Chapter 1. Overview of MSAA and 2022 Updates

1.1 Purposes and Uses of the MSAA and MSAA Science

The Multi-State Alternate Assessment (the MSAA) is a multidimensional, fixed form, summative assessment system designed to promote increasingly higher academic outcomes for students with the most significant cognitive disabilities to prepare them for a broader array of post-secondary outcomes. The MSAA Science is designed to measure grade-level academic science content that is aligned with, and derived from, MSAA Partners' science content standards. This test contains built-in supports that do not change the construct being measured, to allow students to use materials they are most familiar with and communicate what they know and what they can do as independently as they are able. The MSAA Science, for some of the MSAA Partners, is part of the comprehensive assessment program, which includes the MSAA ELA and mathematics. Many aspects of the assessment program delivery for the MSAA Science are consistent with what is provided for MSAA ELA and mathematics, including the online assessment platform, training requirements, and participation guidelines. One difference in science is that all three grades are linear tests instead of stage-adapted assessments.

The MSAA Science is an alternate assessment aligned with alternate academic achievement standards (AA-AAAS) as described in the Elementary and Secondary Education Act (ESEA). This law mandates that all students participate in assessments that measure student achievement of grade-level content standards. The MSAA Science was developed to ensure that all students with the most significant cognitive disabilities can participate in a summative assessment that provides a measure of what they know and can do in relation to grade-level science content standards. To ensure that MSAA Science measures student achievement of alternate academic achievement standards aligned to grade-level science content standards, this technical report provides the standard psychometric analyses and descriptions of technical procedures commonly found in state assessment technical reports.

1.2 Initial Administration of the MSAA Science

The 2022 administration of the MSAA Science was the first operational administration. The MSAA Science Partners for 2022 comprise Arizona, Bureau of Indian Education (BIE), Maine, and the U.S. Virgin Islands. The impact of COVID-19 worldwide resulted in cancellation of the 2020 field test administration (which was scheduled to occur in Maine only) and continued to influence many MSAA Partners' participation levels in 2021 and 2022. The impact for the MSAA Science was that the operational implementation was delayed from 2021 to 2022. The MSAA Science was administered to Arizona and Maine only as a census field test in 2021. A standard setting was conducted in July 2022 for the MSAA Science, resulting in provisional performance levels. The performance levels will be reviewed in summer 2023. The data from 2022, along with data collected in 2023, will be used to determine the final performance levels. The standard setting technical report is available by contacting the MSAA Science Partners at MSAA@azed.gov. Additional detailed information about work leading up to the 2022 administration is available in Chapter 2.

In fall 2021, in preparation for the census field test administration in 2021, the MSAA Science had sample items available through the online assessment platform for grades 5 and High School (HS), which both included one standalone set (three items) per grade. New for fall 2022, the number of MSAA Science sample items was expanded. The new sample items, as well as the previously available sample items, were available to teachers through the online assessment platform. Grades 5, 8, and HS now have

sample tests inclusive of one standalone set and one cluster, totaling 9 sample items per grade. The sample items include the grade-specific Directions for Test Administration (DTA), which corresponds with the items in the online system to emulate and standardize the student testing experience. These sample items are located at <https://www.msaaassessment.org/sample-items> and can be accessed year-round. Additional detailed information about test design and items is available in Chapter 3.

Additionally, for the 2022 administration, test documentation was updated to reflect changes in the Test Administration Manual (TAM), MSAA Online Assessment System User Guide for Test Administrators, MSAA Online Assessment System User Guide for Test Coordinators, Directions for Test Administration (DTA), and the *MSAA 2022 Guide for Score Report Interpretation Guide*. The TAM, MSAA Online Assessment System User Guide for Test Administrators, MSAA Online Assessment System User Guide for Test Coordinators, DTA, and online training modules were revised from the previous version to streamline information and provide more clarity to Test Administrators (TAs) and Test Coordinators (TCs). Additional detailed information about this process is available in Chapter 5.

1.3 Intended MSAA Science Score Interpretations and Uses

The MSAA Science is designed, developed, and implemented to support four primary intended score interpretations and uses, described in the following sections.

Primary Intended MSAA Science Score Interpretation

The MSAA Science scores provide reliable and valid information about the extent to which students with the most significant cognitive disabilities attain important knowledge and skills in elementary, middle, and high school multidimensional science concepts.

Primary Intended MSAA Science Score Uses

- Schools and districts use the MSAA Science and its results to monitor trends in student performance and design professional development for teachers on how to monitor trends.
- The MSAA and its results are used to help teachers integrate MSAA scores and other information with their instructional planning.
- Parents understand and interpret MSAA scores and other information correctly to understand what their child knows and can do.

The intended score interpretation and uses stated here align with the claim developed for the science assessment. The claim states:

- Students can use the majority¹ of the disciplinary core ideas, practices, and crosscutting concepts as stated in the grade level EPEs to address moderately complex science phenomena and problems, some concrete and some abstract.

The assumptions that underlie the intended interpretations and uses of MSAA Science scores, and a summary of the evidence that supports these assumptions, are presented in Chapter 11.

1.4 Validity Arguments for the MSAA

The 2022 technical report describes several procedural and psychometric processes of the MSAA program. These processes contribute to the accumulation of validity evidence to support MSAA score

¹majority is intended as at least half or more of the science content.

interpretations and uses. This report presents documentation to substantiate the intended interpretations and uses of MSAA test scores (AERA et al., 2014). Each section in this report contributes important information about the MSAA tests: test design and development, test alignment, test administration, scoring, reliability, performance levels, and reporting. The evidence available to support validity arguments for intended MSAA test score interpretations and uses is summarized in Chapter 11.

The phrase “intended score interpretations for uses” appears several times in the *Standards for Educational and Psychological Testing* (AERA et al., 2014) and is the core of the field’s views on validity and validation. For the MSAA and other assessment programs, the phrase refers broadly to **test scores** (e.g., total test scale scores, aggregations of test scores, the percentage of students at or above Level 3), and other test performance information elements (e.g., the definition of Level 3 in the performance level descriptors). The *Standards for Educational and Psychological Testing* provides a framework for describing sources of evidence that should be considered when constructing a validity argument. These sources include evidence based on the following five areas: test content, response processes, internal structure, relationship to other variables, and consequences of testing. These sources address different aspects of supporting evidence for validity arguments; they are not distinct types of validity. Instead, each contributes to a body of evidence about the overall validity of score interpretations and uses. Moreover, these sources represent only a partial list of sources of evidence from the MSAA design, development, test administration, analysis, and reporting processes that are relevant to the overall validity arguments for intended interpretations and uses of MSAA scores and other information. Descriptions of the test development and review process and results from operational psychometric analyses (e.g., test forms equating) are other examples.

Chapter 2. History of the MSAA Science

The MSAA Science assesses grades 5, 8, and HS (3rd year of high school) and is aligned with the state content standards and the standards from *A Framework for K-12 Science Education* (National Research Council, 2012). The MSAA Science is a computer-based, on-demand assessment, consisting solely of selected-response items. The items are written at distinct levels of complexity, representing different levels of skill and knowledge acquisition by students.

Students with the most significant cognitive disabilities often need materials and instructional strategies that are substantially adapted and scaffolded, providing built-in supports to meet their individual needs. When students begin to learn a new skill or acquire new knowledge, they need more support and scaffolding. Generally, as ongoing instruction is provided and students learn and develop mastery of that skill or knowledge, they need less support.

The MSAA Science levels of complexity are designed to follow instructional practices as noted above where appropriate. The test items are developed with many scaffolds and supports embedded within the items. Students are provided additional support based on their individual requirements. The scaffolds and supports embedded with the items do not change the construct of the science concepts being assessed.

The MSAA Science is designed to be administered one-on-one, delivered in an online format or via a paper-pencil/hybrid format as an accommodation if appropriate. The needs of the student are also addressed through other supports, such as assessment features built into the platform and accommodations such as using assistive technology, a scribe, and/or sign language. The allowable accommodations and their corresponding protocols and guidelines are explained in detail in the Test Administration Manual (TAM) and must be adhered to as stated. Accommodations used during testing must also be included in the student's IEP prior to testing. Appendix A contains the 2022 summary of accommodation usage frequencies for the MSAA. TAs have substantial leeway in developing a testing schedule, including the ability to start and stop a test depending on the engagement of the student.

The MSAA Science consists of 39 operational selected-response items and 9 field-test selected-response items per grade. The assessment is administered in two test sessions.

2.1 Core Beliefs

The MSAA Science Partners believe that accessibility is central to the validity argument of the assessment, and that access to science content based on rigorous college- and career-ready academic standards is essential for a student to demonstrate what they know and can do, which leads to greater post-secondary outcomes. The original design claim highlights the high expectations that are a part of the MSAA Science. The MSAA Science design was informed by multiple stakeholder reviews to ensure inclusive accessibility and appropriately high expectations for learning. The comprehensive MSAA program was based on the same model of learning as was reflected in classroom resources and contains built-in supports and features that are appropriate to the student population that takes the assessments. In addition, MSAA Science Partners provide resources for intervention in communicative competence to ensure that all students have a way first to learn the concepts and then to show what they know and can do on the assessment.

2.2 Pre-administration Development

Work leading up to the 2022 MSAA Science operational administration began in late 2015. The work by Cognia was a collaboration between content and accessibility specialists, referred to as the Cognia development team. Additional experts in content and accessibility who were external to the Cognia development team provided various stakeholder reviews. The following table provides a summary of the work on the MSAA Science from the beginning through operational administration.

Table 2-1. Timeline for the MSAA Science Design through Administration

Activity	Purpose	Timeframe*
Claim, test design, and PLD development	Develop overarching claim that defines the outcome we expect from student performance and draft item and test design structure to elicit the desired claim. Develop policy level performance level descriptors (PLD).	Winter 2015
Priority general education PE selection and EPE development	Select prioritized general education PEs for coverage of science concepts across elementary, middle, and high school levels. Develop test blueprints for each grade level. Develop EPEs at various levels of complexity for the prioritized PEs.	Spring–Winter 2016
Stakeholder review: test blueprints, design, and draft EPEs	Convene stakeholder committee to review the test blueprints, the test design, and draft version of the EPEs. Gather feedback to refine the assessment rationale and update the EPEs.	December 2016
Refine and finalize EPEs and develop item specifications	Incorporate feedback from the stakeholder review into the EPEs. Content and accessibility specialists finalize the EPEs and draft the item specifications, including prototype/sample items.	January–March 2017
Stakeholder review: draft item specifications and prototype/sample items	Convene stakeholder committee to review a draft set of item specifications and corresponding prototype/sample items at each of the grade levels. Gather feedback to refine the item design and item specifications.	March 2017
Refine and finalize item specifications and develop items	Content and accessibility specialists complete multiple iterative rounds of refinement of the item specifications and begin item development. Following initial item development, review item specifications further and revise. Item development is ongoing.	Spring 2017 and ongoing
Stakeholder review: item content and bias-sensitivity meetings	Convene stakeholder committee to review items and provide content specific feedback as well as bias-sensitivity feedback. Occurs over multiple years as new item development happens.	September 2018 March 2021 April 2022
Field test administration	Field test administration with the MSAA Science Partners.	Spring 2021
Operational administration	Operational administration with the MSAA Science Partners.	Spring 2022

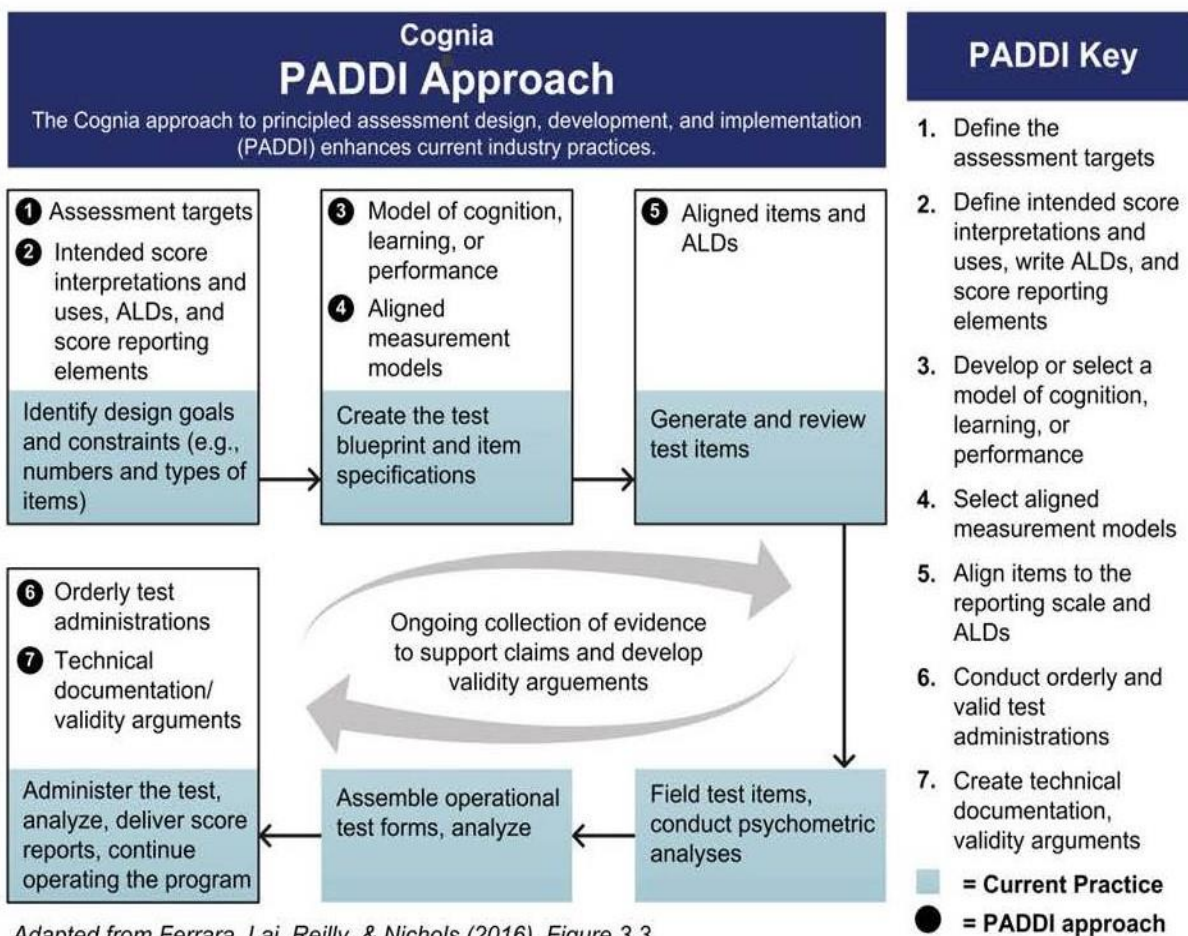

*Notably, the first operational administration of the MSAA Science was planned for the spring of 2020, but it did not occur due to school closings in response to COVID-19.

The release of *A Framework for K-12 Science Education* in 2012 provided a national focus on moving toward multidimensional science instruction that fully integrated the Science and Engineering Practices (e.g., planning and carrying out investigations) and Crosscutting Concepts (e.g., patterns) with typical science content within the Disciplinary Core Ideas (e.g., forces and motion) rather than instruction of these concepts in discrete segments. Standards based on the *Framework*, such as the Next Generation Science Standards (NGSS, 2013) or NGSS-like state content standards, weave the practices, concepts, and core ideas together through Performance Expectations (PEs). As states were developing general education assessment based on NGSS or NGSS-like standards, it was also important to develop similar alternate assessments that would allow students with significant cognitive disabilities to demonstrate their

knowledge and skills of multidimensional science concepts. The Cognia development team followed a principled assessment design process and utilized the published national resources of the *Framework* and NGSS. As outlined in Ferrara, Lai, Reilly, and Nichols (2016), “principled approaches provide concepts, procedures, and tools to guide assessment design, development, and implementation decisions” (p. 3).

