance are small and the test is reliable. (This is referred to as "testretest reliability.") A potential problem with this approach is that students may remember items from the first administration or may have gained (or lost) knowledge or skills in the interim between the two administrations. A solution to the remembering items problem is to give a different but parallel test at the second administration. If student scores on each test correlate highly, the test is considered reliable. (This is known as "alternate forms reliability," because an alternate form of the test is used in each administration.) This approach, however, does not address the problem that students may have gained (or lost) knowledge or skills in the interim between the two administrations. In addition, the practical challenges of developing and administering parallel forms generally preclude the use of parallel forms reliability indices. One way to address the latter two problems is to split the test in half and then correlate students' scores on the two halftests; this in effect treats each half-test as a complete test. By doing this, the problems associated with an intervening time interval and with creating and administering two parallel forms of the test are alleviated. This is known as a "split-half estimate of reliability." If the two half-test scores correlate highly, items on the two half-tests must be measuring very similar knowledge or skills. This is evidence that the items complement one another and function well as a group. This also suggests that measurement error will be minimal.

The split-half method requires psychometricians to select items that contribute to each half-test score. This decision may have an impact on the resulting correlation, since each different possible split of the test into halves will result in a different correlation. Another problem with the split-half method of calculating
reliability is that it underestimates reliability, because test length is cut in half. All else being equal, a shorter test is less reliable than a longer test. Cronbach (1951) provided a statistic, $\alpha$ (alpha),that eliminates the problem of the split-half method by comparing individual item variances to total test variance. Cronbach's $\alpha$ was used to assess the reliability of the 2017-18 eMPowerME tests:

$$
\alpha \equiv \frac{n}{n-1}\left[1-\frac{\sum_{i=1}^{n} \sigma_{\left(Y_{i}\right)}^{2}}{\sigma_{x}^{2}}\right],
$$

where
$i$ indexes the item,
$n$ is the total number of items,
$\left.\sigma_{\left(Y_{i}\right)}^{2}\right)$ represents individual item variance, and
$\sigma_{x}^{2}$ represents the total test variance.

### 8.1 Reliability and Standard Errors of Measurement

Table 8-1 presents descriptive statistics, Cronbach's $\alpha$ coefficient, and the raw score standard errors of measurement (SEMs) for each grade and content area. (Statistics are based on common items only.) The reliability of a test can also be exhibited in terms of the SEMs. SEMs can facilitate the interpretation of individual scores. With any given observed raw score point, the reasonable limits of the true score for the examinees can be calculated by using the SEMSs. For more detailed description about the use of SEMs, the reader is referred to Gulliksen (1950) or Anastasi and Urbina (1997). SEM was also used to assess the reliability of the 2017-18 eMPowerME tests:

$$
S E M \equiv \sigma_{x} \sqrt{1-\alpha}
$$

where
$\sigma_{x}$ represents the total test standard deviation, and
$\alpha$ represents the reliability coefficient, Cronbach's alpha.

Table 8-1. 2017-18 eMPowerME: Raw Score Descriptive Statistics Cronbach's Alpha, and SEMs by Grade

| Content Area | Grade | Number of Students | Raw Score |  |  | Alpha | SEM |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Maximum | Mean | Standard Deviation |  |  |
| Mathematics | 3 | 25,860 | 65 | 21.35 | 8.96 | 0.88 | 3.06 |
|  | 4 | 25,935 | 65 | 20.04 | 9.18 | 0.89 | 3.10 |
|  | 5 | 26,626 | 65 | 20.34 | 9.16 | 0.88 | 3.18 |
|  | 6 | 26,104 | 67 | 21.66 | 9.02 | 0.86 | 3.33 |
|  | 7 | 26,646 | 67 | 22.35 | 9.61 | 0.89 | 3.17 |
|  | 8 | 26,411 | 67 | 19.47 | 8.82 | 0.87 | 3.22 |
| ELA | 3 | 25,790 | 51 | 29.59 | 11.32 | 0.91 | 3.45 |
|  | 4 | 25,863 | 50 | 31.34 | 11.19 | 0.90 | 3.62 |

| Content Area | Grade | Number of Students | Raw Score |  |  | Alpha | SEM |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Maximum | Mean | Standard Deviation |  |  |
| ELA | 5 | 26,562 | 51 | 32.47 | 11.79 | 0.90 | 3.68 |
|  | 6 | 26,060 | 54 | 32.66 | 11.24 | 0.90 | 3.58 |
|  | 7 | 26,576 | 54 | 31.54 | 11.71 | 0.90 | 3.65 |
|  | 8 | 26,327 | 55 | 34.48 | 11.67 | 0.90 | 3.67 |

Because different grades and content areas have different test designs (e.g., the number of items varies by test), it is inappropriate to make inferences about the quality of one test by comparing its reliability to that of another test from a different grade and/or content area.

### 8.2 Subgroup Reliability

The reliability coefficients discussed in the previous section were based on the overall population of students who took the 2017-18 eMPowerME test. Appendix Q presents reliabilities for various subgroups of interest. Subgroup Cronbach's $\alpha$ s were calculated using the formula defined earlier in this chapter only on the members of the subgroup in question in the computations; values are calculated only for subgroups with 10 or more students.

For several reasons, the results of this section should be interpreted with caution. First, inherent differences between grades and content areas preclude making valid inferences about the quality of a test based on statistical comparisons with other tests. Second, reliabilities are dependent not only on the measurement properties of a test, but also on the statistical distribution of the studied subgroup. For example, it can be readily seen in Appendix $Q$ that subgroup sample sizes may vary considerably, which results in natural variation in reliability coefficients. Or $\alpha$, which is a type of correlation coefficient, may be artificially depressed for subgroups with little variability (Draper \& Smith, 1998). Third, there is no industry standard to interpret the strength of a reliability coefficient, and this is particularly true when the population of interest is a single subgroup.

### 8.3 Subcategory Reliability

Of even more interest are reliabilities for the reporting subcategories within eMPowerME content areas, as described in Chapter 3. Cronbach's $\alpha$ coefficients for subcategories were calculated via the same formula defined previously using just the items of a given subcategory in the computations. Results are presented in Appendix Q. Because results are based on a subset of items rather than the full test, once again, as expected, computed subcategory reliabilities were lower (sometimes substantially so) than overall test reliabilities, and interpretations should take this into account. The subcategory reliabilities were lower than those based on the total test, and approximately to the degree one would expect based on classical test theory.

Qualitative differences between grades and content areas once again preclude valid inferences about the quality of the full test based on statistical comparisons among subcategories.

### 8.4 Interrater Consistency

Chapter 5 of this report describes in detail the processes that were implemented to monitor the quality of the hand-scoring of student responses for constructed-response items. One of these processes was doubleblind scoring: $20 \%$ of student short constructed-responses and $25 \%$ of student extended-responses were randomly selected and scored independently by two different scorers. Results of the double-blind scoring were used during the scoring process to identify scorers who required retraining or other intervention and are presented here as evidence of the reliability of the eMPowerME tests. A summary of the interrater consistency results is presented in Table 8-2. Results in the table are collapsed across the hand-scored items by grade and content area. The table shows the number of score categories, number of included scores, percent exact agreement, percent adjacent agreement, correlation between the first two sets of scores, and percentage of responses that required a third score. This same information is provided at the item level in Appendix Q .

Table 8-2. 2017-18 eMPowerME: Summary of Interrater Consistency Statistics Collapsed Across Items by Grade

| Content Area | Grade | Number of |  |  | Percent |  | Correlation | Percent of Third Scores |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Items | Score Categories | Included Scores | Exact | Adjacent |  |  |
| Mathematics | 3 | 2 | 2 | 5,076 | 95.71 | 4.29 | 0.90 | 0.14 |
|  |  | 4 | 3 | 10,084 | 92.45 | 7.29 | 0.86 | 1.02 |
|  |  | 2 | 5 | 5,008 | 86.38 | 12.00 | 0.92 | 1.92 |
|  | 4 | 2 | 2 | 5,131 | 96.78 | 3.22 | 0.86 | 0.19 |
|  |  | 4 | 3 | 10,393 | 91.50 | 8.10 | 0.86 | 1.61 |
|  |  | 2 | 5 | 5,262 | 83.83 | 13.55 | 0.91 | 2.98 |
|  | 5 | 2 | 2 | 5,211 | 91.10 | 8.90 | 0.79 | 0.08 |
|  |  | 4 | 3 | 10,461 | 87.04 | 12.53 | 0.84 | 1.23 |
|  |  | 2 | 5 | 5,250 | 87.92 | 10.23 | 0.92 | 2.38 |
|  | 6 | 2 | 2 | 5,064 | 98.76 | 1.24 | 0.82 | 0.06 |
|  |  | 4 | 3 | 10,190 | 93.42 | 6.26 | 0.90 | 0.99 |
|  |  | 2 | 5 | 5,126 | 84.26 | 14.20 | 0.94 | 1.91 |
|  | 7 | 2 | 2 | 5,160 | 97.62 | 2.38 | 0.90 | 0.02 |
|  |  | 4 | 3 | 10,436 | 94.13 | 5.73 | 0.90 | 0.80 |
|  |  | 2 | 5 | 5,276 | 83.78 | 14.88 | 0.92 | 1.57 |
|  | 8 | 2 | 2 | 5,151 | 95.30 | 4.70 | 0.78 | 0.68 |
|  |  | 4 | 3 | 10,158 | 85.35 | 14.24 | 0.82 | 0.70 |
|  |  | 2 | 5 | 5,007 | 93.57 | 5.83 | 0.95 | 0.72 |
| ELA | 3 | 1 | 3 | 2,506 | 65.08 | 33.96 | 0.45 | 0.96 |
|  |  | 3 | 4 | 7,014 | 77.32 | 21.97 | 0.69 | 0.71 |
|  |  | 4 | 5 | 9,864 | 64.84 | 34.06 | 0.56 | 10.67 |
|  | 4 | 2 | 3 | 4,514 | 78.02 | 21.36 | 0.76 | 0.53 |
|  |  | 2 | 4 | 5,011 | 74.92 | 24.01 | 0.70 | 1.06 |
|  |  | 4 | 5 | 7,140 | 57.00 | 40.38 | 0.54 | 15.74 |
|  | 5 | 2 | 3 | 5,133 | 74.81 | 24.90 | 0.71 | 0.31 |
|  |  | 2 | 4 | 5,117 | 72.99 | 26.34 | 0.83 | 0.64 |
|  |  | 4 | 5 | 9,732 | 64.03 | 34.83 | 0.61 | 16.28 |

| Content Area | Grade | Number of |  |  | Percent |  | Correlation | Percent of Third Scores |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Items | Score Categories | Included Scores | Exact | Adjacent |  |  |
| ELA | 6 | 2 | 3 | 4,974 | 70.18 | 28.51 | 0.62 | 1.31 |
|  | 6 | 6 | 5 | 15,662 | 53.94 | 40.86 | 0.64 | 13.08 |
|  | 7 | 2 | 3 | 5,027 | 74.28 | 24.95 | 0.69 | 0.78 |
|  | 7 | 6 | 5 | 18,039 | 59.54 | 37.92 | 0.73 | 14.48 |
|  | 8 | 2 | 3 | 4,923 | 76.70 | 23.12 | 0.70 | 0.18 |
|  | 9 | 6 | 5 | 16,410 | 64.56 | 34.29 | 0.78 | 6.76 |

### 8.5 Reliability of Achievement-Level Categorization

While related to reliability, the accuracy and consistency of classifying students into achievement categories are even more important statistics in a standards-based reporting framework (Livingston \& Lewis, 1995). After the achievement levels were specified and students were classified into those levels, empirical analyses were conducted to determine the statistical accuracy and consistency of the classifications. For eMPowerME, students are classified into one of four achievement levels: Well Below State Expectations, Below State Expectations, At State Expectations, or Above State Expectations. (See Appendix R for the achievement level score distributions.) This section of the report explains the methodologies used to assess the reliability of classification decisions, and results are given.