Figure 2-1. Cognia’s Approach to Principled Assessment Design, Development, and Implementation

Adapted from Ferrara, Lai, Reilly, & Nichols (2016), Figure 3.3

The first steps involved developing a claim, assessment targets (e.g., test design, test blueprints), policy performance level descriptors (PLDs), and score reporting elements, followed by the selection of PEs and creation of the Extended Performance Expectations (EPEs). Research in special education, specifically focusing on students with significant cognitive disabilities, has provided models to support how learning opportunities and assessment tasks can be designed to provide evidence for inferences about what students know and what they can do across a full range of performance (Kleinert, Browder, Towles-Reeves, 2009). This research along with experience developing other alternate assessments, such as the National Center and State Collaborative (NCSC) and its continuation in the Multi-State Alternate Assessment (MSAA), provided helpful guidelines for developing the MSAA Science. Utilizing experts in both the science content area, specifically in-depth knowledge of the *Framework* and NGSS, and special education, specifically teaching students with significant cognitive disabilities, as well as psychometricians familiar with the nuances of alternate assessments, Cognia developed the science alternate assessment based on the assessment constructs and content-model definitions which assume students can learn (1)

when given the opportunity to learn multidimensional science academic standards in elementary, middle and high school grades, and (2) when the prioritized assessment constructs focus on the critical content for progressing through the grade spans with each building on the subsequent grade span and use structured scaffolds and supports that do not interfere with the measurement of the science content.

The policy PLDs were drafted with four performance levels that describe expectations of student knowledge and skills at each level based on the claim. Based on the student population and design of the assessment, it was determined reporting would be at the content-area level including scale score and performance-level designation (i.e., Level 1, Level 2, Level 3, Level 4) and the measurement model would utilize item response theory (IRT), specifically two-parameter logistic (2PL) model. Additional detailed information about reporting and IRT scaling and equating is available in Chapters 7 and 9 respectively. The following important elements guided development of the science policy PLDs and informed the selection of prioritized assessment content:

- a focus on the levels of complexity, depth and breadth, and the accuracy of understanding needed at each performance level;
- the need for scaffolds and supports for students with significant cognitive disabilities to permit independent demonstration (without changing the content being assessed);
- incorporation of multidimensional science content (core ideas, practices, crosscutting concepts) that ranges from abstract to concrete concepts; and
- the level of support, interrelated with the science content, to help distinguish the performance levels. For example, a student performing at the highest level may only need minimal scaffolding on more abstract concepts being measured, whereas a student performing at one of the mid-levels may need additional support built into the item and focused on more concrete concepts, and a student performing at the lowest level may require the additional supports along with content assessed that is focused on one dimension of the science concepts (e.g., core ideas).

The Cognia development team adhered to universal design principles and considerations related to accessibility and item features throughout the next phase of developing the MSAA Science. According to the *Standards for Educational and Psychological Testing*, tests should be designed to minimize construct-irrelevant barriers for all test takers in the target population (AERA, APA, & NCME 2014, pp. 6–7). Universal Design for Learning (UDL) seeks to optimize the accessibility of educational materials and assessments while minimizing separate-but-equal situations. To allow the widest possible range of students to demonstrate what they know and can do, and to be able to make valid inferences about the performance of all students who participate in an assessment, universally designed assessments are developed from the beginning with an eye toward maximizing fairness (Johnstone, Altman, & Thurlow, 2006). The Cognia development team applied their understanding of the characteristics of this student population and UDL principles to inform the design of each item. Their focus was to ensure that any necessary additional adaptations and accommodations did not interfere with the measured construct. A strength of the principled design approach that they followed was the support it provided for the development of items that (a) focused on construct-relevant content (the knowledge, skills, and abilities intended to be assessed), (b) minimized the impact of construct-irrelevant skills (e.g., inability to read text due to size of print, inability to access items due to absence of assistive device, inability to engage with the items), and (c) considered appropriate accessibility options (Cameto, Haertel, Morrison, & Russell, 2010, p. 1). Accessibility and assessment features of the MSAA online delivery system and structured administration guidelines were built from the foundational work of NCSC which created and adopted policies specific to accessible and flexible assessment delivery (e.g., computer-based, paper-based, or hybrid administration model, zoom, masking, etc.). These features are also part of the MSAA Science as it is part of the MSAA comprehensive program. The accessibility and item features of the item design, such as depth of knowledge, text complexity, context, and degree and type of scaffolds and supports,

were built into the item specifications so that there was a defined consistency within the item development efforts. The Cognia development team selected the PEs at each grade level based on the claim and assessment constructs that would cover a range of content knowledge in each of the science domains (i.e., Physical Sciences, Life Sciences, and Earth and Space Sciences) while being manageable for the student population and would yield reliable scores that demonstrate knowledge, skills, and understanding of the science concepts. The selected PEs mirrored the priorities for each grade level as outlined in the *Frameworks*. The EPEs developed at three complexity levels serve as varied assess points to the emphasis in the PEs. A key tenant of the *Frameworks* is multidimensional expectations. As such, the EPEs also sought to uphold that tenant. The Level 3 EPE closely resembles the multidimensional elements of the PE, with Levels 2 and 1 EPEs also maintaining multidimensional elements, when possible, for the science concept and structured in a way that builds skills from Level 1 to Level 2 and ultimately to Level 3.

Following the principled approach, to develop items that held true to the claim and content-model definitions, Cognia’s development team created detailed item specifications for each domain and grade level. The secure item specifications include:

- the Performance Expectation text and corresponding Science and Engineering Practice, Disciplinary Core Idea, and Crosscutting Concept that comprise the Performance Expectation;
- the Extended Performance Expectations (three levels) and corresponding Science and Engineering Practice, Disciplinary Core Idea, and Crosscutting Concept that comprise the Extended Performance Expectations (target and supporting, as appropriate);
- target vocabulary (terms eligible and non-eligible to be assessed at each level as well as overall expected level of vocabulary coding of the EPE by level);
- additional clarifications and assessment boundaries/content limits (additional information to consider about focus and intent of the EPE by level, as well as any limitation as to what may be assessed);
- typical stimulus elements (elements/format of the information typically presented in a stimulus for a particular EPE by level);
- sample contexts (guidance for the overall familiarity and complexity of contexts for items at that EPE by level, accompanied by several sample contexts that would be appropriate for items for that EPE);
- target Depth of Knowledge (DOK) and descriptors (provides the DOK level generally expected to be targeted for the EPE by level);
- sample stems (one or more brief examples of items aligned to each EPE by level);
- response types (types of option formats that are likely to be presented for the items);
- distractor rule (describes how related the distractors should or should not be to the stimulus);
- scoring rules (describes the number of points a student may be awarded for an item).

The assessment items incorporate important aspects of item design related to both varying levels of content complexity and the types of scaffolds and supports. Additional detailed information about the PEs, test blueprints, EPEs, and items is available in Chapter 3.

Stakeholder reviews were held at various points along the development of the MSA Science as shown in Table 2-1. According to AERA, APA, & NCME (2014), the review process should include expert judges to review items, qualifications, and relevant experiences; in addition, demographic characteristics, item review instructions, and reviewers’ training should be documented (pp. 87–88). Cognia’s development team collected evidence in support of these requirements. With each stakeholder review, a training and security protocol overview was conducted and specific materials were provided including feedback focus questions customized to the stakeholder review. The feedback was gathered by the Cognia development

team and incorporated into the various documents reviewed. A list of stakeholders who participated in the reviews can be found in Appendix B.

A stakeholder review of the assessment targets, specifically the test blueprints, selected PEs, and the alignment of the EPEs to the PEs and across EPE levels, was conducted. As noted in the Links for Academic Learning (LAL) model developed by Flowers, Wakeman, Browder, & Karvonen (2007), the alignment aspects addressed were as follows:

- Domain coverage: coverage by EPE levels for the range of prioritized PEs
- Content centrality: the focus of achievement in the EPE levels maintain fidelity with the content of the prioritized PEs
- Performance centrality: the focus of achievement in the EPE levels maintain fidelity with the specified performance of the prioritized PEs
- Depth of Knowledge (DOK): a range/progression reflected in the EPE levels and its ability to maintain fidelity to the DOK of the prioritized PE

The test blueprint domain percentages and rationale for the selected PEs was the first part of the review. Secondly, stakeholders were asked to review the alignment of the EPEs to the PEs, to confirm the selected PEs were appropriate for each grade and that there were no gaps in emphasis and if gaps were identified to provide recommendations to adjust the prioritized PEs. For the EPE review, stakeholders were asked to review for a clear progression in student understanding across the EPE levels and whether the differences in complexity between the levels were appropriate for a progression across the levels. And lastly, considering the multidimensional nature of the science, to determine whether the EPEs appropriately targeted the core ideas, practices, and crosscutting concepts. If stakeholders determined there was no link between the EPEs to the PEs, if there were gaps in the PEs selected, or if the EPEs did not meet the desired progression and multidimensional designation, then specific suggested edits were requested to be provided by the stakeholders. Overall, the stakeholders confirmed the domain coverage, content centrality, and performance centrality and provided suggestions related to the EPE levels specific to the clarity of progression from Level 1 to Level 2 to Level 3, expected difficulty, and wording choices. Feedback was incorporated by the Cognia development team.

A stakeholder review of the detailed item specifications for the grade levels and item prototypes was conducted. The reviewers were asked to focus on information within the item specifications, another alignment review of the EPEs similar to what was noted in the previous stakeholder review, and on the fidelity of the specifications on actual item prototypes. The review checklist was as follows:

Evaluate the following for each item set:	
Alignment	<p>Alignment to the NGSS standards known as Performance Expectations (PEs)</p> <ul style="list-style-type: none"> • Do the items align to the PEs? • Do the items assess the intent of the EPEs? • Are the Disciplinary Core Ideas (DCIs) integrated in each EPE item as stated? • Are the Science and Engineering Practices (SEPs) integrated in each EPE item as stated? • Are the Crosscutting Concepts (CCCs) integrated in each EPE item as stated? • Do the items align to the Item Specifications?
Item Content	<p>Content</p> <ul style="list-style-type: none"> • Is the content accurate? • Is the content consistent with NGSS intended instruction? <p>Teacher Script</p> <ul style="list-style-type: none"> • Is the language consistent? • Are the directions for the teacher clear? • Is the “Prepare PBT” and “Prepare CBT” text consistent and clear? • Are the “SAY” and “ASK” portions that are spoken to the student clear? • If there is no “SAY” text, should there be? <p>Student Response</p> <ul style="list-style-type: none"> • Is there only one correct answer listed? <p>Graphics</p> <ul style="list-style-type: none"> • Do the graphics support the content? • Are the graphics simple and free of distractions?
Complexity	<p>Depth of Knowledge (DOK)</p> <ul style="list-style-type: none"> • Do you agree with the assigned rating for DOK? <p>Presentation Rubric</p> <ul style="list-style-type: none"> • Do you agree with the assigned ratings for each component of the Presentation Rubric (Volume of Information, Vocabulary, and Context)? <p>Progression</p> <ul style="list-style-type: none"> • Is there is clear progression from Level 1 items to Level 2 items to Level 3 items? • Is there a clear progression from one grade span to the next?
Bias & Sensitivity	<p>Items should avoid Economic, Regional, Cultural, or Gender Sensitivity.</p> <ul style="list-style-type: none"> • Is the topic/content too specific to one particular state or region? • How might the topic/context affect a student who recently had a personal experience with the subject (e.g., flooding, hurricanes, or other weather events)? • Is the topic/context grade appropriate?

Feedback from the reviewers was gathered via a feedback form completed by each reviewer. In addition, a virtual meeting was held so that reviewers each had an opportunity to discuss their feedback with the Cognia development team and other reviewers. A high-level view of the feedback received focused on the following:

- clarifying the requirements of the PE and EPE;
- confirming or revising the Depth of Knowledge (DOK) designation;
- identifying any assessment boundaries;
- item progression across EPE Levels 1, 2, and 3;
- alignment;
- item clarity;
- simplifying the item when possible;
- vocabulary accessibility;
- language load for this population;
- graphics;
- confirming the correct response option is the only correct response option;
- when and where to provide graphic descriptions within the item;
- clarifications to add to the Editorial and Graphic Style Guides;
- alternate text considerations; and
- identifying any bias and/or sensitivity concerns.

The Cognia development team analyzed the item specifications feedback and the item specific feedback. Edits were incorporated in the item’s specifications, and the item prototypes were updated.

Once the item specifications were finalized following the stakeholder review, the work on developing the items began. Item Content and Bias-Sensitivity reviews were held for each development cycle where new items were created. At the start of each development cycle, the item specifications were reviewed and updated as needed based on lessons learned from previous stakeholder reviews and field-testing results. For each Item Content and Bias-Sensitivity review, reviewers were organized into grade specific panels and the following materials were provided:

- Grade level item specifications, which include the PEs and EPEs
- Review checklist
- DOK chart
- PDFs of items

Reviewers were asked to evaluate the alignment, item content, complexity, and bias and sensitivity considerations for each item reviewed. The review checklist was as follows:

Evaluate the following for each item set:	
Alignment	<p>Alignment to the PEs</p> <ul style="list-style-type: none"> • Do the items align to the PEs? • Do the items assess the intent of the EPEs? • Are the Disciplinary Core Ideas (DCIs) integrated in each EPE item as stated? • Are the Science and Engineering Practices (SEPs) integrated in each EPE item as stated? • Are the Crosscutting Concepts (CCCs) integrated in each EPE item as stated? • IF used, are Supporting Science and Engineering Practices (SEPs) and Crosscutting Concepts (CCCs) integrated in each EPE item as stated?
Item Content	<p>Content</p> <ul style="list-style-type: none"> • Is the content accurate? • Is the item scenario accessible, clear, and relevant to the student population that includes a wide range of disabilities? • Is the item text clear and succinct, avoiding words with multiple meanings and extraneous language? <p>Student Response</p> <ul style="list-style-type: none"> • Is there only one correct answer listed? • Are the response options clear, appropriate, and comparable in length? <p>Graphics</p> <ul style="list-style-type: none"> • Do the graphics support the content? • Are the graphics simple and free of distractions? • Does the alternative text (boldfaced in Item Table) provide contextual information that makes graphics accessible to students with visual impairments/blindness and the most significant cognitive disabilities? • Does the alternative text clearly align with what is represented in the corresponding graphic? <p>Item Table</p> <ul style="list-style-type: none"> • Are the “SAY” and “ASK” portions that are spoken (boldfaced) to the student clear and match the text in the stimulus? • Are the “SAY” and “ASK” portions that provide teacher directions (<i>italicized</i>) clear?
Complexity	<p>Depth of Knowledge (DOK)</p> <ul style="list-style-type: none"> • Is the assigned DOK rating appropriately represented? <p>Progression</p> <ul style="list-style-type: none"> • Is there a clear progression from Level 1 items to Level 2 items to Level 3 items?
Bias & Sensitivity	<p>Items should avoid Economic, Regional, Cultural, or Gender Sensitivity.</p> <ul style="list-style-type: none"> • Does the item content present an unfair advantage or disadvantage to any group of students? • Will the topic have an unintended impact on the student who recently had a personal experience with the subject (e.g., weather-related event, etc.)? • Is the content appropriate in terms of familiarity, interest, age, and grade? • Does the item avoid content that is offensive to any group (based on race, gender, sexual orientation, age, religion, ethnicity, socioeconomic status, or regional origin)?

The Cognia Item Content and Bias-Sensitivity facilitator recorded reviewer feedback using PDF mark-ups for each item. Consensus agreement was not necessary among all reviewers but overall agreement with feedback was sought and dissenting, or differing perspectives was noted in the PDF by the facilitator. Following the Item Content and Bias-Sensitivity review, Cognia’s development team reconciled the reviewer feedback and incorporated it into the items to prepare them for field testing.

Additional information about current stakeholder involvement and stakeholder reviews is available in the next section and Chapter 4 respectively.

2.3 Current Stakeholder Involvement

Several stakeholders are involved in the continuing development of the MSAA Science. Arizona, Maine, BIE, and USVI collaborate with Cognia on the MSAA Science. Members of this body provide input and feedback on specific aspects of the assessment. Certain activities are specific to MSAA Science, while others apply to the comprehensive MSAA program.