Accuracy refers to the extent to which decisions based on test scores match decisions that would have been made if the scores did not contain any measurement error. Accuracy must be estimated, because errorless test scores do not exist. Consistency measures the extent to which classification decisions based on test scores match the decisions based on scores from a second, parallel form of the same test. Consistency can be evaluated directly from actual responses to test items if two complete and parallel forms of the test are given to the same group of students. In operational test programs, however, such a design is usually impractical. Instead, techniques have been developed to estimate both the accuracy and consistency of classification decisions based on a single administration of a test. The Livingston and Lewis (1995) technique was used for the 2016-17 eMPowerME tests because it is easily adaptable to all types of testing formats, including mixed-format tests.

The accuracy and consistency estimates reported in Appendix S make use of "true scores" in the classical test theory sense. A true score is the score that would be obtained if a test had no measurement error. Of course, true scores cannot be observed and so must be estimated. In the Livingston and Lewis (1995) method, estimated true scores are used to categorize students into their "true" classifications.

For the 2017-18 eMPowerME tests, after various technical adjustments (described in Livingston \& Lewis, 1995), a four-by-four contingency table of accuracy was created for each grade and content area, where cell $[i, j]$ represented the estimated proportion of students whose true score fell into classification $i$
(where $i=1$ to 4 ) and observed score into classification $j$ (where $j=1$ to 4 ). The sum of the diagonal entries (i.e., the proportion of students whose true and observed classifications matched) signified overall accuracy.

To calculate consistency, true scores were used to estimate the joint distribution of classifications on two independent, parallel test forms. Following statistical adjustments per Livingston and Lewis (1995), a new four-by-four contingency table was created for each grade and content area and populated by the proportion of students who would be categorized into each combination of classifications according to the two (hypothetical) parallel test forms. Cell $[i, j]$ of this table represented the estimated proportion of students whose observed score on the first form would fall into classification $i$ (where $i=1$ to 4 ) and whose observed score on the second form would fall into classification $j$ (where $j=1$ to 4 ). The sum of the diagonal entries (i.e., the proportion of students categorized by the two forms into exactly the same classification) signified overall consistency.

Another way to measure consistency is to use Cohen's (1960) coefficient $\kappa$ (kappa), which assesses the proportion of consistent classifications after removing the proportion of consistent classifications that would be expected by chance. It is calculated using the following formula:

$$
\kappa=\frac{(\text { Observed agreement })-(\text { Chance agreement })}{1-(\text { Chance agreement })}=\frac{\sum_{i} C_{i i}-\sum_{i} C_{i .} C_{i}}{1-\sum_{i} C_{i .} C_{i}},
$$

where
$C_{i .}$ is the proportion of students whose observed achievement level would be Level $i$ (where $i=1-4$ ) on the first hypothetical parallel form of the test;
$C_{. i}$ is the proportion of students whose observed achievement level would be Level $i$ (where $i=1-4$ ) on the second hypothetical parallel form of the test; and
$C_{i i}$ is the proportion of students whose observed achievement level would be Level $i$ (where $i=1-4$ ) on both hypothetical parallel forms of the test.

Because $\kappa$ is corrected for chance, its values are lower than are other consistency estimates.

### 8.5.1 Accuracy and Consistency

The accuracy and consistency analyses described above are provided in Table S-1 of Appendix S. The table includes overall accuracy and consistency indices, including kappa. Accuracy and consistency values conditional on achievement level are also given. For these calculations, the denominator is the proportion of students associated with a given achievement level. For example, if the conditional accuracy value is 0.85 for any achievement level, this figure indicates that among the students whose true scores placed them in this classification, $85 \%$ would be expected to be in this classification when categorized according to their observed scores. Similarly, a consistency value of 0.80 indicates that $80 \%$ of students with observed scores in any achievement level would be expected to score in this classification again if a second, parallel test form were used.

For some testing situations, the greatest concern may be decisions around level thresholds. For example, in testing done for Elementary and Secondary Education Act (ESEA) accountability purposes, the
primary concern is distinguishing between students who are proficient and those who are not yet proficient. In this case, the accuracy of the Below State Expectations-At State Expectations threshold is of greatest interest. For the 2017-18 eMPowerME tests, Table S-2 in Appendix S provides accuracy and consistency estimates at each cutpoint as well as false positive and false negative decision rates. (A false positive is the proportion of students whose observed scores were above the cutpoint and whose true scores were below the cutpoint. A false negative is the proportion of students whose observed scores were below the cutpoint and whose true scores were above the cutpoint.)

Note that, as with other methods of evaluating reliability, accuracy, and consistency, statistics calculated based on small groups can be expected to be lower than those calculated based on larger groups. For this reason, the values presented in Appendix $S$ should be interpreted with caution. In addition, it is important to remember that it is inappropriate to compare accuracy and consistency statistics between grades and content areas.

## CHAPTER 9 VALIDITY

Because interpretations of test scores, and not a test itself, are evaluated for validity, the purpose of the 2017-18 eMPowerME Technical Report is to describe several technical aspects of the eMPowerME tests in support of score interpretations. Each chapter is an important component in the investigation of score validation: test development and design; test administration; scoring, scaling, and equating; item analyses; reliability; and score reporting.

The Standards for Educational and Psychological Testing (AERA et al., 2014) provides a framework for describing sources of evidence that should be considered when constructing a validity argument. The evidence around test content, response processes, internal structure, relationship to other variables, and consequences of testing speaks to different aspects of validity, but those aspects are not distinct types of validity. Instead, each aspect of validity contributes to a body of evidence about the comprehensive validity of score interpretations.

Evidence on test content validity is meant to determine how well the assessment tasks represent the curriculum and standards for each grade level and content area. Content validation is informed by the item development process, including how the test blueprints and test items align to the curriculum and standards. (See Appendix B for the comprehensive set of test blueprints.) Viewed through this lens provided by the standards, evidence based on test content was extensively described in Chapters 3 and 4. Item alignment with Maine's academic content standards; item bias, sensitivity, and content appropriateness review processes; adherence to the test blueprint; use of multiple item types; use of standardized administration procedures with accommodated options for participation; and appropriate test administration training are all components of validity evidence based on test content. As discussed earlier, all eMPowerME questions were reviewed for alignment to specific Maine's academic content standards by educators from Maine who participated in the Item Review Committees. The items also underwent several rounds of review for content fidelity and appropriateness. Items are presented to students in multiple formats (constructed-response, short-answer, multiple-choice, and evidence-based selected-response). Finally, tests are administered according to statemandated standardized procedures, with allowable accommodations, and all test coordinators and administrators are required to familiarize themselves with and adhere to all the procedures outlined in the School Test Coordinator Manual and the Test Administration Manual. These documents may be accessed on the eMPower Maine Help and Support Website at: https://maine.onlinehelp.measuredprogress.org/testingmaterials/

The scoring information in Chapter 5 describes the steps taken to train and monitor hand-scorers, as well as quality-control procedures related to scanning and machine scoring.

Evidence based on internal structure is presented in great detail in the discussions of item analyses, scaling and equating, and reliability in Chapters 6 through 8 . Technical characteristics of the internal structure
of the assessments are presented in terms of classical item statistics (e.g., item difficulty, item-test correlation), differential item functioning (DIF) analyses, dimensionality analyses, reliability, standard error of measurement (SEM), and item response theory (IRT) parameters and procedures. Each test is equated to the same grade and content area test from the prior year in order to preserve the meaning of scores over time. In general, item difficulty and discrimination indices were in acceptable and expected ranges. Very few items were answered correctly at near-chance or near-perfect rates. Similarly, the positive discrimination indices indicate that most items were assessing consistent constructs, and students who performed well on individual items tended to perform well overall.

Evidence based on the consequences of testing is addressed in the scaled score information in Chapter 7. Scaled scores offer the advantage of simplifying the reporting of results across content areas, grade levels, and subsequent years. Achievement levels provide users with reference points for mastery at each grade and content area, which is another useful and simple way to interpret scores. Several different standard reports are provided to stakeholders. Additional evidence of the consequences of testing could be supplemented with broader investigation of the effect of testing on student learning.

To further support the validation of the assessment program, additional studies might be considered to provide evidence regarding the relationship of eMPowerME results to other variables, including the extent to which scores from eMPowerME converge with other measures of similar constructs, and the extent to which they diverge from measures of different constructs. Relationships among measures of the same or similar constructs can sharpen the meaning of scores and appropriate interpretations by refining the definition of the construct.

## APPENDICES

## APPENDIX A—CONTENT STANDARDS

Table A-1. 2016-17 eMPowerME: Reading Standards- Grade 3

| Grade 3 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard T ext |
| RL | K ey Ideas and Details | RL.3.1 | A sk and answer questions to demonstrate understanding of a text, referring explicitly to the text as the basis for the answers. |
|  |  | RL.3.2 | Recount stories, including fables, folktales, and myths from diverse cultures; determine the central message, lesson, or moral and explain how it is conveyed through key details in the text. |
|  |  | RL.3.3 | Describe characters in a story (e.g., their traits, motivations, or feelings) and explain how their actions contribute to the sequence of events. |
|  | Craft and Structure | RL. 3.4 | Determine the meaning of words and phrases as they are used in a text, distinguishing literal from nonliteral language. |
|  |  | RL. 3.5 | Refer to parts of stories, dramas, and poems when writing or speaking about a text, using terms such as chapter, scene, and stanza; describe how each successive part builds on earlier sections. |
|  |  | RL.3.6 | Distinguish their own point of view from that of the narrator or those of the characters. |
|  | Integration of K now ledge and Ideas | RL.3.7 | Explain how specific aspects of a text's illustrations contribute to what is conveyed by the words in a story (e.g., create mood, emphasize aspects of a character or setting). |
|  |  | RL.3.9 | Compare and contrast the themes, settings, and plots of stories written by the same author about the same or similar characters (e.g., in books from a series). |
| RI | K ey Ideas and Details | RI.3.1 | A sk and answer questions to demonstrate understanding of a text, referring explicitly to the text as the basis for the answers. |
|  |  | RI.3.2 | Determine the main idea of a text; recount the key details and explain how they support the main idea. |
|  |  | RI.3.3 | Describe the relationship between a series of historical events, scientific ideas or concepts, or steps in technical procedures in a text, using I anguage that pertains to time, sequence, and cause/effect. |
| RI | Craft and Structure | RI.3.4 | Determine the meaning of general academic and domain-specific words and phrases in a text relevant to a grade 3 topic or subject area. |

|  |  | G rade 3 |  |
| :--- | :--- | :--- | :--- |
| Domain | Anchor <br> Standard | Standard | Standard T ext |
|  |  | RI.3.5 | Use text features and search tools (e.g., key words, sidebars, hyperlinks) <br> to locate information relevant to a given topic efficiently. |
|  |  | RI.3.6 | Distinguish their own point of view from that of the author of a text. |

Table A-2. 2016-17 eMPowerME: Reading Standards- Grade 4

| Grade 4 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard Text |
| RL | Key Ideas and Details | RL.4.1 | Refer to details and examples in a text when explaining what the text says explicitly and when drawing inferences from the text. |
|  |  | RL.4.2 | Determine a theme of a story, drama, or poem from details in the text; summarize the text. |
|  |  | RL.4.3 | Describe in depth a character, setting, or event in a story or drama, drawing on specific details in the text (e.g., a character's thoughts, words, or actions). |
|  | Craft and Structure | RL.4.4 | Determine the meaning of words and phrases as they are used in a text, including those that allude to significant characters found in mythology (e.g., Herculean). |
|  |  | RL.4.5 | Explain major differences between poems, drama, and prose, and refer to the structural elements of poems (e.g., verse, rhythm, meter) and drama (e.g., casts of characters, settings, descriptions, dialogue, stage directions) when writing or speaking about a text. |
|  |  | RL.4.6 | Compare and contrast the point of view from which different stories are narrated, including the difference between first- and third-person narrations. |
|  | Integration of K nowledge and Ideas | RL.4.7 | M ake connections between the text of a story or drama and a visual or oral presentation of the text, identifying where each version reflects specific descriptions and directions in the text. |
|  |  | RL.4.9 | Compare and contrast the treatment of similar themes and topics (e.g., opposition of good and evil) and patterns of events (e.g., the quest) in stories, myths, and traditional literature from different cultures. |
| RI | K ey Ideas and Details | RI.4.1 | Refer to details and examples in a text when explaining what the text says explicitly and when drawing inferences from the text. |
|  |  | RI.4.2 | Determine the main idea of a text and explain how it is supported by key details; summarize the text. |
|  |  | RI.4.3 | Explain events, procedures, ideas, or concepts in a historical, scientific, or technical text, including what happened and why, based on specific information in the text. |
| RI | Craft and Structure | RI.4.4 | Determine the meaning of general academic and domain-specific words or phrases in a text relevant to a grade 4 topic or subject area. <br> continued |

| Grade 4 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard T ext |
|  |  | RI.4.5 | Describe the overall structure (e.g., chronology, comparison, cause/effect, problem/solution) of events, ideas, concepts, or information in a text or part of a text. |
|  |  | RI.4.6 | Compare and contrast a firsthand and secondhand account of the same event or topic; describe the differences in focus and the information provided. |
|  | Integration of K nowledge and Ideas | RI.4.7 | Interpret information presented visually, orally, or quantitatively (e.g., in charts, graphs, diagrams, time lines, animations, or interactive elements on W eb pages) and explain how the information contributes to an understanding of the text in which it appears. |
|  |  | RI.4.8 | Explain how an author uses reasons and evidence to support particular points in a text. |
|  |  | RI.4.9 | Integrate information from two texts on the same topic in order to write or speak about the subject knowledgeably. |

Table A-3. 2016-17 eMPowerME: Reading Standards- Grade 5

| Grade 5 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard Text |
| RL | K ey Ideas and Details | RL.5.1 | Quote accurately from a text when explaining what the text says explicitly and when drawing inferences from the text. |
|  |  | RL.5.2 | Determine a theme of a story, drama, or poem from details in the text, including how characters in a story or drama respond to challenges or how the speaker in a poem reflects upon a topic; summarize the text. |
|  |  | RL.5.3 | Compare and contrast two or more characters, settings, or events in a story or drama, drawing on specific details in the text (e.g., how characters interact). |
|  | Craft and Structure | RL. 5.4 | Determine the meaning of words and phrases as they are used in a text, including figurative language such as metaphors and similes. |
|  |  | RL. 5.5 | Explain how a series of chapters, scenes, or stanzas fits together to provide the overall structure of a particular story, drama, or poem. |
|  |  | RL.5.6 | Describe how a narrator's or speaker's point of view influences how events are described. |
|  | Integration of K nowledge and Ideas | RL.5.7 | A nalyze how visual and multimedia elements contribute to the meaning, tone, or beauty of a text (e.g., graphic novel, multimedia presentation of fiction, folktale, myth, poem). |
|  |  | RL.5.9 | Compare and contrast stories in the same genre (e.g., mysteries and adventure stories) on their approaches to similar themes and topics. |
| RI | K ey Ideas and Details | RI.5.1 | Quote accurately from a text when explaining what the text says explicitly and when drawing inferences from the text. |
|  |  | RI.5.2 | Determine two or more main ideas of a text and explain how they are supported by key details; summarize the text. |
|  |  | RI.5.3 | Explain the relationships or interactions between two or more individuals, events, ideas, or concepts in a historical, scientific, or technical text based on specific information in the text. |
| RI | Craft and Structure | RI.5.4 | Determine the meaning of general academic and domain-specific words and phrases in a text rel evant to a grade 5 topic or subject area. <br> continued |

|  |  | RI.6.5 | A nalyze how a particular sentence, paragraph, chapter, or section fits into the overall structure of a text and contributes to the development of the ideas. |
|  |  | RI.6.6 | Determine an author's point of view or purpose in a text and explain how it is conveyed in the text. |
|  | Integration of K nowledge and Ideas | RI.6.7 | Integrate information presented in different media or formats (e.g., visually, quantitatively) as well as in words to develop a coherent understanding of a topic or issue. |
|  |  | RI. 6.8 | Trace and evaluate the argument and specific claims in a text, distinguishing claims that are supported by reasons and evidence from claims that are not. |
|  |  | RI.6.9 | Compare and contrast one author's presentation of events with that of another (e.g., a memoir written by and a biography on the same person). |

Table A-5. 2016-17 eMPowerME: Reading Standards- Grade 7

## Grade 7

| Domain | Anchor <br> Standard | Standard | Standard T ext |
| :--- | :--- | :--- | :--- |
|  |  | RI.7.5 | A nalyze the structure an author uses to organize a text, including how the <br> major sections contribute to the whole and to the development <br> of the ideas. |
|  |  | RI.7.6 | Determine an author's point of view or purpose in a text and analyze how <br> the author distinguishes his or her position from that of others. |
|  |  | RI.7.7 | Integration <br> of <br> Knowledge <br> the text, analyzing each medium's portrayal of the subject (e.g., how the <br> delivery of a speech affects the impact of the words). <br> and Ideas |
|  | RI.7.8 | Trace and evaluate the argument and specific claims in a text, assessing <br> whether the reasoning is sound and the evidence is relevant and <br> sufficient to support the claims. |  |
|  | RI.7.9 | A nalyze how two or more authors writing about the same topic shape <br> their presentations of key information by emphasizing different evidence <br> or advancing different interpretations of facts. |  |

Table A-6. 2016-17 eMPowerME: Reading Standards- Grade 8

| Grade 8 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard Text |
| RL | Key Ideas and Details | RL.8.1 | Cite the textual evidence that most strongly supports an analysis of what the text says explicitly as well as inferences drawn from the text. |
|  |  | RL.8.2 | Determine a theme or central idea of a text and analyze its development over the course of the text, including its relationship to the characters, setting, and plot; provide an objective summary of the text. |
|  |  | RL.8.3 | A nalyze how particular lines of dialogue or incidents in a story or drama propel the action, reveal aspects of a character, or provoke a decision. |
|  | Craft and Structure | RL.8.4 | Determine the meaning of words and phrases as they are used in a text, including figurative and connotative meanings; analyze the impact of specific word choices on meaning and tone, including analogies or allusions to other texts. |
|  |  | RL.8.5 | Compare and contrast the structure of two or more texts and analyze how the differing structure of each text contributes to its meaning and style. |
|  |  | RL.8.6 | A nalyze how differences in the points of view of the characters and the audience or reader (e.g., created through the use of dramatic irony) create such effects as suspense or humor. |
|  | Integration of K nowledge and Ideas | RL.8.7 | A nalyze the extent to which a filmed or live production of a story or drama stays faithful to or departs from the text or script, evaluating the choices made by the director or actors. |
|  |  | RL.8.9 | A nal yze how a modern work of fiction draws on themes, patterns of events, or character types from myths, traditional stories, or religious works such as the Bible, including describing how the material is rendered new. |
| RI | K ey Ideas and Details | RI.8.1 | Cite the textual evidence that most strongly supports an analysis of what the text says explicitly as well as inferences drawn from the text. |
|  |  | RI.8.2 | Determine a central idea of a text and analyze its development over the course of the text, including its relationship to supporting ideas; provide an objective summary of the text. |
|  |  | RI.8.3 | A nalyze how a text makes connections among and distinctions between individuals, ideas, or events (e.g., through comparisons, analogies, or categories). |
| RI | Craft and Structure | RI.8.4 | Determine the meaning of words and phrases as they are used in a text, including figurative, connotative, and technical meanings; analyze the impact of specific word choices on meaning and tone, including analogies or allusions to other texts. |

| G rade 8 |  |  |  |
| :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard Text |
|  |  | RI.8.5 | A nalyze in detail the structure of a specific paragraph in a text, including the role of particular sentences in developing and refining a key concept. |
|  |  | RI.8.6 | Determine an author's point of view or purpose in a text and analyze how the author acknowledges and responds to conflicting evidence or viewpoints. |
|  | Integration of K nowledge and Ideas | RI.8.7 | Evaluate the advantages and disadvantages of using different mediums (e.g., print or digital text, video, multimedia) to present a particular topic or idea. |
|  |  | RI.8.8 | Delineate and evaluate the argument and specific claims in a text, assessing whether the reasoning is sound and the evidence is relevant and sufficient; recognize when irrelevant evidence is introduced. |
|  |  | RI.8.9 | A nalyze a case in which two or more texts provide conflicting information on the same topic and identify where the texts disagree on matters of fact or interpretation. |

Table A-7. 2016-17 eMPowerME: Writing Standards- Grade 3

| Grade 3 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Domain | Anchor Standard | Standard | Standard Text | Objective Text |
|  |  | WR.3.1 | W rite opinion pieces on topics or texts, supporting a point of view with reasons. | a. Introduce the topic or text they are writing about, state an opinion, and create an organizational structure that lists reasons. <br> b. Provide reasons that support the opinion. <br> c. Use linking words and phrases (e.g., because, therefore, since, for example) to connect opinion and reasons. <br> d. Provide a concluding statement or section. |
| WR | Text Types and Purposes | WR.3.2 | W rite informative/explanatory texts to examine a topic and convey ideas and information clearly. | a. Introduce a topic and group related <br> information together; include illustrations when useful to aiding comprehension. <br> b. Develop the topic with facts, definitions, and details. <br> c. Use linking words and phrases (e.g., also, another, and, more, but) to connect ideas within categories of information. <br> d. Provide a concluding statement or section. |

Provide a conclusion that follows from and reflects on the narrated experiences or events. |
| WR | Production and Distribution of Writing | WR.7.4 | Produce clear and coherent writing in which the development, organization, and style are appropriate to task, purpose, and audience. (Grade-specific expectations for writing types are defined in standards 1-3 above.) |  |
|  |  | WR.7.5 | With some guidance and support from peers and adults, develop and strengthen writing as needed by planning, revising, editing, rewriting, or trying a new approach, focusing on how well purpose and audience have been addressed. (Editing for conventions should demonstrate command of L anguage standards 1-3 up to and including grade 7 on page 53.) | continued |