The MSAA Science Partners’ involvement includes participating in development planning, item reviews, post-item review committee reconciliation, and data review summaries. Input is also provided for the overall administration during test-construction form planning and reviews of the computer-based and paper-based administration materials. Specific feedback is also provided as it relates to the MSAA Science reports and their design. In addition to the MSAA Science Partners, stakeholders from schools and districts across the MSAA Science Partners participate in the field-test item development process during the item content and bias meeting. Additional detailed information is available in Chapter 4.

The MSAA Science Partners are part of the full collaborative of MSAA Partners. The MSAA Partners structure decision-making authority into various subcommittees that MSAA Partners elect to be a part of. Overall, MSAA Partners oversee development of the Test Administration Manual (TAM), MSAA Online Assessment System User Guide for Test Administrators, MSAA Online Assessment System User Guide for Test Coordinators, Parent Guides in English and Spanish, online training modules, and final quiz for TAs. Additionally, they are responsible for decisions on the overall layout of the student results files and the final processing and reporting business requirements. They oversee planning Technical Advisory Committee (TAC) meetings, contribute to psychometric decisions, provide the content of the End-of-Test Survey, determine relevant policies, receive the survey results after administration, and make recommendations on the structure of the technical report. The MSAA Partners have determined development priorities for the online assessment platform used in the 2022 comprehensive MSAA program on an as-needed basis. This group has also reviewed recommendations and development pertaining to the security of the online platform and ultimately approved all changes made to the platform.

2.4 MSAA Participation

The criteria for student participation in the 2022 MSAA Science reflects the pervasive nature of a significant cognitive disability. All content areas are considered when determining who should participate in this assessment. Table 2-2 shows the participation criteria and the descriptors used to determine eligibility for each student. Appendix C shows the 2022 summary of tested students by demographic category.

Table 2-2. Participation Criteria

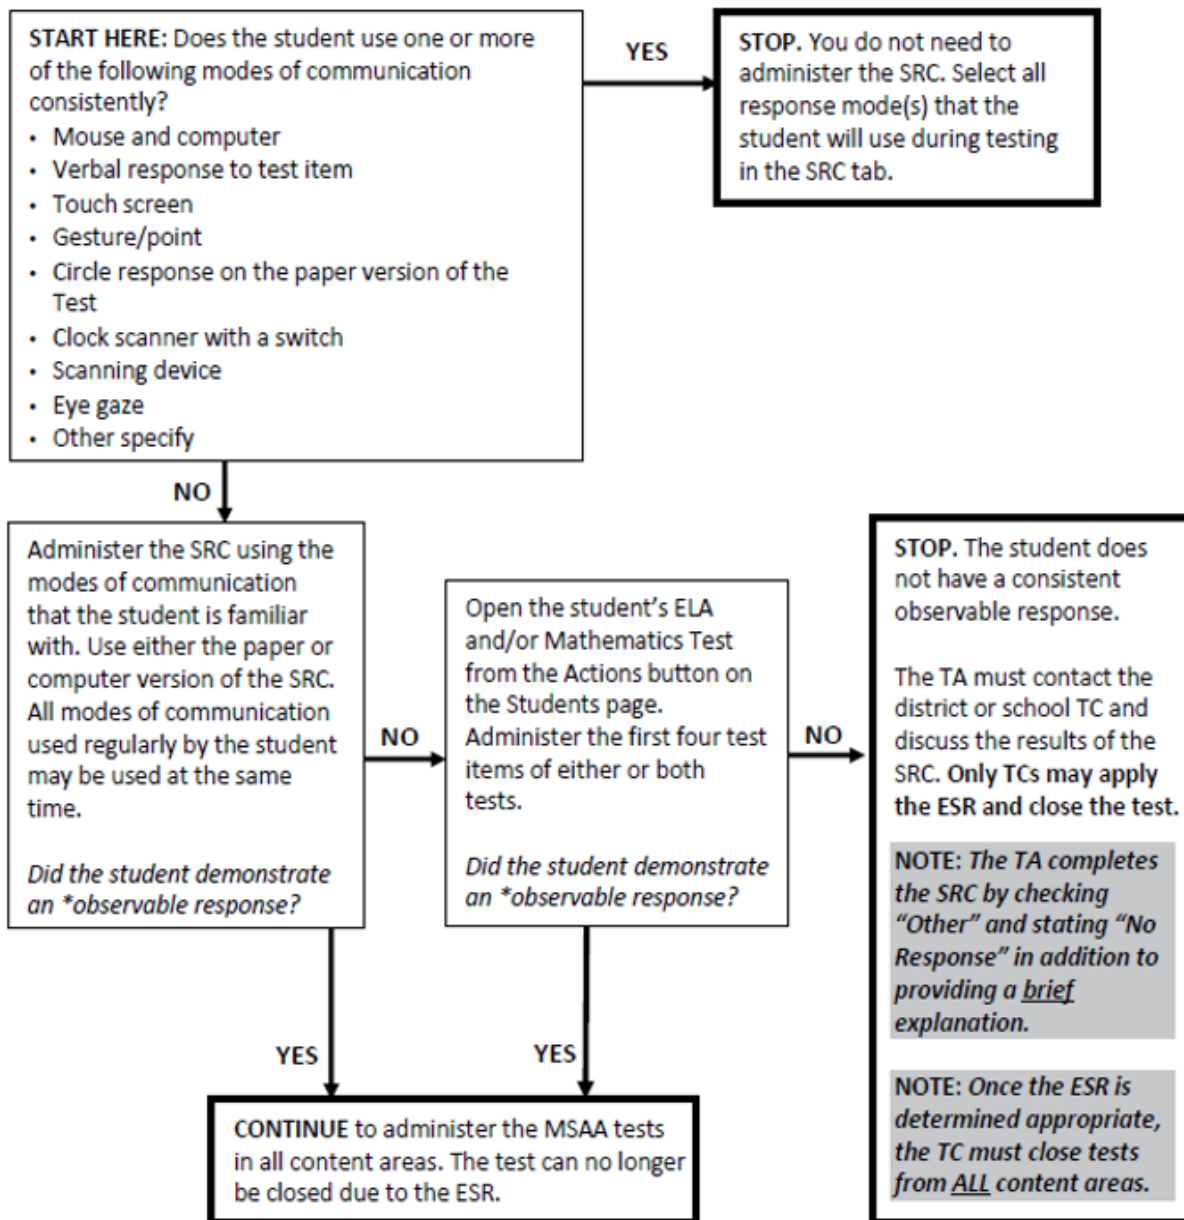

Participation Criteria	Participation Criteria Descriptors
The student has a significant cognitive disability.	Review of student records indicates a disability or multiple disabilities that significantly impact intellectual functioning and adaptive behavior.*
The student is learning content linked to grade-level content standards.	Goals and instruction listed in the individualized education program (IEP) for the student are linked to the enrolled grade-level content standards and address knowledge and skills that are appropriate and challenging for the student.
The student requires extensive, direct, individualized instruction and substantial supports to achieve measurable gains in the grade- and age-appropriate curriculum.	The student (a) requires extensive, repeated, individualized instruction and support that is not of a temporary or transient nature, and (b) uses substantially adapted materials and individualized methods of accessing information in alternative ways to acquire, maintain, generalize, demonstrate, and transfer skills across multiple settings.

**Adaptive behavior is defined as essential for someone to live independently and to function safely in daily life.*

Assessments for students with the most significant cognitive disabilities rely on a foundation of communicative competence. Students who have not yet developed consistent receptive and expressive communication are unlikely to be able to demonstrate what they know and can do on an assessment. Students who do not have a consistent appropriate mode of communication are identified during the assessment process. In order to meaningfully participate in the MSAA, students must be able to demonstrate communicative competence through an observable response mode. An observable response mode is a predictable and consistent behavior or movement that can be understood by a communication partner as intentional communication. The Student Response Check (SRC) is a task during which a student is asked to demonstrate their preferred mode(s) of communication. In these cases, the SRC aids in gathering information that is needed to determine whether there are communication barriers to meaningful participation in the MSAA assessment. If a student's responses to test items are not clearly observable or understood by the TA or scribe, the testing experience may need to be ended early. This process is called the Early Stopping Rule (ESR). In order to end the test for a student, the ESR procedures must be followed. For additional information on how the ESR data is provided to the MSAA Science Partners, districts, schools, and parents/guardians, please see Chapter 7.

Figure 2-2 shows the procedure for determining if the SRC is appropriate to administer and, if so, how to proceed in determining if the student has an observable, interpretable mode of communication in which to use throughout testing. If clear, intentional communication is not shown, the ESR may be applied. This figure shows the process of implementing the ESR.

Figure 2-2. Student Response Check (SRC) Flowchart: When to Apply the ESR

The MSAA Science Partners provide very specific training to TAs on understanding the SRC and applying the ESR. Additionally, professional development is provided to TAs through a best practice module specific to the SRC and ESR. Detailed information regarding this is available in Chapter 5.

As an additional resource, teachers can use the Communication Tool Kit developed by NCSC to help these students develop an appropriate mode of communication. The Tool Kit consists of a series of professional development modules addressing seven component parts: identifying communication, considering sensory and motor factors, selecting communication targets, selecting AAC, teaching communication targets, embedding communication into academics, and monitoring performance. The Tool Kit can be found here: https://wiki.ncscpartners.org/index.php/Communication_Tool_Kit.

Chapter 3. Test Development: Content and Administration

3.1 History of Three-Dimensional Science Standards and Extended Performance Expectations (EPEs)

The MSAA Science is aligned to and assesses academic standards for three-dimensional science standards that is appropriate for the student population. Three-dimensional science standards, such as the Next Generation Science Standards (NGSS), are based on *A Framework for K-12 Science Education* (National Research Council, 2012). Standards based on the *Framework* are complex science standards (often termed Performance Expectations, or PEs) that integrate three dimensions in each standard: Disciplinary Core Ideas (DCIs), Science and Engineering Practices (SEPs), and Crosscutting Concepts (CCCs).

The DCIs included in the *Framework* represent the science content ideas from Physical Sciences, Life Sciences, Earth and Space Sciences, and Engineering Design that are considered to be most central to science education. The writers of the *Framework* chose the DCIs for being major organizing principles of the disciplines, providing key tools for understanding or investigating more complex ideas and solving problems, and relating to the interests, personal and/or societal concerns, and life experiences of students (*Framework*, p. 31). While the *Framework* focuses on a more limited set of core ideas than past science standards did, resulting standards developed from the *Framework* still have a very large number of PEs in each grade span. To develop an appropriate science assessment for students with the most significant cognitive disabilities (SCD), the number of standards being assessed had to be further limited.

A total of 12 PEs (based on the *Framework* and the NGSS) were chosen as the focus for each grade test. In identifying these PEs, the goal was to provide reasonable representation across the DCIs and to focus on the most fundamental, broad principles that would be accessible and meaningful for this student population as a progression from elementary to middle to high school. In support of that, the selected PEs represent content from all grades in the grade band for each test. For the grade 5 test, for example, PEs from grades 3, 4, and 5 are included; the progression of standards in those grades is such that to provide a solid representation of the core ideas and understandings that students need to progress from elementary school to middle school, the PEs needed to be selected across grade bands. Likewise for the grade 8 and high school test (and even though the standards are presented as grade band in these levels), the selected PEs would typically be taught across multiple years in middle school and high school, respectively. Information regarding the history of the MSAA Science test design including stakeholder reviews is available in Chapter 2. The following Table 3-1 shows the collection of PEs chosen to be assessed on the grade 5 test.

Table 3-1. Selected Performance Expectations for Grade 5 Test

Performance Expectation (PE)	DCI	SEP	CCC
5-PS1-2. Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.	PS1.A–Structure and Properties of Matter PS1.B–Chemical Reactions	Using Mathematics and Computational Thinking	Scale, Proportion, and Quantity
3-PS2-2. Make observations and/or measurements of an object’s motion to provide evidence that a pattern can be used to predict future motion.	PS2.A–Forces and Motion	Planning and Carrying Out Investigations	Patterns
5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.	PS2.B–Types of Interactions	Engaging in Argument from Evidence	Cause and Effect
4-PS3-4. Apply scientific ideas to design, test, and refine a device that converts energy from one form to another. *	PS3.B–Conservation of Energy and Energy Transfer PS3.D–Energy in Chemical Processes and Everyday Life ETS1.A–Defining and Delimiting an Engineering Problem	Designing Solutions	Energy and Matter
5-PS3-1. Use models to describe that energy in animals’ food (used for body repair, growth, and motion, and to maintain body warmth) was once energy from the sun. ¹	PS3.D–Energy in Chemical Processes and Everyday Life	Developing and Using Models	Energy and Matter
4-LS1-1. Construct an argument that plants, and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.	LS1.A–Structure and Function	Engaging in Argument from Evidence	Systems and System Models
3-LS3-1. Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms.	LS3.A–Inheritance of Traits LS3.B–Variation of Traits	Analyzing and Interpreting Data	Patterns
3-LS4-1. Analyze and interpret data from fossils to provide evidence of the organisms and environments in which they lived long ago.	LS4.A–Evidence of Common Ancestry and Diversity	Analyzing and Interpreting Data	Scale, Proportion, and Quantity
5-ESS1-2. Represent data in graphical displays to reveal patterns of daily changes in the length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.	ESS1.B–Earth and the Solar System	Analyzing and Interpreting Data	Patterns
3-ESS2-1. Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.	ESS2.D–Weather and Climate	Analyzing and Interpreting Data	Patterns
5-ESS2-1. Develop a model using an example to describe ways in which the geosphere, biosphere, hydrosphere, and/or atmosphere interact.	ESS2.A–Earth Materials and Systems	Developing and Using Models	Systems and System Models
5-ESS3-1. Obtain and combine information about ways individual communities use science ideas to protect the Earth’s resources and environment.	ESS3.C–Human Impacts on Earth Systems	Obtaining, Evaluating, and Communicating Information	Systems and System Models

*PEs marked with an asterisk incorporate Engineering constructs.

¹This PE crosses Physical Sciences and Life Sciences. It will be classified in Life Sciences in fulfilling the blueprint distribution.

For the grade 5 test, PEs were chosen from grades 3–5 to generate the best representation of broad, fundamental principles for the elementary grade assessment. Because the NGSS spread science topics

out across grades in the 3–5 grade band, there are some key content ideas for forces and motion, as well as for heredity, biological evolution, and weather, that only appear in standards at grade 3. Although the test is targeted for administration to students in grade 5, the following four grade 3 PEs were included to ensure focus on all foundational areas that students would need exposure to, to prepare for middle school expectations:

- 3-PS2-2 focuses on basic patterns of motion, as a foundation of the cause-and-effect exploration of forces and motion. This PE also provides an opportunity to expose students to the various types of forces, from physical contact forces to gravity and magnetism, linking to another motion/forces PE within elementary and to other motion/forces PEs in later grades.
- 3-LS3-1 introduces the fundamental principle of inheritance of traits (traits passed from parents to offspring) as well as the idea of variation, which are both cornerstones of the study of genetics and biological evolution.
- 3-LS4-1 provides an accessible foundation for thinking about evidence of organisms' fit to the environment, and changes in organisms and environments over time.
- 3-ESS2-1 focuses on the most foundational understandings of weather, which are then extended in other elementary PEs and in later grades in studying interactions of Earth's systems, geoscience processes changing Earth's surface, water cycling through Earth's systems, and the larger concept of climate.

It should also be noted that while the chosen PEs may seem to lean more toward Physical Sciences than Life Sciences (5 PEs coded to Physical Sciences and only 3 PEs coded to Life Sciences), PE 5-PS3-1 is a “crossover” PE that connects the physical science concept of energy in everyday life with the life science concept of matter and energy flow. Although 5-PS3-1 has a physical science coding, it would typically be taught within an ecology unit (and is therefore classified as a Life Science PE in the test blueprint).