## Grade 7

| Domain | Anchor Standard | Standard | Standard Text | Objective Text |
| :---: | :---: | :---: | :---: | :---: |
|  |  | WR.7.6 | Use technology, including the Internet, to produce and publish writing and link to and cite sources as well as to interact and collaborate with others, including linking to and citing sources. |  |
|  | Research to <br> Build and <br> Present <br> K nowledge | WR.7.7 | Conduct short research projects to answer a question, drawing on several sources and generating additional related, focused questions for further research and investigation. |  |
|  |  | WR.7.8 | Gather relevant information from multiple print and digital sources, using search terms effectively; assess the credibility and accuracy of each source; and quote or paraphrase the data and conclusions of others while avoiding plagiarism and following a standard format for citation. |  |
| WR | Research to <br> Build and <br> Present <br> K nowledge | WR.7.9 | D raw evidence from literary or informational texts to support analysis, reflection, and research. | a. A pply grade 7 R eading standards to literature (e.g., "Compare and contrast a fictional portrayal of a time, place, or character and a historical account of the same period as a means of understanding how authors of fiction use or alter history"). <br> b. A pply grade 7 Reading standards to literary nonfiction (e.g. "Trace and evaluate the argument and specific claims in a text, assessing whether the reasoning is sound and the evidence is relevant and sufficient to support the claims"). |
|  | Range of Writing | WR.7.10 | W rite routinely over extended time frames (time for research, reflection, and revision) and shorter time frames (a single sitting or a day or two) for a range of discipline-specific tasks, purposes, and audiences. | continued |

Table A-13. 2016-17 eMPowerME: Mathematics Standards - Grade 3

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
| Operations \& Algebraic Thinking | Represent and solve problems involving multiplication and division. | Interpret products of whole numbers, e.g., interpret $5 \times 7$ as the total number of objects in 5 groups of 7 objects each. | 03.0A.01.01 |
|  |  | Interpret whole-number quotients of whole numbers, e.g., interpret $56 \div 8$ as the number of objects in each share when 56 objects are partitioned equally into 8 shares, or as a number of shares when 56 objects are partitioned into equal shares of 8 objects each. | 03.0A.01.02 |
|  |  | Use multiplication and division within 100 to solve word problems in situations involving equal groups, arrays, and measurement quantities, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem. | 03.0A.01.03 |
|  | Understand properties of multiplication and the relationship between multiplication and division. | Apply properties of operations as strategies to multiply and divide. | 03.0A.02.05 |
|  |  | Understand division as an unknown-factor problem. | 03.0A.02.06 |
|  | Multiply and divide within 100. | Fluently multiply and divide within 100, using strategies such as the relationship between multiplication and division (e.g., knowing that $8 \times 5=40$, one knows $40 \div 5=$ 8) or properties of operations. By the end of Grade 3, know from memory all products of two one-digit numbers. | 03.0A.03.07 |
|  | Solve problems involving the four operations, and identify and explain patterns in arithmetic. | Solve two-step word problems using the four operations. Represent these problems using equations with a letter standing for the unknown quantity. Assess the reasonableness of answers using mental computation and estimation strategies including rounding. | 03.0A.04.08 |
|  <br> Operations: Base Ten | Use place value understanding and properties of operations to perform multi-digit arithmetic. | Use place value understanding to round whole numbers to the nearest 10 or 100. | 03.NBT. 01.01 |
|  |  | Fluently add and subtract within 1000 using strategies and algorithms based on place value, properties of operations, and/or the relationship between addition and subtraction. | 03.NBT.01.02 |
|  |  | Multiply one-digit whole numbers by multiples of 10 in the range 10-90 (e.g., $9 \times 80,5 \times 60$ ) using strategies based on place value and properties of operations. | 03.NBT.01.03 |
|  <br> Operations: <br> Fractions | Develop understanding of fractions as numbers. | Understand a fraction $1 / b$ as the quantity formed by 1 part when a whole is partitioned into $b$ equal parts; understand a fraction $a / b$ as the quantity formed by $a$ parts of size $1 / b$. | 03.NF.01.01 <br> continued |

|  |  | Represent a fraction $1 / b$ on a number line diagram by defining the interval from 0 to 1 as the whole and partitioning it into $b$ equal parts. Recognize that each part has size $1 / b$ and that the endpoint of the part based at 0 locates the number $\mathbf{1 / b}$ on the number line. | 03.NF.01.02.a |
| :---: | :---: | :---: | :---: |
|  |  | Explain equivalence of fractions in special cases, and compare fractions by reasoning about their size. Understand two fractions as equivalent (equal) if they are the same size, or the same point on a number line. | 03.NF.01.03.a |
|  |  | Express whole numbers as fractions, and recognize fractions that are equivalent to whole numbers. | 03.NF.01.03.c |
|  |  | Compare two fractions with the same numerator or the same denominator by reasoning about their size. Recognize that comparisons are valid only when the two fractions refer to the same whole. Record the results of comparisons with the symbols $>$, $=$, or $<$, and justify the conclusions, e.g., by using a visual fraction model. | 03.NF.01.03.d |
|  |  | Tell and write time to the nearest minute and measure time intervals in minutes. Solve word problems involving addition and subtraction of time intervals in minutes, e.g., by representing the problem on a number line diagram. | 03.MD.01.01 |
|  | Solve problems involving measurement and estimation. | Measure and estimate liquid volumes and masses of objects using standard units of grams (g), kilograms (kg), and liters (I). Add, subtract, multiply, or divide to solve one-step word problems involving masses or volumes that are given in the same units, e.g., by using drawings (such as a beaker with a measurement scale) to represent the problem. | 03.MD.01.02 |
| Measurement \& Data |  | Draw a scaled picture graph and a scaled bar graph to represent a data set with several categories. Solve oneand two-step "how many more" and "how many less" problems using information presented in scaled bar graphs. | 03.MD.02.03 |
|  |  | Generate measurement data by measuring lengths using rulers marked with halves and fourths of an inch. Show the data by making a line plot, where the horizontal scale is marked off in appropriate units- whole numbers, halves, or quarters. | 03.MD.02.04 |
|  |  | Recognize area as an attribute of plane figures and understand concepts of area measurement. | 03.MD.03.05 |
|  | understand concepts of area and relate area to multiplication and to addition. | Relate area to the operations of multiplication and addition. Use tiling to show in a concrete case that the area of a rectangle with whole-number side lengths $a$ and $b+c$ is the sum of $\boldsymbol{a} \times \boldsymbol{b}$ and $\mathrm{a} \times \boldsymbol{c}$. Use area models to represent the distributive property in mathematical reasoning. | 03.MD.03.07.c <br> continued |

|  |  | Relate area to the operations of multiplication and addition. Recognize area as additive. Find areas of rectilinear figures by decomposing them into nonoverlapping rectangles and adding the areas of the nonoverlapping parts, applying this technique to solve real world problems. | 03.MD.03.07.d |
| :---: | :---: | :---: | :---: |
|  | Geometric measurement: recognize perimeter. | Solve real world and mathematical problems involving perimeters of polygons, including finding the perimeter given the side lengths, finding an unknown side length, and exhibiting rectangles with the same perimeter and different areas or with the same area and different perimeters. | 03.MD. 04.08 |
|  |  |  | 03.G.01 |
| Geometry | Reason with shapes and their attributes. | Understand that shapes in different categories (e.g., rhombuses, rectangles, and others) may share attributes (e.g., having four sides), and that the shared attributes can define a larger category (e.g., quadrilaterals). Recognize rhombuses, rectangles, and squares as examples of quadrilaterals, and draw examples of quadrilaterals that do not belong to any of these subcategories. | 03.G.01.01 |
|  |  | Partition shapes into parts with equal areas. Express the area of each part as a unit fraction of the whole. | 03.G.01.02 |

Table A-14. 2016-17 eMPowerME: Mathematics Standards - Grade 4

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
|  <br> Algebraic <br> Thinking | Use the four operations with whole numbers to solve problems. | Interpret a multiplication equation as a comparison, e.g., interpret $35=5 \times 7$ as a statement that 35 is 5 times as many as 7 and 7 times as many as 5 . Represent verbal statements of multiplicative comparisons as multiplication equations. | 04.OA.01.01 |
|  |  | Multiply or divide to solve word problems involving multiplicative comparison, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem, distinguishing multiplicative comparison from additive comparison. | 04.OA.01.02 |
|  |  | Solve multistep word problems posed with whole numbers and having whole-number answers using the four operations, including problems in which remainders must be interpreted. Represent these problems using equations with a letter standing for the unknown quantity. Assess the reasonableness of answers using mental computation and estimation strategies including rounding. | 04.OA.01.03 |
|  | Gain familiarity with factors and multiples. | Find all factor pairs for a whole number in the range $1 \mathbf{1 0 0}$. Recognize that a whole number is a multiple of each of its factors. Determine whether a given whole number in the range $1 \mathbf{1 0 0}$ is a multiple of a given one-digit number. Determine whether a given whole number in the range 1-100 is prime or composite. | 04.OA.02.04 |
|  | Generate and analyze patterns. | Generate a number or shape pattern that follows a given rule. Identify apparent features of the pattern that were not explicit in the rule itself. | 04.OA.03.05 |
| Number \& Operations: Base Ten | Generalize place value understanding for multidigit whole numbers. | Recognize that in a multi-digit whole number, a digit in one place represents ten times what it represents in the place to its right. | 04.NBT.01.01 |
|  |  | Read and write multi-digit whole numbers using base-ten numerals, number names, and expanded form. Compare two multi-digit numbers based on meanings of the digits in each place, using $>,=$, and < symbols to record the results of comparisons. | 04.NBT.01.02 |
|  |  | Use place value understanding to round multidigit whole numbers to any place. | 04.NBT.01.03 |
|  | Use place value understanding and properties of operations to perform multi-digit arithmetic. | Fluently add and subtract multi-digit whole numbers using the standard algorithm. | 04.NBT.02.04 |
|  |  | Multiply a whole number of up to four digits by a one-digit whole number, and multiply two twodigit numbers, using strategies based on place value and the properties of operations. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models. | 04.NBT. 02.05 <br> continued |

|  |  | Find whole-number quotients and remainders with up to four-digit dividends and one-digit divisors, using strategies based on place value, the properties of operations, and/or the relationship between multiplication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models. | 04.NBT.02.06 |
| :---: | :---: | :---: | :---: |
| Number \& Operations: Fractions | Extend understanding of fraction equivalence and ordering. | Explain why a fraction $a / b$ is equivalent to a fraction $(n \times a) /(n \times b)$ by using visual fraction models, with attention to how the number and size of the parts differ even though the two fractions themselves are the same size. Use this principle to recognize and generate equivalent fractions. | 04.NF.01.01 |
|  |  | Compare two fractions with different numerators and different denominators, e.g., by creating common denominators or numerators, or by comparing to a benchmark fraction such as $1 / 2$. Recognize that comparisons are valid only when the two fractions refer to the same whole. Record the results of comparisons with symbols $>$, $=$, or <, and justify the conclusions, e.g., by using a visual fraction model. | 04.NF.01.02 |
|  | Build fractions from unit fractions. | Understand a fraction $a / b$ with $a>1$ as a sum of fractions $1 / b$. | 04.NF.02.03 |
|  |  | Solve word problems involving addition and subtraction of fractions referring to the same whole and having like denominators, e.g., by using visual fraction models and equations to represent the problem. | 04.NF.02.03.d |
|  |  | Solve word problems involving multiplication of a fraction by a whole number, e.g., by using visual fraction models and equations to represent the problem. | 04.NF.02.04.c |
|  | Understand decimal notation for fractions, and compare decimal fractions. | Express a fraction with denominator 10 as an equivalent fraction with denominator 100, and use this technique to add two fractions with respective denominators 10 and 100 | 04.NF.03.05 |
|  |  | Use decimal notation for fractions with denominators 10 or 100. | 04.NF.03.06 |
|  |  | Compare two decimals to hundredths by reasoning about their size. Recognize that comparisons are valid only when the two decimals refer to the same whole. Record the results of comparisons with the symbols $>$, $=$, or <, and justify the conclusions, e.g., by using a visual model. | 04.NF.03.07 |
| Measurement \& Data | Solve problems involving measurement and conversion of measurements. | Know relative sizes of measurement units within one system of units including $\mathbf{k m}, \mathrm{m}, \mathrm{cm} ; \mathbf{k g}, \mathrm{g}$; lb, oz.; l, ml; hr, min, sec. Within a single system of measurement, express measurements in a larger unit in terms of a smaller unit. Record measurement equivalents in a two column table. | 04.MD.01.01 <br> continued |

|  |  | Use the four operations to solve word problems involving distances, intervals of time, liquid volumes, masses of objects, and money, including problems involving simple fractions or decimals, and problems that require expressing measurements given in a larger unit in terms of a smaller unit. Represent measurement quantities using diagrams such as number line diagrams that feature a measurement scale. | 04.MD.01.02 |
| :---: | :---: | :---: | :---: |
|  |  | Apply the area and perimeter formulas for rectangles in real world and mathematical problems. | 04.MD.01.03 |
|  | Represent and interpret data. | Make a line plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. | 04.MD.02.04 |
|  | Geometric measurement: understand concepts of angle and measure angles. | An angle that turns through $n$ one-degree angles is said to have an angle measure of $n$ degrees. | 04.MD.03.05.b |
|  |  | Measure angles in whole-number degrees using a protractor. Sketch angles of specified measure. | 04.MD.03.06 |
|  |  | Recognize angle measure as additive. When an angle is decomposed into non-overlapping parts, the angle measure of the whole is the sum of the angle measures of the parts. Solve addition and subtraction problems to find unknown angles on a diagram in real world and mathematical problems, e.g., by using an equation with a symbol for the unknown angle measure. | 04.MD.03.07 |
| Geometry | Draw and identify lines and angles, and classify shapes by properties of their lines and angles. | Draw points, lines, line segments, rays, angles (right, acute, obtuse), and perpendicular and parallel lines. Identify these in two-dimensional figures. | 04.G.01.01 |
|  |  | Classify two-dimensional figures based on the presence or absence of parallel or perpendicular lines, or the presence or absence of angles of a specified size. Recognize right triangles as a category, and identify right triangles. | 04.G.01.02 |
|  |  | Recognize a line of symmetry for a twodimensional figure as a line across the figure such that the figure can be folded along the line into matching parts. Identify line-symmetric figures and draw lines of symmetry. | 04.G.01.03 |

Table A-15. 2016-17 eMPowerME: Mathematics Standards - Grade 5

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
|  <br> Algebraic <br> Thinking | Write and interpret numerical expressions. | Use parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols. | 05.OA.01.01 |
|  |  | Write simple expressions that record calculations with numbers, and interpret numerical expressions without evaluating them. | 05.OA.01.02 |
|  | Analyze patterns and relationships. | Generate two numerical patterns using two given rules. Identify apparent relationships between corresponding terms. Form ordered pairs consisting of corresponding terms from the two patterns, and graph the ordered pairs on a coordinate plane. | 05.OA.02.03 |
|  <br> Operations: Base Ten | Understand the place value system. | Recognize that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and $1 / 10$ of what it represents in the place to its left. | 05.NBT.01.01 |
|  |  | Explain patterns in the number of zeros of the product when multiplying a number by powers of 10 , and explain patterns in the placement of the decimal point when a decimal is multiplied or divided by a power of 10 . Use whole-number exponents to denote powers of 10 . | 05.NBT.01.02 |
|  |  | Read and write decimals to thousandths using base-ten numerals, number names, and expanded form, e.g., $347.392=3 \times 100+4 \times 10+$ $7 \times 1+3 \times(1 / 10)+9 \times(1 / 100)+2 \times(1 / 1000)$. | 05.NBT.01.03.a |
|  | Perform operations with multi-digit whole numbers and with decimals to hundredths. | Find whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisors, using strategies based on place value, the properties of operations, and/or the relationship between multiplication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models. | 05.NBT.02.06 |
|  |  | Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used. | 05.NBT.02.07 |
| Number \& Operations: Fractions | Use equivalent fractions as a strategy to add and subtract fractions. | Add and subtract fractions with unlike denominators (including mixed numbers) by replacing given fractions with equivalent fractions in such a way as to produce an equivalent sum or difference of fractions with like denominators. | 05.NF. 01.01 <br> continued |

|  |  | Solve word problems involving addition and subtraction of fractions referring to the same whole, including cases of unlike denominators, e.g., by using visual fraction models or equations to represent the problem. Use benchmark fractions and number sense of fractions to estimate mentally and assess the reasonableness of answers. | 05.NF.01.02 |
| :---: | :---: | :---: | :---: |
|  |  | Interpret a fraction as division of the numerator by the denominator ( $a / b=a \div b$ ). Solve word problems involving division of whole numbers leading to answers in the form of fractions or mixed numbers, e.g., by using visual fraction models or equations to represent the problem. | 05.NF.02.03 |
|  | Apply and extend previous understandings | Find the area of a rectangle with fractional side lengths by tiling it with unit squares of the appropriate unit fraction side lengths, and show that the area is the same as would be found by multiplying the side lengths. Multiply fractional side lengths to find areas of rectangles, and represent fraction products as rectangular areas. | 05.NF.02.04.b |
|  | of multiplication and division. | Explaining why multiplying a given number by a fraction greater than 1 results in a product greater than the given number (recognizing multiplication by whole numbers greater than 1 as a familiar case); explaining why multiplying a given number by a fraction less than 1 results in a product smaller than the given number; and relating the principle of fraction equivalence $a / b$ $=(n \times a) /(n \times b)$ to the effect of multiplying $a / b$ by 1. | 05.NF.02.05.b |
|  |  | Solve real world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem. | 05.NF.02.06 |
|  | Convert like measurement units within a given measurement system. | Convert among different-sized standard measurement units within a given measurement system (e.g., convert 5 cm to 0.05 m ), and use these conversions in solving multi-step, real world problems. | 05.MD.01.01 |
| Measurement \& Data | Represent and interpret data. | Make a line plot to display a data set of measurements in fractions of a unit ( $1 / 2,1 / 4$, $1 / 8)$. Use operations on fractions for this grade to solve problems involving information presented in line plots. | 05.MD.02.02 |
|  |  | Recognize volume as an attribute of solid figures and understand concepts of volume measurement. | 05.MD.03.03 |
|  | understand concepts of volume. | A solid figure which can be packed without gaps or overlaps using $n$ unit cubes is said to have a volume of $n$ cubic units. | 05.MD.03.03.b continued |

|  |  | Apply the formulas $V=I \times w \times h$ and $V=b \times h$ for rectangular prisms to find volumes of right rectangular prisms with whole-number edge lengths in the context of solving real world and mathematical problems. | 05.MD.03.05.b |
| :---: | :---: | :---: | :---: |
| Geometry | Graph points on the coordinate plane to solve real-world and mathematical problems. | Use a pair of perpendicular number lines, called axes, to define a coordinate system, with the intersection of the lines (the origin) arranged to coincide with the 0 on each line and a given point in the plane located by using an ordered pair of numbers, called its coordinates. Understand that the first number indicates how far to travel from the origin in the direction of one axis, and the second number indicates how far to travel in the direction of the second axis, with the convention that the names of the two axes and the coordinates correspond (e.g., $x$ axis and $x$-coordinate, $y$-axis and $y$-coordinate). | 05.G.01.01 |
|  |  | Represent real world and mathematical problems by graphing points in the first quadrant of the coordinate plane, and interpret coordinate values of points in the context of the situation. | 05.G.01.02 |
|  | Classify two-dimensional figures into categories based on their properties. | Understand that attributes belonging to a category of two-dimensional figures also belong to all subcategories of that category. | 05.G.02.03 |
|  |  | Classify two-dimensional figures in a hierarchy based on properties. | 05.G.02.04 |

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
|  <br> Proportional <br> Relationships | Understand ratio concepts and use ratio reasoning to solve problems. | Understand the concept of a ratio and use ratio language to describe a ratio relationship between two quantities. | 06.RP.01.01 |
|  |  | Understand the concept of a unit rate $a / b$ associated with a ratio $a: b$ with $b \neq$ 0 , and use rate language in the context of a ratio relationship. | 06.RP.01.02 |
|  |  | Use ratio and rate reasoning to solve real-world and mathematical problems, e.g., by reasoning about tables of equivalent ratios, tape diagrams, double number line diagrams, or equations. | 06.RP.01.03 |
|  |  | Find a percent of a quantity as a rate per 100 (e.g., 30\% of a quantity means 30/100 times the quantity); solve problems involving finding the whole, given a part and the percent. | 06.RP.01.03.c |
|  |  | Use ratio reasoning to convert measurement units; manipulate and transform units appropriately when multiplying or dividing quantities. | 06.RP.01.03.d |
| The Number System | Apply and extend previous understandings of multiplication and division to divide fractions by fractions. | Interpret and compute quotients of fractions, and solve word problems involving division of fractions by fractions, e.g., by using visual fraction models and equations to represent the problem. | 06.NS.01.01 |
|  | Compute fluently with multi-digit numbers and find common factors and multiples. | Fluently add, subtract, multiply, and divide multi-digit decimals using the standard algorithm for each operation. | 06.NS.02.03 |
|  |  | Find the greatest common factor of two whole numbers less than or equal to 100 and the least common multiple of two whole numbers less than or equal to 12. Use the distributive property to express a sum of two whole numbers 1-100 with a common factor as a multiple of a sum of two whole numbers with no common factor. | $\text { 06.NS. } 02.04$ <br> continued |

|  |  | Understand that positive and negative numbers are used together to describe quantities having opposite directions or values (e.g., temperature above/below zero, elevation above/below sea level, credits/debits, positive/negative electric charge); use positive and negative numbers to represent quantities in real-world contexts, explaining the meaning of 0 in each situation. | 06.NS.03.05 |
| :---: | :---: | :---: | :---: |
|  | Apply and extend previous understandings of numbers to the system of rational numbers. | Find and position integers and other rational numbers on a horizontal or vertical number line diagram; find and position pairs of integers and other rational numbers on a coordinate plane. | 06.NS.03.06.c |
|  |  | Write, interpret, and explain statements of order for rational numbers in real-world contexts. | 06.NS.03.07.b |
|  |  | Solve real-world and mathematical problems by graphing points in all four quadrants of the coordinate plane. Include use of coordinates and absolute value to find distances between points with the same first coordinate or the same second coordinate. | 06.NS.03.08 |
|  | Apply and extend | Write and evaluate numerical expressions involving whole-number exponents. | 06.EE.01.01 |
|  | understandings of arithmetic to algebraic | Write expressions that record operations with numbers and with letters standing for numbers. | 06.EE.01.02.a |
|  | expressions. | Apply the properties of operations to generate equivalent expressions. | 06.EE.01.03 |
| Expressions \& Equations |  | Understand solving an equation or inequality as a process of answering a question: which values from a specified set, if any, make the equation or inequality true? Use substitution to determine whether a given number in a specified set makes an equation or inequality true. | 06.EE.02.05 |
|  | Reason about and solve one-variable equations and inequalities. | Use variables to represent numbers and write expressions when solving a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on the purpose at hand, any number in a specified set. | 06.EE.02.06 |
|  |  | Solve real-world and mathematical problems by writing and solving equations of the form $x+p=q$ and $p x$ $=q$ for cases in which $p, q$ and $x$ are all nonnegative rational numbers. | 06.EE.02.07 continued |