Additionally, it may be noted that there are no PEs in the elementary grade test for Physical Sciences DCI PS4, Waves and Their Application in Technologies for Information Transfer. The concept of waves is abstract and is therefore viewed as more appropriate to address in the grade 8 test than in this grade band for students with significant cognitive disabilities. Likewise in Life Sciences, although no performance expectation is explicitly aligned to DCI LS2 (Ecosystems: Interactions, Energy, and Dynamics), PE 5-PS3-1 overlaps heavily with these concepts. All other DCIs are represented in the elementary grade test. Additional detailed information regarding the rationale of PE selections for all grades is provided in Appendix D.

As PEs were selected and finalized for each grade band, the progression of DCIs was checked to help validate the appropriateness of the collection of PEs chosen for assessment on each grade's test. The following tables show an example of the final prioritized PEs and associated DCIs for the Physical Sciences across grades 5, 8, and HS.

Table 3-2. Selected Performance Expectations for Physical Sciences Across Grades 5, 8, and HS

Grade	Performance Expectation (PE)	DCI
5	5-PS1-2. Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.	PS1.A PS1.B
	3-PS2-2. Make observations and/or measurements of an object's motion to provide evidence that a pattern can be used to predict future motion.	PS2.A
	5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.	PS2.B
	4-PS3-4. Apply scientific ideas to design, test, and refine a device that converts energy from one form to another.*	PS3.B PS3.D ETS1.A
8	MS-PS1-2. Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred.	PS1.A PS1.B
	MS-PS2-2. Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.	PS2.A
	MS-PS3-5. Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.	PS3.B
	MS-PS4-2. Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.	PS4.A PS4.B
HS	HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.	PS1.A PS1.B
	HS-PS2-3. Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.*	PS2.A ETS1.A ETS1.C
	HS-PS2-5. Plan and conduct an investigation to provide evidence that an electrical current can produce a magnetic field and that a changing magnetic field can produce an electrical current.	PS2.B PS3.A
	HS-PS3-2. Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative positions of particles (objects).	PS3.A

*PEs marked with an asterisk incorporate Engineering constructs.

Table 3-3. DCI Coverage for Physical Sciences Across Grades 5, 8, and HS

	Physical Sciences Disciplinary Core Idea (DCI) Coverage Across Grades												
	PS1.A	PS1.B	PS1.C	PS2.A	PS2.B	PS2.C	PS3.A	PS3.B	PS3.C	PS3.D	PS4.A	PS4.B	PS4.C
Grade 5	X	X		X	X			X		X			
Grade 8	X	X		X				X			X	X	
Grade HS	X	X		X	X		X						

Ultimately, the selected PEs within and across grades represent a content progression supporting essential learning and understandings in the Physical Sciences. The constructs of structure and properties of matter, chemical reactions, forces and motion, types of interactions, and conservation and transfer of energy are all well-represented across the grade bands. Additionally, basic understanding of waves and their behavior is included in grade 8.

The representation of SEPs and CCCs across the selected PEs was also reviewed to ensure most, if not all, SEPs and CCCs were included for each grade test. Likewise, one or two engineering-aligned PEs were included in the selected PEs for each grade test, as engineering constructs are included in the *Framework* as both SEPs and DCIs. As can be seen in Table 3-1 for the grade 5 test, the selected PEs incorporate seven of the eight SEPs and five of the seven CCCs (with the other two CCCs not actually included in the elementary grade band in NGSS standards). There is also one engineering-aligned PE included, 4-PS3-4. Additional detailed information regarding the final prioritized PEs and associated DCIs for the Physical Sciences, Life Sciences, and Earth and Space Sciences across all three grades is provided in Appendix D.

Prior to the start of item development, the Extended Performance Expectations (EPEs) were created. The EPEs are the standards developed to define academic grade-level content that is clearly linked to *Framework*-defined grade-level content, but at reduced complexity, breadth, and depth appropriate for students with significant cognitive disabilities. These EPEs represent the assessable grade-level content for the MSAA Science.

3.1.1 Extended Performance Expectations (EPEs)

Each selected general education PE has been extended into three access points to create the EPEs. The operational items vary in complexity following those three access levels of the EPEs. The highest access point, Level 3, is intended to closely mirror the general education PE and represents the most cognitively demanding target for this student population. The Level 3 EPE is three-dimensional and aligned to the same three dimensions (DCI, SEP, and CCC) as the general education PE. However, the Level 3 EPE typically has a slightly lower cognitive demand than the general education PE. For example, the EPE may limit the number or types of examples that students will be expected to connect to the construct. Depending on the particular EPE and the phenomenon or context chosen for assessing the EPE, some items may not encompass all parts of the EPE, particularly if it has multiple examples/contexts listed. All Level 3 items will, however, align to all three dimensions and the essence of the EPE.

The other two access points, Level 2 and Level 1, have been written as progression points that students would likely move through as they build proficiency towards the Level 3 EPE. Level 2 and Level 1 EPEs are therefore intended to provide a scaffold for instruction and learning by supporting students in the attainment of the target knowledge and skills expressed in the Level 3 EPE. All Level 2 EPEs are two-dimensional, occasionally three-dimensional. All Level 1 EPEs are one-dimensional (DCI), occasionally two-dimensional. This allows instruction and learning to be appropriately focused and scaffolded in a logical, accessible sequence towards the complex expectation of integrating multiple facets of science (DCI, SEP, and CCC) in the target performance.

Additionally, in evaluating alignment to the DCI in Level 1 items, and some Level 2 items, alignment is achieved through the use of the vocabulary and examples/contexts matching the DCI. For this population of students, simply being able to process the words and context of the DCI to answer the item is evidence of engagement with and use of DCI knowledge. Regarding the SEP and CCC, the Level 2 (and Level 1, if two-dimensional) access point may align to an SEP and/or CCC other than the ones in the general education PE and Level 3 EPE. The rationale for this is two-fold: first, this approach mirrors best practices for classroom instruction on three-dimensional science and supports an emphasis on including all SEPs and CCCs, not just select ones, over the course of instruction; and second, this approach allows a scaffolded progression towards proficiency to be developed for each EPE, rather than trying to differentiate nuances of the *degree* to which a student is demonstrating a singular target learning outcome.

For an example of the EPEs, along with an explanation of the major layout components, please see Appendix D.

3.2 Alignment and Linkages

Evidence that the test content reflects the concepts that were meant to be measured is one of the critical sources of information necessary to support valid interpretations of test scores (AERA et al., 2014). *Alignment* refers to coherent connections within and across a system (Forte, 2013a, 2013b). Traditional alignment procedures describe the degree of intersection, overlap, or relationship among academic content embedded in state content standards, assessment, and instruction (Webb, 2005).

As part of the assessment development process, ACS Ventures, LLC (ACS) conducted an external independent study to evaluate the alignment of the MSAA Science for grades 5, 8, and HS in fall 2022. ACS used the Links for Academic Learning (LAL) alignment method developed by the National Alternate Assessment Center as the basis to conduct the content alignment review and analyze the results (Flowers et al., 2007). ACS adapted this method to best fit the MSAA Science data analysis needs. In addition to the LAL alignment questions, ACS also conducted supplementary analysis to confirm the EPEs to the designated dimensions (i.e., DCI, SEP, CCC). Overall, the study was designed to answer several key questions related to the alignment of the assessment. The alignment questions were:

1. What degree of *content centrality* is maintained between the items and the EPEs? (LAL Criterion 3)
2. What degree of *performance centrality* is maintained between the items and EPEs? (LAL Criterion 3)
3. Are there an adequate number of items representing each domain on the science alternate assessment test form (i.e., domain concurrence)? (LAL Criterion 4)
4. Does the collection of the science alternate assessment items represent multiple EPEs within each domain of the blueprints (i.e., range of knowledge)? (LAL Criterion 4)
5. Does the balance of representation indicate similar emphasis of science alternate assessment items as the blueprint? (LAL Criterion 4)
6. Is there a range of cognitive levels across the content of the science alternate assessment items and do the levels reflect fidelity with the cognitive levels in the EPEs? (LAL Criterion 4)
7. Is there a change in emphasis of age-appropriate content across grade levels (i.e., differentiation)? (LAL Criterion 5)
8. Is the content accessible to students with varying levels of communicative competence? (LAL Criterion 7)

The LAL method is appropriate for alignment of the EPEs to the corresponding general education PEs. The supplementary analysis is appropriate given the MSAA Science is intended to address multidimensional science concepts to address DCI, SEP, and CCC.

The MSAA Science items were designed to assess the knowledge and skills of a wide variety of students with the most significant cognitive disabilities, and the findings of the alignment study supported this. The grade level items were rated as well aligned for both content centrality and performance centrality, meaning at least 90% of items were judged as having *some* or *all* the same performance expectations of the EPEs. Domain concurrence for each grade level was rated as well aligned, meaning at least 90% of the items on the test form align to an EPE defined in the blueprint, no item on the test form reflects expectations not defined in the grade level, and each of the domains in the blueprint is represented by items on the form. The range of knowledge and balance of representation for each grade level was rated as well aligned. The reviewed items compared to the blueprint, EPEs, and point emphasis were varied for each domain represented (i.e., Physical Sciences, Life Sciences, and Earth and Space Sciences). The

study also confirmed there is a range of cognitive complexity represented across the three levels in each grade. Differentiation across grade levels was rated as well aligned for all grade levels indicating an increased breadth and depth of the content. The alignment study results provided evidence that the assessment items allow access for students consistently using various communication modes and with specific characteristics. Panelists indicated that the accommodations and allowable modifications as defined in the TAM were accessible or somewhat accessible. For students that do not yet have clear, intentional communication even at the non-symbolic level, the assessment doesn't have a way to capture responses. These students would go through the SRC as defined in the TAM and likely have the ESR applied as an appropriate assessment procedure. Panelists indicated that the TAM clearly defined the accommodations, modifications, and supports allowed for standardized administration procedures. Additionally, the panelists confirmed strong alignment to the dimensions (i.e., DCI, SEP, CCC) providing evidence that the science content meets the multidimensional concepts as intended. The alignment study report is available by contacting the MSAA Science Partners at MSAA@azed.gov.

3.3 2022 MSAA Science Assessment Design

3.3.1 Operational Design and Administration

The operational MSAA Science is designed to produce valid and reliable scores for the intended uses. MSAA Science is composed of selected-response items, each with three response options. The assessment is developed and administered in item sets over two sessions. Item sets consist of three items, aligned to the three access levels of the Extended Performance Expectations (EPEs). The low-level item (Level 1) is administered first, the medium-level item (Level 2) is administered second, and the high-level item (Level 3) is administered third, and then a new set of items begins (as shown in Figure 3-1). There are also a small number of clusters, which contain two item sets (of three items each) bundled together with a single shared stimulus, to create a more integrated, performance task-like experience for the students.

Figure 3-1. Linear Administration of Item Sets

For the 2022 assessment, one form with two sessions was developed. The form follows guidelines informed by the test blueprint (the test blueprint is discussed in Section 3.4). The operational items are presented in Session 1 and the field-test items are presented in Session 2.

Figure 3-2. Linear Test Design

3.3.2 Operational Items and Field-Test Items

As discussed earlier, there is one form for each grade. As shown in Table 3-4, the test administers 39 operational items in Session 1. The test also administers 9 field-test items in Session 2. The test has 48 items total per grade.

Table 3-4. Operational and Field-Test Items

Grade	Total Operational Items Administered to Each Student	Total Field-Test Items Administered to Each Student	Total Number of Items Administered to Each Student
5	39	9	48
8	39	9	48
HS	39	9	48

The 2022 operational items were selected to adhere to the content blueprints for the test, which has established targets for the percentage of items administered in each science domain (Physical Sciences, Life Sciences, and Earth and Space Sciences).

The 2022 field-test items were selected based on the following criteria:

- they represent a variety of item complexity levels;
- they provide a variety of content; and
- the items are engaging, accurate, and free of regional bias.

The items on each of the forms are reviewed by Cognia’s psychometricians for any validity and reliability concerns. The *AY22 Test Construction Process* provides the procedures to follow in constructing the test including the psychometric parameters that form the criteria each constructed test should meet. This document is used as the guiding resource to replicate MSAA test construction processes across administration years. The test construction process occurs following data review of the field-test items from the previous administration. Cognia’s content specialists create the test forms based on the test blueprints and criteria provided by the psychometricians. The form is then evaluated by the psychometricians and revision loops occur as needed. Once the psychometricians provide approval of a constructed test it is then also reviewed by the MSAA Science Partners. All constructed tests, as well as the field-test items, are posted on a secure FTP site for the MSAA Science Partners’ review. A webinar is held with the MSAA Science Partners to explain the test construction process and to review the Test

Construction Design document, which provides information about the items selected. The MSAA Science Partners then have an opportunity to provide input on these decisions.

Following the 2022 test administration, the psychometric team conducted a post-equating check for all science items. It is assumed that due to the newness of the science test and continued pandemic effect, some operational items fell below the psychometric thresholds to be considered acceptable items. After discussing this with the MSAA Science Partners, a decision was made to use field-test items to replace these operational items for scoring purposes, with the goal to increase the overall reliability of the test. A detailed procedure is documented in chapter 9.

3.3.3 Item Design

The MSAA Science item design and administration is intended to capture student performance at different levels of skill and knowledge acquisition. The assessment items incorporate important aspects of item design related to both varying levels of content complexity and the degree and type of scaffolds and supports.

The MSAA Science content development process addresses levels of cognitive and language complexity, specifically addressing the state content standards, and the heterogeneous characteristics of the target student population. The assessment items vary systematically in complexity yet remain aligned with the EPEs. The items are designed to capture student performance by varying two characteristics: (1) levels of content complexity, and (2) degrees and types of scaffolds and supports. The scaffolds and supports are provided to focus the student on the task and elicit a response without guiding the student's response. The scaffolds and supports are built into the item design for each level of each EPE. The items include the scaffolds and supports that the students are presented with and the DTAs include scripts and specific directions on how the TA is to provide these supports. Building them into the items themselves ensures the supports are being provided consistently to all students who take the test.

The science item specifications for each standard reflect the three item complexity levels. A primary distinction among items written at item complexity levels 1–3 is (a) their connection to content standards, and (b) the scaffolded supports provided at each level.

- Complexity level 3 items target the Level 3 EPE, with minimal supports provided during item administration.
- Complexity level 2 items target the Level 2 EPE, with content supports (e.g., simplified language) provided during item administration.
- Complexity level 1 items target the Level 1 EPE, with content supports (e.g., graphics, simplified language) and item supports (e.g., two response options are non-plausible).

3.3.3.1 Overall Item Structure

A range of item levels is developed for each EPE, as described in Section 3.1.1 and the introduction to this Section 3.3.3. Each level provides variable features and supports that offer multiple entry points for a variety of students to demonstrate their knowledge and skill. All items are currently selected-response items worth one point each. Selected-response items consist of a stimulus (optional), a stem, and three options. Details related to each are outlined in the item specifications.

- Stimulus: The amount of information to be contained in the stimulus/scenario for an item is detailed in the item specifications, specifically in Volume of Information. Level 1 items may or may not contain a stimulus. Level 2 and Level 3 items will almost always contain a stimulus.

- Stem: The item or question stem asks the student a question that elicits a response. Stems are phrased in a way that is open to any response mode so that students can indicate the answer in any way that works for them. Thus, the stem is presented so that it is response-neutral.
- Options: Only one answer option (key) is correct. Rules for distractor options vary depending on the level of the item.
 - Level 1 items typically will have two irrelevant distractors, meaning that the distractors are completely unrelated to the context presented, or the distractors relate to some element of the stimulus/context but do not include words, pictures, or phrases closely linked to the correct answer. (In rare situations, distractors at Level 1 may be related to the stimulus. These include contexts in which a student is asked to identify a part of a model. In this case, one of the distractors may be a second part of the model that is not the key. Another exception occurs when a student is asked to distinguish between two opposing conditions, such as sunny and cloudy or dry and wet. One of the distractors can be the condition opposite the key.) Level 1 options will often contain a word plus a graphic to illustrate (often symbolically) the meaning of that word. However, this will not be necessary in all instances. Options are parallel in construction; for example, equal in level of detail (e.g., graphic options) or equal in length (e.g., sentence/phrases, same number of syllables). Alternatively, if text options are all different lengths, they may be ordered from least to greatest length.
 - Level 2 items typically will have one irrelevant distractor and one distractor related more closely to the information found in the stimulus. (In rare cases where a data table does not lend itself to an outlier distractor, all response options may come from the data table.)
 - Level 3 items will have two distractors more closely related to information found in the stimulus.