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
|  |  | Write an inequality of the form $x>c$ or $x<c$ to represent a constraint or condition in a real-world or mathematical problem. Recognize that inequalities of the form $x>c$ or $x<c$ have infinitely many solutions; represent solutions of such inequalities on number line diagrams. | 06.EE.02.08 |
|  | Represent and analyze quantitative relationships between dependent and independent variables. | Use variables to represent two quantities in a real-world problem that change in relationship to one another; write an equation to express one quantity, thought of as the dependent variable, in terms of the other quantity, thought of as the independent variable. Analyze the relationship between the dependent and independent variables using graphs and tables, and relate these to the equation. | 06.EE.03.09 |
| Geometry | Solve real-world and mathematical problems involving area, surface area, and volume. | Find the area of right triangles, other triangles, special quadrilaterals, and polygons by composing into rectangles or decomposing into triangles and other shapes; apply these techniques in the context of solving real-world and mathematical problems. | 06.G.01.01 |
|  |  | Find the volume of a right rectangular prism with fractional edge lengths by packing it with unit cubes of the appropriate unit fraction edge lengths, and show that the volume is the same as would be found by multiplying the edge lengths of the prism. Apply the formulas $V=I w h$ and $V=b h$ to find volumes of right rectangular prisms with fractional edge lengths in the context of solving real-world and mathematical problems. | 06.G.01.02 |
|  |  | Draw polygons in the coordinate plane given coordinates for the vertices; use coordinates to find the length of a side joining points with the same first coordinate or the same second coordinate. Apply these techniques in the context of solving real-world and mathematical problems. | 06.G.01.03 |
|  |  | Represent three-dimensional figures using nets made up of rectangles and triangles, and use the nets to find the surface area of these figures. Apply these techniques in the context of solving real-world and mathematical problems. | 06.G.01.04 |
| Statistics \& Probability | Develop understanding of statistical variability. | Recognize a statistical question as one that anticipates variability in the data related to the question and accounts for it in the answers. | 06.SP.01.01 <br> continued |

|  | Understand that a set of data collected to answer a statistical question has a distribution which can be described by its center, spread, and overall shape. | 06.SP.01.02 |
| :---: | :---: | :---: |
|  | Recognize that a measure of center for a numerical data set summarizes all of its values with a single number, while a measure of variation describes how its values vary with a single number. | 06.SP.01.03 |
|  | Display numerical data in plots on a number line, including dot plots, histograms, and box plots. | 06.SP.02.04 |
|  | Summarize numerical data sets in relation to their context. | 06.SP.02.05 |
| Summarize and describe distributions. | Summarize numerical data sets in relation to their context by giving quantitative measures of center (median and/or mean) and variability (interquartile range and/or mean absolute deviation), as well as describing any overall pattern and any striking deviations from the overall pattern with reference to the context in which the data were gathered. | 06.SP.02.05.c |

| :---: | :---: | :---: | :---: |
| Ratios \& Proportional Relationships | Analyze proportional relationships and use them to solve real-world and mathematical problems. | Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quantities measured in like or different units. | 07.RP.01.01 |
|  |  | Decide whether two quantities are in a proportional relationship, e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight line through the origin. | 07.RP.01.02.a |
|  |  | Identify the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships. | 07.RP.01.02.b |
|  |  | Represent proportional relationships by equations. | 07.RP.01.02.c |
|  |  | Use proportional relationships to solve multistep ratio and percent problems. <br> Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error. | 07.RP.01.03 |
| The Number System | Apply and extend previous understandings of operations with fractions. | Describe situations in which opposite quantities combine to make 0 | 07.NS.01.01.a |
|  |  | Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational numbers. | 07.NS.01.02 |
|  |  | Solve real-world and mathematical problems involving the four operations with rational numbers. | 07.NS.01.03 |
| Expressions \& Equations | Use properties of operations to generate equivalent expressions. | Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients. | 07.EE.01.01 |
|  |  | Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. | 07.EE.01.02 |
|  | Solve real-life and mathematical problems using numerical and algebraic expressions and equations. | Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. | 07.EE.02.03 |
|  |  | Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities. | 07.EE.02.04 <br> continued |

| Domain | Slandard | Standard <br> Coder |  |
| :--- | :--- | :--- | :--- |
|  |  | Solve word problems leading to equations of <br> the form $p x+q=r$ and $p(x+q)=r$, where $p$, <br> $q$, and $r$ are specific rational numbers. Solve <br> equations of these forms fluently. Compare <br> an algebraic solution to an arithmetic <br> solution, identifying the sequence of the <br> operations used in each approach. | 07.EE.02.04.a |

Table A-18. 2016-17 eMPowerME: Mathematics Standards - Grade 8

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
| The Number System | Know that there are numbers that are not rational, and approximate them by rational numbers. | Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line diagram, and estimate the value of expressions (e.g., $\pi^{2}$ ). | 08.NS.01.02 |
| Expressions \& Equations |  | Use numbers expressed in the form of a single digit times an integer power of 10 to estimate very large or very small quantities, and to express how many times as much one is than the other. | 08.EE.01.03 |
|  | Work with radicals and integer exponents. | Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology. | 08.EE.01.04 |
|  | Understand the | Graph proportional relationships, interpreting the unit rate as the slope of the graph. Compare two different proportional relationships represented in different ways. | 08.EE.02.05 |
|  | proportional relationships, lines, and linear equations. | Use similar triangles to explain why the slope m is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation $y=m x$ for a line through the origin and the equation $y=m x+$ $b$ for a line intercepting the vertical axis at $b$. | 08.EE.02.06 |
|  | Analyze and solve linear equations and pairs of simultaneous linear equations. | Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x=a, a=a$, or $a=b$ results (where $a$ and $b$ are different numbers). | 08.EE.03.07.a |
|  |  | Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms. | 08.EE.03.07.b |
|  |  | Analyze and solve pairs of simultaneous linear equations. | 08.EE.03.08 |
|  |  | Solve real-world and mathematical problems leading to two linear equations in two variables. | 08.EE.03.08.c continued |

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
| Functions | Define, evaluate, and compare functions. | Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output. | 08.F.01.01 |
|  |  | Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). | 08.F.01.02 |
|  | Use functions to model relationships between quantities. | Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two ( $x, y$ ) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values. | 08.F.02.04 |
|  |  | Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally. | 08.F.02.05 |
| Geometry | Understand congruence and similarity using physical models, transparencies, or geometry software. | Verify experimentally the properties of rotations, reflections, and translations: Angles are taken to angles of the same measure. | 08.G.01.01.b |
|  |  | Understand that a two-dimensional figure is congruent to another if the second can be obtained from the first by a sequence of rotations, reflections, and translations; given two congruent figures, describe a sequence that exhibits the congruence between them. | 08.G.01.02 |
|  |  | Describe the effect of dilations, translations, rotations, and reflections on two-dimensional figures using coordinates. | 08.G.01.03 |
|  |  | Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the angle-angle criterion for similarity of triangles. | 08.G.01.05 |
|  | Understand and apply the Pythagorean Theorem. | Explain a proof of the Pythagorean Theorem and its converse. | 08.G.02.06 |
|  |  | Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions. | 08.G.02.07 <br> continued |

| Domain | Cluster | Standard | Standard Code |
| :---: | :---: | :---: | :---: |
|  | Solve real-world and mathematical problems involving volume of cylinders, cones, and spheres. | Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real-world and mathematical problems. | 08.G.03.09 |
| Statistics \& Probability | Investigate patterns of association in bivariate data. | Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns such as clustering, outliers, positive or negative association, linear association, and nonlinear association. | 08.SP.01.01 |
|  |  | Know that straight lines are widely used to model relationships between two quantitative variables. For scatter plots that suggest a linear association, informally fit a straight line, and informally assess the model fit by judging the closeness of the data points to the line. | 08.SP.01.02 |
|  |  | Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. | 08.SP.01.03 |
|  |  | Understand that patterns of association can also be seen in bivariate categorical data by displaying frequencies and relative frequencies in a two-way table. Construct and interpret a two-way table summarizing data on two categorical variables collected from the same subjects. Use relative frequencies calculated for rows or columns to describe possible association between the two variables. | 08.SP.01.04 |

## APPENDIX C—PARTICIPATION RATES

Table C-1. 2017-18 eMPowerME: Summary of Participation by Demographic Category-Mathematics

| Description | Tested |  |
| :--- | :---: | :---: |
|  | Number | Percent |
| All Students | 78,792 | 100.00 |
| Male | 40,464 | 51.36 |
| Female | 38,318 | 48.63 |
| Gender Not Reported | 10 | 0.01 |
| Hispanic or Latino | 1,829 | 2.32 |
| Native American | 657 | 0.83 |
| Asian | 1,191 | 1.51 |
| Black or African American | 2,819 | 3.58 |
| Native Hawaiian or Pacific Islander | 93 | 0.12 |
| White (non-Hispanic) | 70,068 | 88.93 |
| Two or More Races (non-Hispanic) | 2,125 | 2.70 |
| Race not reported | 10 | 0.01 |
| Migrant Students |  | 0.00 |
| Migrant: All Other Students | 78,792 | 100.00 |
| Currently receiving LEP services | 2,696 | 3.42 |
| Former LEP student - monitoring year 1 | 183 | 0.23 |
| Former LEP student - monitoring year 2 | 185 | 0.23 |
| LEP: All Other Students | 75,728 | 96.11 |
| Students with an IEP | 14,258 | 18.10 |
| IEP: All Other Students | 64,534 | 81.90 |
| Plan 504 | 3,394 | 4.31 |
| Plan 504: All Other Students | 75,398 | 95.69 |
| SES: All Other Students | 42,401 | 53.81 |
| Students receiving Title 1 Services | 6,880 | 8.73 |
| Title 1: All Other Students | 71,912 | 91.27 |
| Economically Disadvantaged Students | 36,391 | 46.19 |

# Maine Educational Assessment for Mathematics and English Language Arts/Literacy Grades 3-8 eMPowerME Tools, Accommodations \& Supports 

## Introduction

Universal tools are available to all students for all items, unless designated as item specific. All support(s) and accommodation(s) used for the assessment of an individual student will be the result of a team decision made at the local level, with teams having variances in decision-making capacities. Supports and accommodations must be consistent with the student's normal routine during instruction and assessment.
Accommodations do not alter what the test measures or the comparability of results. When used properly, accommodations remove the barriers to participation in the assessment and provide students with diverse learning needs an equitable opportunity to demonstrate their knowledge and skills.
Scrap/scratch paper may be made available to all students during testing sessions. NO preauthored aids such as templates, graphic organizers, reference sheets, multiplication tables, etc. are allowed.

## Terminology \& Definitions

Accommodations $=$ Changes in procedures or materials that do not alter what the test measures, and are used to increase equitable access during assessment for students for whom there is a documentation of the need on an Individualized Education Program/Plan (IEP) or 504 Plan.

## Embedded = Computer-delivered features that are a constructed part of the test delivery platform system.

Non-Embedded $=$ Provisions outside of the computer-based test administration system. This may include the provision of an outside person item, or change in setting or time.

Read-Aloud = For students with documented (IEP/504 only) reading-related disabilities, or students who are blind/visually impaired and do not have adequate braille skills, text is read aloud to the student via a (non-embedded) human reader. Read-Aloud should be consistent with the student's normal routine during instruction and assessments. ReadAloud content should be provided for specific text as outlined in Table 1 on page 9.

Scribe $=$ Students with documented (IEP/504) dysgraphia difficulties may dictate answers to a scribe in an individual setting. A human scribe records verbatim what a student dictates and must give the student an opportunity to review scribed text. If a scribe is an approved
accommodation in a student's IEP/504 plan, a scribe is allowed for all test sessions including the essay. Scribed text must be entered into the online testing platform-no paper submissions accepted.

Supports $=$ Support(s) may provide more accessibility to the test for and are determined on an individual basis by an educational team such as Response to Intervention (RtI) and/or Student Assistance Team. Supports must be consistent with the student's normal routine during instruction. Provision of supports does not alter the construct of any test item.
"Team" = Local educational teams such as Response to Intervention (RtI), Student Assistance Teams and/or Language Acquisition Teams.

Text-To-Speech (TTS) = For students with documented (IEP/504 only) reading-related disabilities, or students who are blind/visually impaired and do not have adequate braille skills, text is read aloud to the student via (embedded) TTS technology. TTS should be consistent with the student's normal routine during instruction and assessment.
Headphones/earbuds are necessary unless tested individually in a separate setting. TTS is available only for specific text outlined in Table 1 on page 9.
$\underline{\text { Universal Tool }}=$ Functions that are available to all students for all items, including some that are designated as item-specific tools.

For more information, see the MEA Portal User Guide, which is available on the MEA Help \& Support page: http://maine.onlinehelp.measuredprogress.org/guides
If you have any questions or concerns, contact the Measured Progress Service Center at maineservicedesk@measuredprogress.org or (855) 652-8929
OR
Nancy Godfrey, Assessment Coordinator at nancy.godfrey@maine.gov (207) 624-6775

[^0]
## UNIVERSAL TOOLS - Available to All

These tools are available on all supported testing devices and are available to all students for all items, unless designated as item specific tools.

## Embedded Universal Tools

| Tool | Tool Icon | Description | All Items? |
| :---: | :---: | :---: | :---: |
| Ruler |  | The vector-based, partially translucent ruler is rotatable, draggable and resizable by the student. | item specific Math only |
| Protractor | $\square$ | The vector-based, partially translucent protractor is rotatable, draggable and resizable by the student. | item specific Math only |
| Calculators |  | Two calculator modes are available: 1) Basic, and 2) Scientific. <br> - The Basic calculator will be available for students Grades 3-6 taking the Mathematics test. <br> - The Scientific calculator will be available for students Grades 7-8 taking the Mathematics tests. | item specific Math only |
| *Sketch \& Highlight* | $\lambda>4$ | The sketch pad provides the following functionalities: <br> - Sketch or draw using black, red or blue brushes <br> - Highlight using a semi-transparent yellow highlighter brush <br> - Erase drawings and highlighting using the eraser brush. | Yes |
| Notepad |  | A notepad is provided for students to write different notes for different items, meaning it uniquely persists per item. The notepad is resizable, draggable, and displays a timestamp for when the student last edited content. | Yes |

## Notepad Details:

- The notepad is retained per item. If the student writes notes on Item 1, navigates to Item 2, returns to Item 1, notes will still be there.
- Notes on passages are not viewable for all items pertaining to the passage. They will only appear for the item that they were written on.
- Notes DO NOT remain if a test is paused.
- Notes are NOT retained if a student submits a test session and then has state-approved reactivation.
- Students should NOT use the notepad to construct rough drafts.

The following tools must be individually activated by the student-e.g., Reverse Contrast enabled does not automatically set the screen as black with white letters; it simply gives the student the ability to switch back and forth.

| *Answer Masking* | (A) (B) between 4 and 6 (C) between 7 and 10 (D) between 11 and 14 | The student "hides" possible answer choices (for multiple -choice items only). | Yes |
| :---: | :---: | :---: | :---: |
| *Guideline Tool* | $a b c$ | The student uses an onscreen tool to assist in reading by raising and lowering the tool for each line of text onscreen. This can be moved anywhere within the item. | Yes |
| Jump To Item | Question 1 v | Student can access list of item numbers in a session and jump to a specific item number by clicking the down arrow next to the question number. | Yes |
| Formatting Tools | B I | Students are able to cut, copy, paste, undo, redo, bold, italicize, underline. | Yes |
| Bookmark/ <br> Star Item |  | Student can bookmark or star $\hbar$ an item as a reminder to return. | Yes |
| *Custom Masking* | $\square$ | Provides the ability to mask certain parts of the test interface or question. | Yes |
| *Screen Zoom* | Screen Zoom: - 0 | NEW 2018: Students can magnify the entire screen up to 300 percent. This is a full-vector zoom of the entire screen. Text can be enlarged in 4 increments: 100\%, 150\%, 200\%, 300\%. | Yes |
| *Reverse Contrast* | $0$ | Inverts all color values in the user interface. | Yes |

* Denotes a feature that will be automatically enabled for all students. If Universal Tools are disabled ("Turn Off All Universal Tools"), these six tools are turned off.

## Non-Embedded Universal Tool

| Tool | Description |
| :---: | :--- |
| Scrap/Scratch Paper | Scrap/scratch paper is available to students during testing sessions and must be <br> collected/shredded at the end of each test session. NO pre-authored aids such <br> as templates, graphic organizers, reference sheets, multiplication tables, etc. |

## SUPPORTS

## Requiring "Team" Documentation

(e.g., Response to Intervention (RtI), Student Assistance, Language Acquisition Team) Users will assign supports to students within the Administration component; however, these accommodations require persons/item
s outside of the testing platform. The following supports are determined by the appropriate educational team, documented in an RtI, SAT Plan and/or Language Acquisition Plan, and must be provided in the testing environment/session by a School Test Coordinator and/or Test Administrator.

## Embedded Support

| Support | Description |
| :--- | :--- |
| Turn off <br> universal tools <br> (team-documented) | Selecting this accommodation will turn off the sketch and highlight tool, the <br> guideline tool, screen zoom, the reverse contrast tool, custom masking, and <br> the answer masking tool. |

## Non-Embedded Supports

| Support | Description |
| :--- | :--- |
| Distraction Reduction <br> (team-documented) | As documented in the support plan (e.g., study carrel, noise buffer, <br> etc.) |
|  <br> Devices <br> (team-documented) | Visual, auditory and communication supports or aids used regularly <br> for instruction as documented in the support plan. |
| External Calculator (for <br> calculator-allowable <br> items/sections ONLY) <br> (team-documented) | Non-embedded calculator for students needing a special calculator <br> such as large display or talking calculator unavailable within the <br> assessment platform. USE IN CALCULATOR ALLOWABLE <br> ITEMS/SECTIONS ONLY. |
| Color Overlays <br> (team-documented) | Students may use personal color overlays to place on the computer <br> screen if the 12 embedded Color Contrasts do not meet the student's <br> needs. |
| Individual Separate Setting <br> (team-documented) | Individual test setting to minimize distractions for students whose test <br> is administered out of the classroom as documented in the support <br> plan. |
| Small Group Separate Setting <br> (team-documented) | Small group testing to minimize distractions for students whose test is <br> administered out of the classroom as documented in the support plan. |

| Support | Description |
| :--- | :--- |
| Extended Time <br> (team-documented) | Extended time beyond standard administration testing schedule. <br> Individual scheduling may be used for a student whose school <br> performance is noticeably affected by the time of day or day of the <br> week on which it is administered. |
| Breaks <br> (team-documented) | Multiple or frequent breaks for attention, distractibility, physical <br> and/or medical conditions as documented in the support plan. |
| Bilingual Word Translation <br> (Language Acquisition Team) | MATHEMATICS ONLY: Word-to-word translation glossary with NO <br> definitions as determined by Language Acquisition Committee/Team <br> for English Learners (ELs). |

# ACCOMMODATIONS Requiring IEP/504 Documentation 

Enabled in System by DAC/ITC/STC

Approved users will assign accommodations to students within the Administration component. Accommodations are entered and edited via the Student Profile by the District Assessment Coordinator (DAC), IT Coordinator (ITC) or the School Test Coordinator (STC) users.

The following Accommodations are determined by an appropriate team, documented in an IEP and/or 504 Plan, and enabled in the testing system by a School Test Coordinator or District Assessment Coordinator. Embedded accommodations will be available to students testing using the MEA kiosk.

## Embedded Accommodations

| Accommodation | Tool Icon | Description <br> **Text-to-Speech (TTS) <br> (IEP/504 documented) <br> MATHMATICS <br> $\&$ <br> ESSAY |
| :---: | :---: | :--- |
| Text-to-Speech | Students can play, pause, or stop audio. Students can <br> adjust the rate and volume, as well as select specific text to <br> be read aloud on demand. Items support default and on- <br> demand Ioad playback orders. Text-to-Speech is assigned <br> by content area and designated allowable text (directions <br> vs. test questions, vs. answer choices vs. passages). **See <br> Table 1 page 9, which outlines allowable text. NOTE: Speed <br> of TTS is not adjustable. Voice Pac is the voice set as the <br> default on the device the student is using for testing. See <br> Kiosk Installation Guide. <br> - Text-to-Speech Math <br> - Text-to-Speech Essay |  |
| Color Contrast <br> (IEP/504 documented) | A | Students have the ability to choose a text and background <br> color from a set of 12 predefined color combinations. |

## Non-Embedded Accommodations

Users will assign accommodations to students within the Administration component; however, these accommodations require persons/items outside of the testing platform. The following Accommodations are determined by the appropriate educational team, documented in an IEP and/or 504 Plan, and must be provided in the testing environment/session by a School Test Coordinator and/or Test Administrator.

| Accommodation | Description |
| :--- | :--- |
| Scribe |  |
| (IEP/504 documented) | The student may dictate answers to scribe in an individual setting. <br> Human scribe records verbatim what a student dictates, and must give <br> the student an opportunity to review scribed text. If scribe is an <br> approved accommodation in a student's IEP/504 plan, a scribe is <br> allowed for the essay. Scribed text must be entered into the online <br> testing platform-no paper submissions accepted. |
| *Read-Aloud <br> (IEP/504 documented) <br> MATH \& ESSAY | Text is read aloud to student by Test Administrator human reader as <br> documented in the IEP/504 plan. Read-Aloud is restricted to <br> designated content areas and text within item. **See Table 1 page 9, <br> which outlines allowable text. |
| **American Sign Language <br> (IEP/504 documented) <br> MATH \& ESSAY | Trained personnel may use sign language to administer the test for <br> deaf or hearing-impaired students as documented in the IEP/504 plan. <br> **Sign language may be used only for content selected to match <br> availability for Text-To-Speech. See Table 1page 9, which outlines <br> allowable text. |
| Braille | Assessment provided via paper in the braille code (UEB, UEB with <br> Nemeth and/or EBAE/Nemeth) in which the student is most proficient <br> (IEP/504 documented) <br> as documented in the IEP/504 plan. |
| Accommodation 01 | An educational team may request that a student be provided an <br> accommodation not included on this standard list of accommodations. <br> Like all other accommodations, these should be consistent with the <br> student's normal routine during instruction and assessment. Requests <br> should be made to the DOE when accommodation plans are being <br> made for a student prior to testing. DOE approval must be received for <br> the requested accommodation to be coded as an 01 accommodation. <br> Without pre-approval, use of an 01 accommodation will result in no <br> credit being given. |

## Text-To-Speech / Read-Aloud / American Sign Language Specifications (Requiring IEP/504 Documentation)

The following chart outlines the components of grade-level, content-level, and specific text that will be accessed within the test platform system by students who have IEP/504 documented approval for Text-To-Speech (TTS). The same chart guidelines should follow for non-embedded accommodations documented by IEP/504 with approval for a human reader (Read-Aloud) and an interpreter (Sign Language). TTS and/or Read-Aloud must be made available to all students who are blind/visually impaired who do not have braille reading skills.