3.3.3.2 Variable Features and Supports

The MSAA Science has a variety of features and supports incorporated into the item specifications for each EPE that allow for multiple entry points and varying degrees of complexity throughout an item set. The three main categories of development that have parameters at each level to ensure a progression of access points include the following:

- Volume of Information (VI): varying amounts of information to be presented in the scenario, ranging from no scenario to complex scenarios that include three or more sentences with extensive information.
- Context: varying degrees of complexity with contexts across item levels, ranging from familiar and immediate settings to unfamiliar and abstract contexts.
- Vocabulary: varying degrees of familiarity with vocabulary presented ranging from very familiar everyday words to complex and abstract content-related vocabulary.

The tables shown in Appendix E provide detailed information specific to each level of these variable features and supports.

3.3.4 Item Components

3.3.4.1 Selected-Response: Science

All directions and materials needed for administering selected-response items are provided in the secure grade-, content-, and form-specific DTA. Selected-response items are presented to students in a standardized and consistent format. Items are presented in two ways:

1. Standalone item sets

- Each set contains three items (Level 1, Level 2, Level 3) authored to be a single EPE progression.
- Items are independent of one another; each item includes its own stimulus text and optional graphic.
- Each item is presented in the following order: item stimulus, item stem, three response options.

2. Cluster item sets

- Each cluster contains one shared stimulus and six items; three items authored to one EPE progression and three items authored to a second EPE progression.
- Items are independent of one another, but are all related to the shared stimulus science context.
- Each cluster is presented in the following order: the shared stimulus (text and optional graphics); Level 1, Level 2, Level 3 items authored to the first EPE progression; Level 1, Level 2, Level 3 items authored to the second EPE progression. Each individual item repeats key information and graphics from the shared stimulus, presents the item stem, and then presents three response options.

For all items, students may select a response from the options in a variety of ways (e.g., using the computer mouse, verbalizing, gesturing, using eye gaze or communication devices, using assistive technology). Students' responses are entered into the MSAA test-taking system. If a student has the scribe accommodation, the scribe enters the student-selected response on behalf of the student.

3.4 Content and Blueprints

The test blueprints followed by MSAA Science are consistent with the evidence-centered design process undertaken to develop the summative assessment and with best practices in educational measurement.

Because the Framework only defines three or four DCIs in each content domain, and because of the small number of standards being targeted for the MSAA Science (n=12 per grade), four standards per content domain were chosen as the targets for each grade's assessment.

In translating the distribution of content across 13 item sets, however, we could not weight each content domain equally and therefore chose to reflect the content emphases of NGSS and many state Framework-based standards for each grade band. The table below shows the content blueprint for the operational test for each grade band. The test blueprint for each grade in Appendix F incorporates the overall content distributions used for the development of the operational tests. As noted in Chapter 2, the content distributions in the blueprints was reviewed by various stakeholders and serves as the basis for the current MSAA Science content assessed at each grade level.

Table 3-5. Blueprint for Distribution of Science Content by Grade Level

Science Content Category	Gr 5	Gr 8	HS
Physical Sciences	~40%	30–40%	30–40%
Life Sciences	~30%	30–40%	30–40%
Earth and Space Sciences	~30%	~30%	~30%

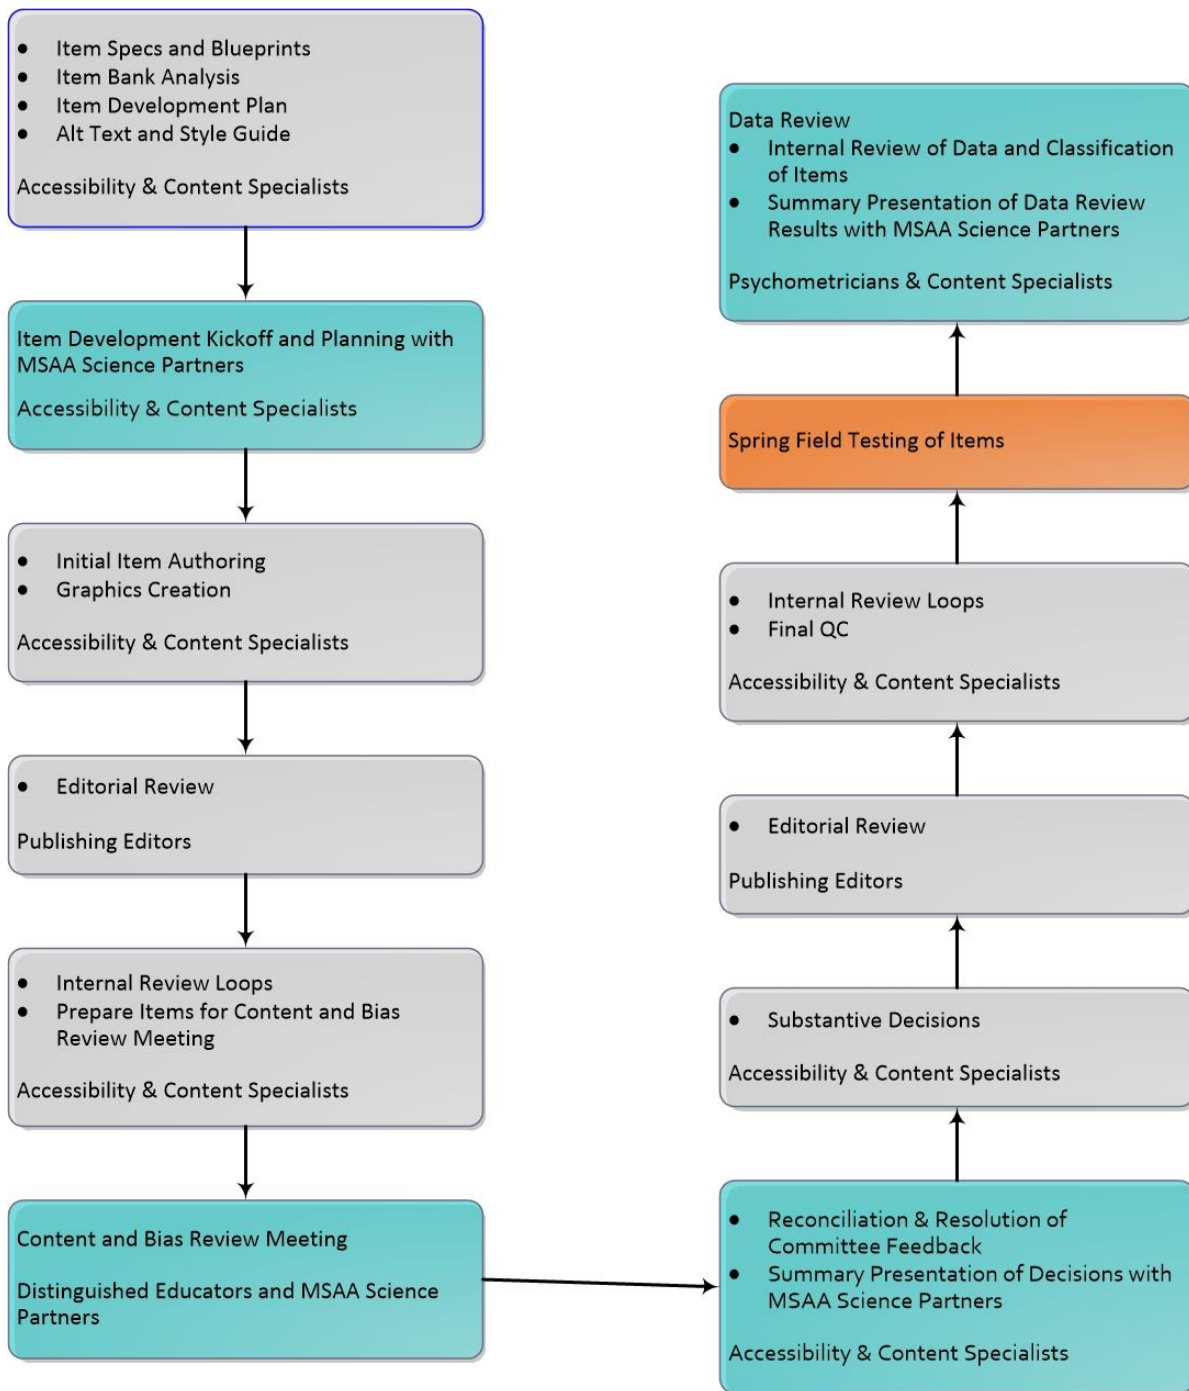

Chapter 4. Test Development: Stakeholder Involvement

4.1 General Philosophy and Role of the MSAA Science Partners and Other Stakeholders in Test Development

As discussed previously, the MSAA Science is part of a comprehensive MSAA program designed to promote increasingly higher academic outcomes for students with the most significant cognitive disabilities in ELA, mathematics, and science in preparation for a broader array of post-secondary outcomes. The MSAA Science is designed to assess the academic content of the EPEs through an assessment design that consists of items written at various levels of complexity and provides built-in supports to meet the individual needs of the students. The assessment allows students to demonstrate what they know and what they can do. Given the wide diversity of the student population, emphasis is placed on ensuring that the MSAA Science is appropriate and accessible to all eligible students.

The MSAA Science items on the 2022 administration are from the previous MSAA Science 2021 field-test administration. In 2021 the MSAA Science was administered for the first time in Arizona and Maine only. The 2022 administration was the first administration of MSAA Science that had operational items. As described in Chapter 3, the items selected as field-test items are developed by Cognia. The item development process is an iterative one, which allows for multiple opportunities for review of the items by various internal stakeholders including content experts, accessibility specialists, and editors. The items also have an opportunity to be reviewed by external stakeholders including the MSAA Science Partners and content experts from the field who participate as panelists in an item content and bias review meeting. Items that are newly developed are field tested during the spring administration. Once they are field tested, the items undergo data analysis and then go through a data review process with internal stakeholders including psychometricians and content experts as well as the MSAA Science Partners. Figure 4-1 provides a flowchart outlining the item-development process.

Figure 4-1. Item Development Process*

* The gray boxes represent work that happens internally at Cognia, the teal boxes represent stakeholder (educators and/or MSAA Science partners) involvement, and the orange box represents administration.

The content and bias review meeting consists of three groups, broken out by grade level, who review the items for content alignment, bias and sensitivity considerations, and accessibility considerations. The list of participants in the item content and bias review is included in Appendix B. Cognia provides overall direction and guidance regarding field-test item development, and the MSAA Science Partners have an

opportunity to provide input during the Item Development Kickoff. This multistage development and review process provides ample opportunity to evaluate items for their accessibility, appropriateness, and adherence to the principles of Universal Design. In this way, accessibility serves as a primary area of consideration throughout the item development process. This focus on accessibility is critical in developing an assessment that allows for the widest range of student participation, as educators seek to provide access to the general education curriculum and foster higher expectations for students with the most significant cognitive disabilities.

Internal stakeholders participate in the data review meeting and are responsible for making determinations about the future usage of the items based on the field-test and operational statistics. During the internal data review meeting(s), Cognia psychometricians, content specialists, and accessibility specialists review the Calibration Report, which includes item statistics for each field-test item that has been flagged by Psychometrics. This year, since it was the first administration with operational data, the operational items were also calibrated and any operational items that were flagged by psychometricians were also reviewed. The criteria used for both operational and field-test items are $a \leq .25$ or $b.se > .30$. During the internal data review, flagged items are placed into categories. The items might be flagged as Do Not Use (DNU) or flagged as Use with Caution (UWC). The content of the item is reviewed along with the statistics. After each flagged item is reviewed, the internal stakeholders determine whether an item is eligible for usage, rejected (DNU), or designated as revise and re-field test. Rationale is captured for each flagged item as to why the determination was made as such. Additionally, items with strong statistics are reviewed by the content and accessibility specialists with an eye toward what is working for the item and the EPE it is aligned to. This information is used when reviewing the flagged items and making a determination toward designation and is also considered in the new field-test item development process.

The items deemed eligible for usage are considered part of the operational item pool and may be selected during the test construction process. The items that are designated as rejected and designated as revise and re-field test do not become part of the operational pool.

The statistics that trigger an item to be flagged are shared with the MSAA Science Partners during a Data Review Summary Meeting. Referenced during data review are the item response theory (IRT) analyses summarized in the Field Test Calibration Report (see Section 9.2 for field test calibration details). The MSAA Science Partners are also supplied with Asset Detail Reports, which provide the actual item sets and/or clusters for each of the flagged items. This step allows for the content of the flagged items to be considered when determining future usage.

The MSAA Science Partners also have an opportunity to review and provide input on the constructed tests. As noted previously, this activity occurs following data review. All constructed tests, as well as the field-test items, are posted on a secure FTP site for the MSAA Science Partners to review and provide input. A webinar is held with the MSAA Science Partners to explain the test construction process and to review the MSAA Test Construction Process for 2022 document, which provides information specific to each content area about the items selected. The MSAA Science Partners then have an opportunity to review and provide input.

Chapter 5. Training and Administration

5.1 Test Administrator and Test Coordinator Training

The MSAA Science Partners adhere to the premise from the testing standards (AERA et al., 2014) that a key consideration in developing test administration procedures and manuals is that test administration should be fair to all examinees. When all Test Administrators (TAs) utilize the same well-defined administration procedures and the provided training, manuals, and supporting documents, administration is prescribed, standardized, and poised to be fair to all examinees. Test Coordinators (TCs) are directly responsible for supporting TAs in understanding and following the administration procedures. Comprehensive TC training and materials targeted to their role and responsibility ensure that they are appropriately prepared to support the TAs.

As explained previously, the MSAA Science is part of the comprehensive MSAA program, as such the training, manuals, and supporting documents provide both comprehensive and content specific information to TAs and TCs. Given the MSAA Science is a computer-administered test, the administration procedures are consistent with the hardware and software requirements of the test specifications. The MSAA Science requires completion of training by all TCs and TAs to support standardized test processes and procedures. MSAA provides ancillary testing materials each year outlining specific practices and policies including (a) the Test Administration Manual (TAM); (b) MSAA Online Test Administration Training; (c) the MSAA Online Assessment System User Guide for Test Administrators; (d) the MSAA Online Assessment System User Guide for Test Coordinators; and (e) grade-specific Directions for Test Administration (DTA). The online training and the supporting documents are comprehensive and prescriptive, but also provide clear information on where and how much flexibility a TA has while administering the MSAA Science. TCs and TAs receive both the online training and the supporting documents to ensure fidelity of implementation and the validity of the assessment results as well as to help MSAA prevent, detect, and respond to irregularities in academic testing and maintain testing integrity practices for technology-based assessments.

5.2 Test Administrator Training Modules

The online training modules for TAs are available prior to the beginning of the testing window and throughout the testing window. The training modules are customized to address the specific responsibilities of the TA and to provide important information from the three documents TAs are required to use: the (1) TAM, (2) DTA, and (3) *MSAA Online Assessment System User Guide for Test Administrators*. These training modules were updated for the 2022 administration in correspondence with the updates to the required documents. There are seven modules (see Table 5-1). Each module requires approximately 15–30 minutes to complete.

Table 5-1. Training Modules for Test Administrators

Module 1: MSAA Overview
Module 2: Navigating the MSAA Online Assessment System
Module 3: Test Administrator and Test Coordinator Responsibilities
Module 4: The Writing Prompt
Module 5: Accessibility Features and Accommodations
Module 6: Student Response Check and Early Stopping Rule
Module 7: Science Module

TAs are required to view the training modules (accessed through the MSAA System) in sequence and to successfully complete a final quiz after viewing all modules. Each module must be viewed, and the corresponding quiz must be successfully completed before the link for the subsequent module becomes accessible.