Table 1

| TTS/Read-Aloud/ASL |  |  |
| :---: | :---: | :---: |
| Content Area/Sessions | Item | Gr. 3-8 |
| Reading $1 \& 2$ | Test Directions | No |
| Reading $1 \& 2$ | Test Questions | No |
| Reading 1\&2 | Answer Choices | No |
| Reading 1\&2 | Reading Passages | No |
|  |  |  |
| Mathematics 1\&2 | Test Directions | Yes |
| Mathematics 1\&2 | Test Questions | Yes |
| Mathematics 1\&2 | Answer Choices | Yes |
| Mathematics 1\&2 | Passages | Yes |

| Writing \& Language 1\&2 | Test Questions | No |
| Writing \& Language 1\&2 | Answer Choices | No |
| Writing \& Language 1\&2 |  | Yes |
|  |  |  |

# Text-To-Speech / Read-Aloud / American Sign Language Specifications Requiring IEP/504 Documentation <br> Text that CAN and CANNOT be read 

## Reading Example - NO TTS/Read Aloud/ASL

## Practice Test

## Directions

You will now read two related passages and answer the questions that follow. Some of these questions will ask you to compare the two passages.

## Selection 1 <br> Pioneering in the Ozarks

by William Anderson
1 Early on the morning of July 17, 1894, Laura and Manly and Rose said good-bye to Pa and Ma and Mary and Carrie and Grace. They left De Smet in a covered wagon and headed south.
2
For a month the Wilders drove through South Dakota, Nebraska, and Kansas. Each night they
 camped in a new spot, and Laura cooked over a campfire. She told Rose they were on one long

Laura Ingalls Wilder, her husband, Almanzo, and their daughter, Rose, journeyed West during the summer of 1894. They were to begin a new life growing apples. They decided to settle in a place called Mansfield, Missouri. Mansfield was called "The Gem City of the Ozarks," and "The Land of the Big Red
 Apple."

Selection 2 On the Way Home<br>by Laura Ingalls Wilder

## August 22

A good start at 7:15 and this morning we are driving through pretty country. Crops look good. Oats are running 30 to 60 bushels to the acre, wheat from 10 to 30 . All the wood you want can be had for the hauling and coal is delivered at the house for $\$ 1.25$ a ton. Land is worth from

1. In Selection 1, how does Rose feel about leaving Rocky Ridge Farm?

A She thinks life will be easier in the city.
B She is excited to live in a place with more people and jobs.
C She is worried about moving far away from the farm.

D She hopes her parents will take care of the farm while she is away.

# Writing \& Language Example NO TTS/Read Aloud/ASL 

## Sample Items

## Directions

Read the passage. Then answer the questions that follow.

NO
Directions

## Gray Wolves

1. Gray wolves are large, dog-like animals. 2. They have long, bushy tails, and their bodies are covered in thick fur. 3. Their fur is usually a mix of gray and brown colors. 4. Just because they are all called gray wolves, some have coats that are all black, brown, or white.
2. Most gray wolves live in North America and Asia. 6. They usually travels together in packs of six to ten wolves. 7. A wolf pack is usually made up of a mother and a father, their young pups, and the pups' older brothers and sisters. 8. Gray wolves are also called timber wolves.
3. How should the underlined word in sentence 2 be changed?

A NO CHANGE

B bodes
C bodys
D bodees

Use the information below to answer questions 5 and 6.

Look at this problem.
Samira went jogging on Saturday. She ran a total of 8.5 miles in 1.75 hours. Samira burned a total of 1,050 calories while jogging. Assume that she burned the same number of calories each hour while jogging.
Lucas also went jogging. He ran a total of 10 miles in 2.25 hours.

At what rate, in calories per hour, did Samira burn calories while jogging?
5. Which values from the given information are needed to answer the problem?

A 10 and 2.25

B 1.75 and 8.5
C 1.75 and 1,050
D 2.25 and 1,050

# NEW 201 7: Essay Example 

Directions Read the passage summaries. Then answer the question that follows. | YES |
| :---: | :---: |
| Directions |

## From the Mixed-Up Files of Mrs. Basil E. Frankweiler*

Jamie and Claudia are given one hour to find a mysterious secret file about Michelangelo's Angel without making a mess of the many files. Claudia and Jamie devise a plan and make a list of 11 related categories $\square$ search. They divide the list but do not find the secret file. When Jamie exclaims, "Boloney," Claudia remembers that the statue was bought in Bologna, Italy, which leads them to the secret file.

## The Missing Mystery Writer*

Someone has disappeared while backpacking in the wilderness. A group of amateur detectives are surprised when they learn the identity of the missing person: a popular crime writer. They are familiar with his books, some of which have been made into a series for television. They are excited when the writer's agent reveals that the author's most recent book is based on members of their organization.

Write your answer to question 1 in the space provided in your Student Answer Booklet.

1. You have read two passages with characters following a process to solve a mystery. Write an essay explaining ways that people solve mysteries. Your essay should explain two or three main ideas you want readers to learn about solving mysteries. Be sure to
a. introduce the topic of your essay and the main ideas in the first paragraph.
b. use facts, definitions, and details from the passages to develop each idea.

c. use quotations from each passage to give examples of your main ideas.
d. use linking words and phrases to help ideas flow across sentences and paragraphs.
e. write a concluding statement or paragraph that restates the ideas you want the readers to learn from your essay.

## APPENDIX F—RUBRIC DATA

## Scoring Rubrics

All writing items were scored against a four-trait analytic rubric (see tables below). The scoring scale options of $0,1,2,3$, and 4 were applied to each trait. When a response did not conform to score point parameters, scorers could designate the response as one of the following:

- Blank: There is no attempt to respond to the item; no uploaded material is provided and no response has been typed.
- Unreadable: The text on the scorer's computer screen is indecipherable or too faint to read accurately.
- Escalate: The response requires clarification or adjudication by Scoring Leadership. A score is assigned by leadership after reviewing
- Off Topic: The response is totally irrelevant or does not address the prompt
- No Score: The response is otherwise unscorable (off-task, random marks, etc.)

Table G-5. 2015-16 eMPowerME: Scoring Resolution Process

| Designation | Resolution Process |
| :--- | :--- |
| Blank | Responses scored Blank were sent to another scorer for a second read. <br> Responses scored Blank twice were converted to zeros ('0's) for reporting <br> purposes. Any discrepancies were resolved by the Scoring Leadership. |
| Unreadable | Those responses judged unreadable were forwarded to special queue within <br> iScore to be reviewed by a Scoring Supervisor who resolved the student <br> score. (If the response remained unreadable after review, the Scoring <br> Supervisor assigned a score of "0"). Unreadable responses are limited to <br> paper-based tests |
| Off Topic | Responses that were irrelevant or unrelated to the prompt or otherwise was <br> not an attempt to respond to the prompt. |
| Escalation | Responses that were unusual and were not able to be scored based on the <br> training material without further consultation with Scoring Leadership and/or <br> the DOE. Scoring leadership reviewed and provided final scores for <br> responses in the escalation queue and provided feedback to the scorers as <br> needed. |
| No Score | Responses that were unable to be scored for any other reason, which could <br> include drawings, stray marks, or other non-blank responses that could not <br> receive a numeric score. |

Scorers also had the option of flagging a response as a "Crisis" (sometimes referred to as Alert paper) requiring immediate review and possible immediate action by scoring leadership. Crisis papers were reviewed by the Scoring Project Manager. When papers were confirmed as being Crisis papers, the response and student demographic information was provided to the Maine DOE for further action.

Crisis responses could include but were not limited to one or more of the following:

- Thoughts of suicide
- Criminal activity
- Alcohol or drug use
- Extreme depression
- Violence
- Rape, sexual or physical abuse
- Self-harm or intent to harm others
- Neglect
- Any indication that the author or another child was in danger or under threat of danger

|  | 3 | $0.76(0.67)$ | 0.55 | $0.86(0.79)$ | $0.69(0.60)$ | $0.72(0.58)$ | $0.80(0.76)$ |
|  | 4 | $0.75(0.65)$ | 0.53 | $0.84(0.78)$ | $0.62(0.49)$ | $0.72(0.62)$ | $0.83(0.75)$ |
| ELA | 5 | $0.75(0.66)$ | 0.53 | $0.84(0.78)$ | $0.62(0.49)$ | $0.77(0.68)$ | $0.79(0.72)$ |
|  | 6 | $0.77(0.68)$ | 0.55 | $0.83(0.75)$ | $0.74(0.63)$ | $0.76(0.66)$ | $0.80(0.71)$ |
|  | 7 | $0.77(0.68)$ | 0.55 | $0.83(0.76)$ | $0.72(0.60)$ | $0.76(0.68)$ | $0.81(0.71)$ |
|  | 8 | $0.79(0.70)$ | 0.57 | $0.82(0.73)$ | $0.75(0.64)$ | $0.80(0.74)$ | $0.81(0.69)$ |

Table S-2. 2017-18 eMPowerME: Summary of Decision Accuracy (and Consistency) Results
by Content Area and Grade-Conditional on Cutpoint

| Content Area | Grade | Substantially Below Proficient / Partially Proficient |  |  | Partially Proficient / Proficient |  |  | Proficient / Proficient with Distinction |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Accuracy (consistency) | False |  | Accuracy (consistency) | False |  | Accuracy (consistency) | False |  |
|  |  |  | Positive | Negative |  | Positive | Negative |  | Positive | Negative |
| Mathematics | 3 | 0.91 (0.87) | 0.04 | 0.05 | 0.88 (0.84) | 0.06 | 0.06 | 0.95 (0.93) | 0.03 | 0.02 |
|  | 4 | 0.91 (0.88) | 0.04 | 0.04 | 0.89 (0.84) | 0.05 | 0.06 | 0.95 (0.92) | 0.03 | 0.02 |
|  | 5 | 0.91 (0.86) | 0.06 | 0.04 | 0.88 (0.83) | 0.05 | 0.06 | 0.95 (0.92) | 0.03 | 0.02 |
|  | 6 | 0.88 (0.84) | 0.06 | 0.05 | 0.87 (0.83) | 0.06 | 0.06 | 0.94 (0.91) | 0.03 | 0.02 |
|  | 7 | 0.90 (0.86) | 0.06 | 0.04 | 0.88 (0.83) | 0.05 | 0.07 | 0.95 (0.93) | 0.03 | 0.02 |
|  | 8 | 0.89 (0.84) | 0.07 | 0.04 | 0.85 (0.80) | 0.07 | 0.07 | 0.93 (0.90) | 0.03 | 0.04 |
| ELA | 3 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |
|  | 4 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |
|  | 5 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |
|  | 6 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |
|  | 7 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |
|  | 8 | 0.93 (0.90) | 0.03 | 0.04 | 0.90 (0.86) | 0.05 | 0.05 | 0.93 (0.90) | 0.03 | 0.03 |

## APPENDIX T—COMMITTEE MEMBERSHIP

Table T-1. 2017-18 eMPowerME: Technical Advisory Committee Members

| Brian Gong | Executive Director of Center for Assessment, NCIEA |
| :--- | :--- |
| Nathan Dadey | Postdoctoral Fellow, NCIEA |
| Martha Thurlow | Director, National Center on Educational Outcomes |
| Betsy Webb | Superintendent, Bangor Public Schools |
| April Zenisky |  <br> Administration, University of Massachusetts Amherst |

It's all about student learning.