Questions pertaining to information in the module follow each online training module for TAs. These questions are included as a review of the content to prepare TAs for the final quiz. TAs must obtain a score of 80% or higher on the final quiz to be certified to access the secure test administration materials. If TAs do not fulfill this certification requirement, they are not allowed access to the secure test materials. The TAs are notified within the MSAA System whether they pass the final quiz. TAs are allowed multiple attempts to obtain a score of 80% or higher on the final quiz.

The Science Module includes additional context about the EPEs, the science item sets and how they align with EPEs, information about clusters, information specific to the layout of the MSAA Science DTA and items, which varies slightly from the ELA and mathematics contents for the MSAA test, and strategies for preparing students prior to testing. The Science Module has quiz questions at the end of the module to assess learning, but there are no questions in the final quiz that pertain to information specific to the Science Module.

In addition to the module training, TAs are instructed to become familiar with the online system by accessing sample items. In addition to the sample items, which were developed by content and measurement experts for teachers, administrators, and policymakers, the MSAA Science added sample items for the 2022 administration that are representative of current MSAA Science item development. The sample items do not address all assessed content at each grade level. Rather, the sample items provide a preview of the array of items and illustrate multiple item features that allow students with a wide range of learner characteristics to interact with the assessment process.

5.3 Test Coordinator Training Modules

Online modules specific to the role of TCs are made available both before and during the testing window. These training modules are customized to address the specific responsibilities of the TCs and to provide important information from the documents TCs are required to use: the (1) TAM and (2) *MSAA Online Assessment System User Guide for Test Coordinators*. Like the TA training modules, the TC training modules are updated based on the revisions made to the required documents. There are seven modules; each of which runs 20–25 minutes (see Table 5-2).

Table 5-2. Training Modules for Test Coordinators

Module 1: MSAA Overview
Module 2: Navigating the MSAA Online Assessment System
Module 3: Test Administrator and Test Coordinator Responsibilities
Module 4: The Writing Prompt
Module 5: Creating and Managing Users and Classrooms
Module 6: Student Response Check and Early Stopping Rule
Module 7: Science Module

TCs are required to view the online training modules (accessed through the MSAA System) in sequence. Each module must be viewed before the link to the subsequent module becomes accessible. There are quiz questions at the end of each module as a review of the content of that module. TCs are required to complete the online training but not required to take a final quiz.

5.4 Best Practice Videos

The best practice videos are accessed through the MSAA System and provide TAs with targeted information about the MSAA. Video 1 focuses on (1) reviewing assessment features that are available within the MSAA online system, (2) how to go to full screen mode and zoom within the browser, and (3) procedures to follow when using the hybrid approach to administration (i.e., both online and paper-pencil formats). Video 2 focuses on the purpose and steps of conducting the student response check (SRC) and on how to implement the early stopping rule (ESR). (See Table 5-3).

Table 5-3. Best Practice Videos

Video 1: How to Administer an Item
Video 2: How to Administer the SRC and Implement the ESR

5.5 Test Administration Manual

The Test Administration Manual (TAM) provides an overview of, and the guidelines for, planning and managing the MSAA administration for district and school personnel. Additionally, the TAM defines the roles and responsibilities of the TA, TC, and State MSAA Coordinator, all of whom are involved in and oversee the administration of the MSAA. It is organized according to the following tasks:

- providing an overview of the MSAA and the required documents (i.e., TAM, DTA, MSAA Online Assessment System User Guide for Test Administrators, MSAA Online Assessment System User Guide for Test Coordinators);
- defining the roles and responsibilities of the TA and TC, as well as training requirements;
- providing an overview of test designs, item specifics, and content-specific information;
- describing the accessibility features for both online and paper administration as well as the allowable accommodations (i.e., assistive technology, paper version, scribe, sign language); and
- providing detailed information about how to maintain test security and what constitutes a test irregularity.

The TAM also contains a vocabulary list for all content areas, appendices for scribe accommodation and sign language accommodation protocols, the procedures for annotations, and guidelines regarding the use of augmentative and alternative communication by students taking the MSAA. The TAM is accessible to TAs and TCs through the MSAA System and is made available prior to the beginning of the testing window, as well as throughout the testing window.

5.6 Directions for Test Administration (DTA)

The secure grade-, content-, and form-specific DTAs are required to be used by TAs when administering the MSAA Science. Each DTA is accessible through the MSAA System once a TA has been certified. The DTAs are required to be used by the TA for MSAA administration. The elements provided as part of each DTA include standardized directions and scripts that must be followed exactly as written for each item, including alternative text as appropriate.

While the TA has some flexibility in presentation and response mode to ensure the MSAA Science is accessible to a student, the DTAs are designed to provide standardization to ensure a TA is not changing what is being measured.

5.7 Test Coordinator and Test Administrator User Guides

The *MSAA Online Assessment System User Guide for Test Coordinators* and *MSAA Online Assessment System User Guide for Test Administrators* provide technical information and troubleshooting tips, plus step-by-step instructions for navigating the MSAA System. Each user guide contains specific information relevant to the role of the TA and the TC. The user guides provide many screenshots that demonstrate the functionality of the MSAA System. The user guides also contain appendices that describe accessibility features, assistive technology compatibility, and the MSAA System technology requirements.

As with the TAM, the user guides are accessible to TAs and TCs through the MSAA System and are available prior to the beginning of the testing window, as well as throughout the testing window.

5.8 Operational Administration

The administration window for the MSAA Science was March 14–April 29, 2022. Regardless of administration format (i.e., online or paper), the student assessments are submitted electronically by the TA on or before April 29, 2022. The MSAA Science is not a timed test. Testing time varies for each student, with testing paused and resumed based on a student's needs. If a student becomes sick or exhibits frustration, lack of engagement, or refusal to participate during the administration of the MSAA Science, TAs are directed to pause the testing and take a break, which can last for a few minutes or a few days, depending on the student's needs. The MSAA Science protocols allow the TA to pause and resume the administration of the test as often as necessary during the testing window, based on a student's needs.

Throughout the administration window, monitoring and quality control processes are ongoing. Support is provided to TCs and TAs through the MSAA Service Center, additional supports built into the MSAA System functionality, and the MSAA Science Partners. TA feedback is gathered through an end of administration test survey. Review of the service center logs and analysis of the test survey results inform the MSAA Science Partners about areas where clarification and further support is needed.

5.8.1 MSAA Service Center

To provide support to schools before, during, and after testing, Cognia operates and provides tiered technical support through the MSAA Service Center. The MSAA Service Center is available year-round from 6:00 a.m. to 10:00 p.m. EST, Monday through Friday, to accommodate the multiple time zones in which the test is administered.

The TAM directs TAs and TCs to contact the MSAA Service Center with questions pertaining to the MSAA System and test administration procedures. The MSAA Service Center's toll-free support number,

e-mail address, and chat link are disseminated to the field through the MSAA System and related communications.

Functionally, support is provided in a tiered manner where Tier 1 support involves direct support to the caller by MSAA Service Center representatives; Tier 2 support includes support by the program management team for items such as policy questions; and Tier 3 support applies to technical requests, which are escalated to the technology vendor for attention.

All activity is tracked in the new MSAA Service Center ticketing system, ServiceNow, and is included in weekly status reports that are provided to MSAA Science Partners. These reports summarize ticket activity, call analysis data (e.g., call duration, hold time), and per-grade/content and per-state test status summaries throughout the administration window.

5.8.2 Additional Supports

In addition to the MSAA Service Center, the Cognia program management team periodically provides direct phone and e-mail support where logistical or procedural support is needed by MSAA state representatives. In cases of Partner specific policy questions, program management refers the individual to the appropriate MSAA Science Partner for support and resolution of the question.

The MSAA System also has a banner messaging system that can be used as needed to communicate updates to the field, whether providing reminders about upcoming important key dates, advanced notice of planned schedule maintenance, or known system issues being experienced. The banner messaging offers color-coding based on severity/importance (e.g., red for high severity; yellow for low severity; and blue for informational). When the messaging system is activated, a banner message appears at the top of the screen upon login to notify users of system information and upcoming system activities, such as known issues and scheduled system maintenance, as well as upcoming test administration deadlines.

5.8.3 Monitoring and Quality Control

To ensure that proper testing procedures and appropriate test practices are maintained throughout administration, numerous measures are taken both to communicate participants' responsibilities and to monitor the appropriateness, accuracy, and completion of key procedures and tasks. The TAM outlines the procedure for reporting any violation or suspected violation of test security or confidentiality by notifying the school or district TC. TCs are then instructed to follow state procedures regarding reporting the issue or suspected issue; however, district TCs are informed that they must report to the State MSAA Coordinator any incidents involving alleged or suspected violations that are considered serious irregularities. The TAM further explains that the consequences for inappropriate test practices are determined by the individual state's professional codes of ethics and state law.

The online MSAA System contains built-in measures to ensure proper testing procedures, as seen in the session-based test design. When the TA clicks the *Next* button on the last question of Session 1, a prompt appears notifying the TA that he or she has reached the end of the session and asks the TA to click Next when ready to start Session 2. When the student responds to the last item in Session 2, a prompt appears notifying the TA that he or she has reached the end of the test, displaying the number of answered items, and allowing the TA to review the current session, submit the test, or save and exit the test.

Figure 5-1. End of Test Prompt

If the TA clicks the *Save & Exit* button, the test will resume the next time on the last item answered. If the TA clicks the *Submit My Test* button, the test is submitted and cannot be re-opened. This prompt reduces the risk of users accidentally submitting a test without properly understanding the implications.

Throughout the administration window, Cognia monitors activity and provides weekly updates to the MSAA Science Partners on the test statuses and on trends identified in support calls. These updates provide a mechanism for concerns to be identified early and the appropriate measures to be taken, such as the creation of assessment-wide or state-level materials and communications. This high level of communication and collaboration throughout the assessment process contributes to a proper and valid administration of the MSAA Science.

5.8.4 Operational Test Survey Results

An End-of-Test Survey (EOTS) allows MSAA to gain knowledge from the experience of each TA administering the test. TAs are instructed to complete at least one EOTS after completing test administration for all their students. The EOTS is administered for all content areas that are assessed. The MSAA Science Partners use the survey to gather feedback from a general program perspective. The survey questions focus on several themes:

- technology use in the classroom,
- student behaviors and engagement,
- instructional time spent on academic content, and
- learning model.

The results of the EOTS highlight several areas of concern that the MSAA Science Partners had identified prior to reviewing the survey data. The data support continued work in the following areas:

- increasing student engagement,
- monitoring the available technology in classrooms to ensure the platform is up to date for compatibility, and
- providing professional development to support effective instructional and test-administration strategies.

One issue raised by the teachers in the EOTS data is a lack of continuity between instruction and assessment. The MSAA Science Partners focus on providing professional development to improve instructional practices and to clarify administration policies that increase student engagement by utilizing strategies that align with instruction and still allow for a standard administration.

Several questions on the survey address teachers' viewpoints and philosophies regarding teaching students with the most significant cognitive disabilities. The results again indicate the need for professional development that builds awareness and use of the available instructional and curricular materials, which illustrate various ways that students in this population have access to rigorous academic content.

Furthermore, responses from TAs regarding the high level of difficulty of the test reveal that many students are not fully engaging with the assessment. Individual comments regarding engagement suggest the need for professional development in preparing students for testing. Professional development efforts should make use of the best-practice videos to highlight administration strategies.

The EOTS data also show that many students are using a variety of Augmentative and Alternative Communication (AAC) devices to access the test. In addition, most of the responses indicate that students use desktop computers, laptops, and tablets in the classroom with and without AAC devices and that devices and browsers are compatible with the test. However, some responses indicate that the students in these classrooms either do not utilize or have no access to electronic devices outside of testing. This valuable information can be used to gauge the impact of limited prior exposure to computers on student engagement with the online test.

Chapter 6. Scoring

6.1 Selected-response Item Scoring Processes

6.1.1 Overview of Scoring Process Within the System and Test Administrator Training

Overview of Scoring Process Within the Assessment System

The MSAA System provides automated machine scoring for all the science items. The selected-response item types were described in detail in Chapter 3. The student may provide their responses to the items within the MSAA System. The system also allows for teacher entry of student responses for paper-based test delivery. The selected-response items are scored according to the answer keys provided in each test package.

All item responses are exported from the system and are provided to the Cognia Information Technology Reporting (IT-Reporting) Department. The exported items go through a key verification check to confirm that the selected-response item keys were entered correctly. A key verification check is conducted by the data analyst. Any items that may be flagged are provided to the content specialists, who conduct a blind key check. The content specialists review the actual item and mark the key in the flagged file. Any mismatches are researched by the content specialist, and updates are made following a problem item notice process to update and correct the key. In cases where no mismatches are found, the content specialist notifies the data analyst, and the file is released for final processing.

Items are scored in the MSAA testing system as correct or incorrect, with each of them contributing a score of 1 or 0 to the content-area raw score. Non-responses (blank responses) to any item are scored as 0 points. Detailed score assignments and the comprehensive data analysis requirements are provided in the MSAA Assessments Reporting Services Deliverables Decision Rules document, which can be reviewed in Appendix G.

Test Administrator Training and Support

All TAs must participate in training modules and pass a final quiz to be certified to administer the MSAA, as described in detail in Chapter 5. During the test administration, TAs use the grade-, content-, and form-specific DTAs to administer each item. With the MSAA Science, there are no occurrences where the TA must score an item as they are all selected-response items.

The *MSAA Online Assessment System User Guide for Test Administrators* provides further direction to TAs on entering item responses in the MSAA System. The guide outlines the use of the system, including how to enter student responses and submit each content-area test.

For support related to the administration, entry of student responses, and submission of student responses during the administration window, TAs can call or e-mail the MSAA Service Center.

Chapter 7. Reporting

7.1 Development and Approval of Report-Specific Documents

To ensure that reported results for the MSAA Science are accurate relative to collected data, the *Reporting Services Deliverables Decision Rules* document delineating processing rules is prepared, edited in collaboration with the MSAA Reports Subcommittee, and then approved by all participating MSAA Science Partners prior to processing of the results. The processing and reporting business requirements and participation status structure provide the framework for the reporting requirements, which are defined for each unique report and similarly edited in collaboration with the MSAA Reports Subcommittee. The *Reporting Services Deliverables Decision Rules* are then approved by the MSAA Reports Subcommittee prior to reporting. This document includes all content areas that are part of the comprehensive MSAA program.

The *Reporting Services Deliverables Decision Rules* document contains the hierarchy by which the participation statuses are assigned for each individual test, incorporating data elements collected by the test platform and directly from the MSAA Science Partners. The reporting requirements and corresponding report design templates were developed by Cognia with the guidance of the MSAA Reports Subcommittee. Both documents underwent iterative review processes that included draft reviews by the appropriate subcommittee, incorporation of edits, draft reviews by all participating MSAA Science Partners, subcommittee review, and integration of feedback, until final revisions were approved by all participating MSAA Science Partners.

Creating the Report Design Templates

Cognia worked with the MSAA Reports Subcommittee in combination with the MSAA Science Partners to develop the report design templates based on existing report designs that would ensure that the data elements, layout, and report text were meaningful for reporting the spring 2022 MSAA Science results. Once finalized, the results of this collaborative process were presented to participating MSAA Science Partners for final approval.

MSAA 2022 Guide for Score Report Interpretation

Cognia uses an iterative process to annually update the *Guide for Score Report Interpretation* (see Appendix H) with the MSAA Reports Subcommittee. Updates are made to ensure that the guide provides the most helpful information to district and school staff as they review reports for their own knowledge and as they discuss the reports with parents or guardians. The guide includes an overview of the MSAA, student participation criteria, score reporting overview, and samples of the various types of reports available to schools and districts. Guidelines inform the interpretation and utilization of MSAA scores. The guide also includes explanations for all special reporting codes and messages, as well as performance-level scale score ranges. Partners are permitted to remove codes not used in their state. Appendices included in this guide contain a sample individual student report and the writing prompt scoring rubrics. The final, approved *2022 MSAA Guide for Score Report Interpretation* is delivered electronically to the MSAA Science Partners for state-specific revisions and distribution.

7.2 Specific Primary Reports Generated for Schools, Districts, and States

Cognia, in collaboration with the MSAA Reports Subcommittee and the MSAA Science Partners, reviews and updates the following primary reports annually:

- Student reports
- School and district roster reports
- School, district, and state summary reports

Reports are generated for each school, district, or state that has results, as defined by the MSAA processing and reporting business requirements and reporting requirements. These reports, along with student results data files, are posted online via the MSAA Online Assessment System’s secure data and reporting portal. As determined by the MSAA Science Partners, only Test Coordinators (TCs) are granted access to the online reports. Access is controlled by user-permissioned accounts, as illustrated in Table 7-1.

Table 7-1. Report/File Availability by Role

Reports	State	Test Coordinator	
		District	School
Student	Yes	Yes	Yes
School Roster	Yes	Yes	Yes
District Roster	Yes	Yes	No
School Summary	Yes	Yes	Yes
District Summary	Yes	Yes	No
State Summary	Yes	No	No
Data Files	State	Test Coordinator	
		District	School
School	Yes	Yes	Yes
District	Yes	Yes	No
State	Yes	No	No

For the purposes of the assessment system, MSAA Science Partners are regarded as State TCs. As such, they can add new district and school TCs to the online system and block from the system any users no longer in the TC role. For 2022, these reports were provided in October to schools, districts, and parents due to the standard setting occurring.

The primary results reported are the student’s scale score and performance-level classification for science. The performance-level classifications, with cut scores determined through the original standard setting process (see Chapter 9 for more information), are reported under the generic labels, Level 1, Level 2, Level 3, and Level 4. Level 4 is the highest attainable performance level.

The average scale score and the percentage of students in each performance level are summarized by school, district, and state on both the roster and summary reports. These summaries allow for the comparison of individual student performance to overall state performance, as well as comparison of school and district results with the overall state results.

7.2.1 Student Report

The student report is a two-sided, single-page document generated for each student eligible to receive a performance level, as defined by the student report requirements. The report contains science results and

was developed for parents and guardians of students who participated in the MSAA Science. Reports are organized by school and posted via the secure-access portal for authorized users to download, print, and disseminate to parents and guardians. Each report contains the student name, test grade, and school on the front of the report. The back page contains the student name, state student ID, school, and test grade. Sample student reports are included in the *MSAA 2022 Guide for Score Report Interpretation*.

Page 1 of the report contains the scale score, performance level, and associated performance-level descriptor for the level obtained by the student. A sentence below the graphical display explains the standard error of measurement (SEM) in an easy-to-understand manner by providing the expected range of scores the student would likely earn if tested again.

Page 2 contains a brief overview of the MSAA Science, including examples of some of the built-in supports available during testing, and highlights the compatibility of the assessment with various modes of communication. Parents and guardians are encouraged to discuss with their child's teacher the supports their child used on the MSAA Science.

Tests for students unable to show a consistent observable mode of communication are closed using the Early Stopping Rule, and the lowest scale score is assigned and displayed along with the Level 1 performance level. This is annotated, and in place of the Level 1 performance-level descriptor, the following text is displayed: *Your child did not show a consistent observable mode of communication during the test, and the test was closed by the teacher. Since your child did not complete the test, the results may not be an accurate representation of your child's skills. If you have additional questions, please contact your child's teacher.*

7.2.2 School Roster Report

The school roster report is organized at the school level and provides a by-grade list of all students enrolled in the MSAA Science, with a snapshot of their participation/test status and results. The number of tested students, the average scale score, and the percentage of students at each performance level are summarized for the school, district, and state at the top of the roster. The processing and reporting business requirements and roster report requirements identify which of the participation status codes are included on the roster and which of the participation test status codes are included in each calculation.

The summary information at the top of the school roster report supports interpretation of results by users, typically those at the school and district levels. Given that many schools have a relatively small number of students in this population, the MSAA Science Partners do not suppress information when the number of students participating is small. This practice places an added responsibility on users to understand the data in the context of small numbers and to use all the provided information to understand the results, as explained in the *MSAA 2022 Guide for Score Report Interpretation*.

Student results are listed below the summary section and are identified by name and by state student identification number. It is intended that these data points be used in conjunction with the *MSAA 2022 Guide for Score Report Interpretation*. The following student-level elements are reported:

- Participation/Test Status
- State Compare (comparison to state average)
- Scale Score
- Performance Level

7.2.3 Summary Reports

Summary reports for the MSAA Science are organized at the school, district, and state levels for each entity with at least one student included in summary report calculations. Inclusion in these calculations is defined by the processing and reporting business requirements and summary report requirements. The following information is summarized by grade and displayed for the school, district, and state based on the level of the report:

- Enrolled (number of students enrolled)
- Tested (number of valid student tests)
- Did Not Test (number of enrolled students who did not test)
- Average Scale Score
- Performance Level (number and percentage at each performance level by grade in the state, district, and school)

This summary provides a comparative snapshot of results and participation information at a high level and includes both participation and performance summary information, allowing users to evaluate both aspects of their assessment results as guided by the *MSAA 2022 Guide for Score Report Interpretation*.

7.2.4 Quality Assurance

Quality-assurance measures at Cognia are embedded throughout the entire process of data capture, analysis, and reporting. The data processors and data analysts who work on the project implement quality-control checks of their respective computer programs. Moreover, when data are handed off to different teams within the IT-Reporting Department, the sending team verifies that the data are accurate prior to handoff. Additionally, when a team receives a data set, the first step is to verify the data for accuracy.

A second level of quality-assurance measurement is parallel processing. One data analyst is responsible for writing all programs required to populate the student and aggregate reporting tables for the administration. Each reporting table is assigned to another data analyst on staff who uses the processing and reporting business requirements to independently program the reporting table. The production and quality-assurance tables are compared, and only after 100% agreement is attained are the tables released for report generation.

The third aspect of quality control at Cognia involves the Software Quality Assurance (SQA) team, which works together with the data processing and data analysis teams to ensure quality data is captured and delivered accurately. Quality control checks are being performed by the data processors and data analysts as the data are handed off via multiple internal software tools. These quality checks initialize the accuracy of the data being ingested into the database and subsequent tables/columns. SQA develops a test plan that includes previously agreed upon report designs and decision rule documents. Test cases housed in an internal test cases repository are then executed in a process including, but not limited to, the following steps:

1. Testing data counts of data imported.
2. Testing data quality of individual fields for valid values, such as Gender, Ethnicity, etc.
3. Validating scripts developed by the software developers to ensure that they match business requirements and technical specifications.

In this testing effort to ensure the quality of the data, the SQA team uses a sample of schools and districts selected based on multiple criteria, such as:

- Unique student testing records
- Students complete testing
- Students partially completed testing
- Invalidated students

Working with the data processing and data analysis teams allows for timely and precise turnaround if any data anomalies are found. To allow full transparency and cohesive teamwork in data validation, test cases are tied to tickets outlining required work.

Finally, the SQA team executes test cases validating student printed reports in comparison to the previously agreed-to report design specifications. Once all the test cases have passed, the SQA team notifies the Cognia State Services team for final sign-off and communication.

Chapter 8. Preliminary Statistical Analyses

A complete evaluation of a test's quality must include an evaluation of each item. Both *Standards for Educational and Psychological Testing* (AERA et al., 2014) and *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004) include standards for identifying quality items. Items should assess only knowledge or skills that are identified as part of the domain being tested and should avoid assessing irrelevant factors. Items should also be unambiguous and free of grammatical errors, potentially insensitive content or language, and other confounding characteristics. In addition, items must not unfairly disadvantage students, particularly racial, ethnic, or gender groups.

Both qualitative and quantitative analyses are conducted to ensure that MSAA Science items meet these standards. Qualitative analyses are described in chapters 3–6 of this report; this chapter focuses on quantitative evaluations. Statistical evaluations are presented in three parts: (1) classical statistics, (2) differential item functioning (DIF) statistics, and (3) dimensionality analysis of inter-item correlations. The item analyses presented here are based on the administration of the MSAA Science in spring 2022.

8.1 Classical Difficulty and Discrimination Indices

All items are evaluated in terms of item difficulty according to standard classical test theory practices. Difficulty is defined as the average proportion of points achieved on an item and is measured by obtaining the average score on an item and dividing it by the maximum possible score for the item. Selected-response items are scored dichotomously (correct versus incorrect); for these items, the difficulty index is simply the proportion of students who correctly answered the item (p -value). A p -value index of 0.0 indicates that all students received no credit for the item; an index of 1.0 indicates that all students received full credit for the item.

Items that are answered correctly by almost all students provide little information about differences in student abilities but do indicate knowledge or skills that have been mastered by most students. Similarly, items that are correctly answered by very few students provide little information about differences in student abilities but may indicate knowledge or skills that have not yet been mastered by most students. In general, to provide the best measurement, difficulty indices should range from near-chance performance of 0.25 (for four-option selected-response items) to 0.90, with most items generally falling between approximately 0.3 and 0.7 for all science grades. However, on a standards-referenced assessment, it may be appropriate to include some items with very low or very high item difficulty values to ensure sufficient content coverage.

A desirable characteristic of an item is for higher-ability students to perform better on the item than lower-ability students do. The correlation between student performance on a single item and total test score is a commonly used measure of this characteristic of the item. Within classical test theory, the item-test correlation is referred to as the item's discrimination because it indicates the extent to which successful performance on an item discriminates between high and low scores on the test. For selected-response items, the corresponding statistic is commonly referred to as a point-biserial correlation. The theoretical range of these statistics is -1.0 to 1.0, with a typical observed range from 0.2 to 0.7.

A summary of the item difficulty and item discrimination statistics for each grade is presented in Table 8-1. The mean difficulty and discrimination values shown in the table are within typically observed ranges.

Please note that high school has only 37 items instead of 39 due to the limitation from the science item pool.

Table 8-1. 2021–22 MSAA Science: Summary of Item Difficulty and Discrimination Statistics by Grade

Grade	Number of Items	<i>p</i> -value				Discrimination			
		Min	Max	Mean	SD	Min	Max	Mean	SD
5	39	0.33	0.72	0.53	0.10	0.22	0.56	0.38	0.10
8	39	0.32	0.80	0.49	0.12	0.14	0.53	0.35	0.11
HS	37	0.31	0.75	0.46	0.10	0.12	0.49	0.32	0.09

Note that the classical statistics should be interpreted with caution because the items are three-option selected-response items. Because the items were developed to correspond to different levels, the item statistics have been summarized by level (Table 8-2). Although items tend to be harder for Level 3 than Level 2, and harder for Level 2 than Level 1, the relative difference is much greater when comparing the Level 1 items to the other levels than it is among Levels 2 and 3. Due to the limitation of the science item pool, the number of items at each level were not exactly 13 items as intended for grade 8 and HS.

Table 8-2. 2021–22 MSAA Science: Item-Level Classical Test Theory Statistics—Summary by Grade and Level

Grade	Level	Number of Items	<i>p</i> -value				Discrimination			
			Min	Max	Mean	SD	Min	Max	Mean	SD
5	1	13	0.49	0.72	0.62	0.06	0.33	0.56	0.49	0.06
	2	13	0.36	0.69	0.50	0.09	0.27	0.47	0.35	0.07
	3	13	0.33	0.57	0.47	0.07	0.22	0.44	0.30	0.06
8	1	13	0.43	0.80	0.60	0.12	0.22	0.53	0.43	0.08
	2	12	0.36	0.66	0.47	0.10	0.24	0.46	0.35	0.07
	3	14	0.32	0.52	0.41	0.06	0.14	0.42	0.27	0.10
HS	1	13	0.43	0.75	0.54	0.09	0.30	0.49	0.39	0.06
	2	13	0.31	0.64	0.43	0.09	0.17	0.45	0.30	0.09
	3	11	0.32	0.46	0.40	0.04	0.12	0.32	0.25	0.06

8.2 Differential Item Functioning

The *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004) explicitly states that subgroup differences in performance should be examined when sample sizes permit and that actions should be taken to ensure that differences in performance are due to construct-relevant, rather than irrelevant, factors. Chapter 3 of *Standards for Educational and Psychological Testing* (AERA et al., 2014) includes similar guidelines. As part of the effort to identify such problems, MSAA Science items were evaluated in terms of DIF statistics.

For the 2021–22 MSAA Science, the standardization DIF procedure (Dorans & Kulick, 1986) was employed to evaluate subgroup differences. The standardization DIF procedure is designed to identify items for which subgroups of interest perform differently, beyond the impact of differences in overall achievement. The DIF procedure calculates the difference in item performance for two groups of students

(at a time) matched for achievement on the total test. Specifically, average item performance is calculated for students conditional on scale score. Then an overall average is calculated, weighting by the pooled scale score distribution so that it is the same for the two groups.

When differential performance between two groups occurs on an item (i.e., a DIF index in the “low” or “high” categories, explained below), it may or may not indicate item bias, e.g., caused by construct-irrelevant factors. Other construct-relevant reasons could also lead to DIF, such as course-taking patterns or differences in school curricula. On the other hand, if subgroup differences in performance can be traced to differential experience (such as geographical living conditions or access to technology), the inclusion of such items should be reconsidered.

For the 2021–22 MSAA Science, four subgroup comparisons were evaluated for DIF:

- Male compared with Female
- White compared with Black
- White compared with Hispanic
- Not economically disadvantaged status compared with economically disadvantaged

The DIF statistics were calculated based only on the members of the subgroup in question in the computations; values were calculated only for subgroups with 100 or more students. The tables in Appendix I present the number of items classified as either “low” or “high” DIF, overall and by group favored. Computed DIF indices have a theoretical range from -1.0 to 1.0 for selected-response items. Dorans and Holland (1993) suggested that index values between -0.05 and 0.05 should be considered negligible. The preponderance of the MSAA Science items fell within this range. Dorans and Holland further stated that items with values between -0.10 and -0.05 and those with values between 0.05 and 0.10 (i.e., “low” DIF) should be inspected to ensure that no possible effect is overlooked, and a list of low DIF items are listed in Appendix I, and that items with values outside the -0.10 to 0.10 range (i.e., “high” DIF) are more unusual and should be examined very carefully; thus, content experts conducted a review of items flagged for DIF.

The number of items with a “high” DIF index for each level (the cognitive complexity of the item; refer to information in Chapter 3 for further detail regarding the levels) is shown in Table 8-3. Since an item can exhibit DIF for multiple comparisons, an item was counted once if any of the comparisons showed “high” DIF. Table 8-3 shows that only one item was classified as “high” DIF. These results indicate that the content bias reviews for science were conducted thoroughly. For the one item in high school science that shows high DIF, the Cogna content development team will examine the item prior to the next operational use.

Table 8-3. Number of Items with “High” DIF by Level

Grade	Level 1	Level 2	Level 3
5	0	0	0
8	0	0	0
HS	1	0	0

8.3 Dimensionality Analysis

Because tests are constructed with multiple content-area subcategories, and their associated knowledge and skills, the potential exists for several dimensions being invoked beyond the common primary dimension. Generally, the subcategories are highly correlated with each other; therefore, the primary dimension they share typically explains an overwhelming majority of variance in test scores. In fact, the

presence of just such a dominant primary dimension is the psychometric assumption that provides the foundation for the unidimensional item response theory (IRT) models that are used for calibrating, linking, scaling, and equating the MSAA operational tests.

The purpose of dimensionality analysis is to study test item responses for evidence of violations of test unidimensionality and, if such evidence is found, to understand what it is telling us about possible multidimensionality. In practice, the most common approach is to look for statistically significant violations of local independence (LI), also known as local item dependence (LID). Because LID (i.e., violations of LI) can occur for reasons other than multidimensionality, if evidence of LID is found, the next step is to study the LID to determine its source (or sources), including the possibility of multidimensionality. Hence, we first conducted hypothesis tests to detect statistically significant LID. If it was found, we: (a) estimated the size of the LID and (b) studied the nature of the LID with particular emphasis on possible multidimensionality. Findings from dimensionality analyses performed on the 2021–22 MSAA operational science items are reported below. (Note: Only operational items were analyzed since they are used for score reporting.)

The dimensionality analyses were conducted using the nonparametric IRT-based methods DIMTEST (Stout, 1987; Stout et al., 2001) and DETECT (Zhang & Stout, 1999). Both methods use as their basic statistical building block the estimated average conditional covariances for item pairs. A conditional covariance is the covariance between two items conditioned on expected total score for the rest of the test, and the average conditional covariance is obtained by averaging across every possible conditioning score. When a test is strictly unidimensional, all conditional covariances are expected to take on values of zero, indicating statistically independent item responses for examinees with equal expected total test scores. Nonzero conditional covariances are essentially evidence of LID, which often implies multidimensionality. Thus, nonrandom patterns of positive and negative conditional covariances are indicative of LID which may imply multidimensionality.

DIMTEST is a hypothesis-testing procedure for detecting LID. The data are first divided into a training sample and a cross-validation sample. Then an exploratory analysis of the conditional covariances is conducted on the training sample data to find the cluster of items that display the greatest evidence of LID. The cross-validation sample is then used to test whether the conditional covariances of the selected cluster of items displays LID, conditioned on total score on the non-clustered items. The DIMTEST statistic follows a standard normal distribution under the null hypothesis of unidimensionality.

The DETECT statistic is an effect-size measure for the size of the LID. As with DIMTEST, the data are first divided into a training sample and a cross-validation sample. The training sample is used to find a set of mutually exclusive and collectively exhaustive clusters of items that best fit a systematic pattern of positive conditional covariances for pairs of items from the same cluster and negative conditional covariances from different clusters. Next, the clusters from the training sample are used with the cross-validation sample data to average the conditional covariances: Within-cluster conditional covariances are summed; from this sum the between-cluster conditional covariances are subtracted, this difference is divided by the total number of item pairs, and this average is multiplied by 100 to yield an index of the average size of the LID for an item pair. DETECT values less than 0.2 indicate very weak LID (near unidimensionality); values of 0.2 to 0.4, weak to moderate LID; values of 0.4 to 1.0, moderate to strong LID; and values greater than 1.0, very strong LID (Roussos & Ozbek, 2006).

Note that the goal of the dimensionality analysis is to evaluate the assumption of unidimensionality in the IRT model used for the calibration. A procedure was introduced in response to the repeated finding in dimensionality analyses from other MSAA assessments that a small (but nontrivial) percentage of the

students, referred to as “R9-stringers,” were exhibiting response behavior incompatible with the assumptions of the psychometric model. R9-stringers are students who respond to nine (or more) consecutive multiple-choice items with the exact same option. Because the calibration data had the R9-stringers removed, the data used in the dimensionality analysis also had the R9-stringers removed. For 2022, the data from R9-stringers were first identified and removed prior to conducting the dimensionality analyses. Table 8-4 summarizes the dimensionality analysis sample sizes both prior to and after removing the data from the R9-stringers.

Table 8-4. Summary of 2021–22 Testing Population

Grade	Total Before Removing Stringers	Total After Removing Stringers	Number of Stringers	Percent Stringers
5	894	760	134	15
8	946	789	157	17
HS	784	638	146	19

DIMTEST and DETECT were separately applied to each grade on the 2021–22 MSA Science tests. Thus, a total of three analyses were conducted. Within each analysis, each dataset was split into a training sample and a cross-validation sample. The sample sizes across the three analyses varied slightly from a low of 638 in high school to 789 in grade 8.

DIMTEST was then applied to every dataset. Even though the sample sizes were not large for the MSA Science, the DIMTEST null hypothesis was rejected at a significance level of 0.05 for every dataset. Next, DETECT was used to estimate the LID effect size for all the tests. Table 8-5 displays the LID effect size estimates from DETECT.

Table 8-5. Average Multidimensional Effect Sizes

Grade	DETECT Effect Size	
	With Stringers	Without Stringers
5	1.53	0.81
8	1.89	0.55
HS	1.56	0.41
Average	1.66	0.59

The results for 2021–22 displayed in Table 8-5 show that Grade 8 and high school showed a moderate level of LID. The DETECT indices for Grade 5 indicate a moderate to strong value of LID. Next, an investigation was conducted to identify the possible source(s) of the violations of local independence that could help explain the DIMTEST and DETECT results. For comparison purposes, Table 8-5 also provides the DETECT indices with data that contain stringers. Very strong LID indices were detected in the analyses with stringers, which indicates that the presence of stringers contributes greatly to the magnitude of the LID in the dimensionality analyses.

The removal of the R9-stringers from the data did not eliminate the key-option clustering, but it did greatly weaken its effect. Although efforts were made to identify stringers, there are still stringers out there that were not detected. For example, other stringers patterns, such as R8 or R7 stringers, exist in the student response data that were not detected by the R9 stringers identification business rule. These stringers may contribute to the high values in effect sizes. Additionally, in the test construction, additional efforts were made to carefully limiting the number of items in a row having the same key.

8.4 Internal Consistency of Domain Scores

Although the spring 2022 MSAA Science did not report domain scores, examining the internal consistency of the domain raw scores provides additional information on how the test functions as a whole. When domain scores are strongly related to each other, it implies a high internal consistency between domains. The Pearson correlations are shown in Tables 8-6. Results generally indicate that the domain scores correlate well with one another and with overall total scores.

Table 8-6. Pearson Correlation of Total Test and Domain Raw Scores on the MSAA Science Per Grade

Subtest	Number of Items	Total Test	1	2	3
Grade 5					
Total Test	39	1.0	--	--	--
1. Earth and Space Sciences	15	0.943	1.0	--	--
2. Life Sciences	12	0.933	0.811	1.0	--
3. Physical Sciences	12	0.929	0.814	0.81	1.0
Grade 8					
Total Test	39	1.0	--	--	--
1. Earth and Space Sciences	12	0.906	1.0	--	--
2. Life Sciences	12	0.933	0.767	1.0	--
3. Physical Sciences	15	0.946	0.790	0.826	1.0
Grade HS					
Total Test	37	1.0	--	--	--
1. Earth and Space Sciences	11	0.896	1.0	--	--
2. Life Sciences	17	0.947	0.765	1.0	--
3. Physical Sciences	9	0.866	0.683	0.741	1.0

Chapter 9. Item Response Theory Scaling and Equating

This chapter describes the procedures used to calibrate and scale the 2022 MSA Science. Throughout these psychometric analyses, several quality-control procedures and checks on the processes were implemented. These procedures included evaluation of item parameters and their standard errors for reasonableness, examination of test characteristic curves (TCCs) and test information functions (TIFs) for reasonableness, evaluation of model fit, and evaluation of the scaling results (e.g., parallel processing by the Data and Reporting Services and the Psychometrics and Research Departments).

9.1 Item Response Theory

All MSA items were calibrated using item response theory (IRT). IRT uses a mathematical model to define a relationship between an unobserved measure of student performance, usually referred to as theta (θ), and the probability ($P(\theta)$) of obtaining a particular score on an item. This mathematical relationship is referred to as the item characteristic curve (ICC). In IRT, all items are assumed to be unique measures of the same construct (i.e., of the same θ). Another way to think of θ is as a mathematical representation of the latent trait of interest. Several common IRT models are used to specify the relationship between θ and $P(\theta)$ (Hambleton & Swaminathan, 1985; Hambleton & van der Linden, 1997). The process of estimating the specific mathematical relationship between θ and $P(\theta)$ is called *item calibration*. After items are calibrated, they are defined by a set of parameters that specify a nonlinear relationship between θ and $P(\theta)$. Once the item parameters are known, an estimate of θ for each student can be calculated based on the student's observed responses to the items. This estimate, $\hat{\theta}$, is considered to be an estimate of the student's true score or a general representation of student performance. It has characteristics that may be preferable to those of raw scores for equating purposes because it specifically models examinee responses at the item level and facilitates equating to an IRT-based item pool (Kolen & Brennan, 2014).

For the 2022 MSA Science tests, the two-parameter logistic (2PL) model was used to estimate the ICC for dichotomous items. The 2PL model for dichotomous items can be defined as:

$$P_i(\theta_j) = P(U_i = 1 | \theta_j) = \frac{\exp[Da_i(\theta_j - b_i)]}{1 + \exp[Da_i(\theta_j - b_i)]},$$

where

U indexes the scored response on an item,

i indexes the items,

j indexes students,

a represents item discrimination,

b represents item difficulty,

θ is the student proficiency, and

D is a normalizing constant equal to 1.701.

For more information about item calibration and estimation, refer to Lord and Novick (1968), Hambleton and Swaminathan (1985), or Baker and Kim (2004).

9.2 Calibration Procedure

Because the 2022 MSAA Science was the first operational year of the assessment program, the item parameters for 2022 operational administration were used to establish the new scale. The procedures used to conduct the calibrations are described in this section.

As described in Section 8-2, in preparation for the operational and field-test calibrations, the R9 stringers were removed from the data. In calibrating the operational items, first, an un-anchored calibration was conducted on all the operational items using PARSCALE (Muraki & Bock, 2003). At this point, each item was carefully examined for model fit. A visual inspection of the item fit plots was conducted. The empirical proportions of correct responses at a given level of ability must follow the shape of the model-based curve. In addition, the item parameter estimates were inspected. The discrimination parameters should not be extreme in either direction (neither greater than 3 nor less than 0.25); the difficulty parameters should also not be extreme (generally between -3 and 3, and definitely between -4 and 4); and the standard error of the difficulty parameters should generally be less than 0.30. Items that violate any of these conditions are automatically marked as “Do Not Use,” though on rare occasions usage is allowed if the item is very close to meeting all the criteria, is needed for meeting substantive content constraints, and does not result in future tests having poorer reliability than the previous year.

Next, the field-test items were calibrated using the Fixed Common Item Parameter (FCIP) approach, where the operational items have their item parameters fixed while the field-test items are calibrated. Then the field-test items were evaluated, based on model-fit and item parameter estimates, in the same way as described above for the operational items. Based on the evaluation of model-fit and item parameter estimates, the field-test items were classified as Do Not Use (DNU) if any model-fit issues were identified or if any item parameter estimates fell outside of the criteria. Items that were not classified as DNU were considered eligible and were then uploaded to the item bank.

After examining the operational items, the psychometric team discovered that item statistics of several operational items fell below the psychometric threshold described above. Since this was the first year for the MSAA Science and given all students take the field-test items, a decision was made in consultation with Cognia content specialists and with the MSAA Science Partners to use field-test items to replace these operational items while maintaining the original content blueprint as much as possible. Table 9-1 lists the number of operational items that were replaced by field-test items.

Table 9-1. Summary of Operational Item Changes

Grade	Number of OP Items Removed	Number of FT items Replaced as OP items	Original Test Length	Updated Test Length
5	6	6	39	39
8	3	3	39	39
HS	10	8	39	37

9.3 Item Response Theory Results

The tables in Appendix J give the IRT item parameters for all the operational items on the 2022 MSAA Science tests by grade based on their pre-equated calibrations. The statistics for the operational items are summarized in Tables 9-2 and 9-3. The mean item parameter estimates shown in the tables are within the generally acceptable and expected ranges. For ease of reference, Table 9-2 displays the

means and standard deviations averaged across all dichotomously scored operational items for each grade.

Table 9-2. IRT Summary Statistics for Dichotomously Scored Items

Grade	Number of Items	a		b	
		Mean	SD	Mean	SD
5	39	0.64	0.30	0.14	0.52
8	39	0.55	0.32	0.38	0.74
HS	37	0.53	0.26	0.48	0.58

Because the items were developed to correspond to different levels, the item statistics have also been summarized by level in Table 9-3.

Table 9-3. IRT Summary Statistics by Grade and Level—Dichotomous Items

Grade	Level	Number of Items	a		b	
			Mean	SD	Mean	SD
5	1	13	0.94	0.28	-0.28	0.19
	2	13	0.53	0.18	0.24	0.47
	3	13	0.44	0.11	0.45	0.52
8	1	13	0.83	0.36	-0.24	0.46
	2	12	0.47	0.20	0.46	0.60
	3	14	0.36	0.15	0.89	0.66
HS	1	13	0.73	0.33	-0.01	0.38
	2	13	0.46	0.18	0.68	0.60
	3	11	0.40	0.07	0.83	0.33

As seen in Tables 9-1 and 9-2, item difficulty tends to have a positive relationship with level: as the level increases, the items tend to be more difficult (as intended). In nearly all cases, the average difficulty increased from Level 1 to Level 2 and from Level 2 to Level 3. The largest differences were clearly the Level 1 to Level 2 differences for all grade levels. To investigate these tendencies more comprehensively, a one-way analysis of variance (ANOVA) was conducted on item difficulty with level as the factor. Item difficulty differed significantly by grade level.

The ANOVAs indicated that level was statistically significant with an R-squared value of 41%. Tukey paired-comparison tests were also conducted across all grades. These results showed statistically significant differences between Level 1 and each of the other levels. The Tukey comparison for Level 2 versus Level 3 was not significant.

The TCCs provide a more complete picture. The TCCs display the expected (average) raw score associated with each θ_j value between -4.0 and 4.0. Mathematically, the TCC is computed by summing the expected score on all the ICCs of all items that contribute to the raw score. Using the notation introduced in the previous section, the expected raw score at a given value of θ_j is

$$E(X|\theta_j) = \sum_{i=1}^n E(U_i|\theta_j),$$

where

X indexes total raw test score,

U_i indexes the scored response on an item,

i indexes the items (and n is the number of items contributing to the raw score),

j indexes students (here, θ_j runs from -2 to 2), and

$E(X|\theta_j)$ is the expected raw score on the test for a student of ability θ_j .

The expected raw score monotonically increases with θ_j , consistent with the notion that students of high ability tend to earn higher raw scores than do students of low ability. Most TCCs are “S-shaped”—flatter at the ends of the distribution and steeper in the middle.

The TIF, $I(\theta)$ (see Lord, 1980, for theoretical definitions and examples of equations), displays the amount of statistical information the test provides at each value of θ_j . Information functions depict test precision across the entire latent trait continuum. There is an inverse relationship between the information of a test and its standard error of measurement (SEM). The SEM at a given θ_j is approximately equal to the inverse of the square root of the statistical information at θ_j (Hambleton, Swaminathan, & Rogers, 1991), as shown below.

$$SEM(\theta_j) = \frac{1}{\sqrt{I(\theta_j)}}$$

Appendix K shows graphs of the TCCs and TIFs for each grade of the MSAA Science.

9.4 Equating

The purpose of equating is to ensure that scores obtained from different forms of a test are equivalent to each other. Equating may be used if multiple test forms are administered in the same year, as well as to equate one year’s forms to those given in the previous year. Equating ensures that students are not advantaged or disadvantaged because the test form they took is easier or harder than those taken by other students. The 2021–22 administration was the first year of the MSAA Science, which was used to establish the initial scale, using one form per grade. No equating procedures were necessary for this administration and future forms will be equated to the scale established in 2021–22.

9.5 Reported Scale Scores

Because the θ scale used in IRT calibrations is not intuitively meaningful to stakeholders, reporting scales were developed for MSAA consistent with established professional practice. The reporting scales are simple linear transformations of the underlying θ scale. The reporting scales range from 1200 through 1290 for all grade/content-area combinations. The second cut was fixed at the July 2022 standard setting to be 1240 for each grade level, as evidenced in Table 9-5a.

By providing more specific information about the position of a student’s results, scale scores supplement performance-level scores. Students’ raw scores (i.e., total number of points) on the 2022 MSAA Science tests were translated to scale scores using a data analysis process called scaling, which simply converts from one scale to another. In the same way that a given temperature can be expressed on either Fahrenheit or Celsius scales, or the same distance can be expressed in either miles or kilometers, student scores on the 2022 MSAA Science tests can be expressed in raw scores or thetas or scale scores (and linear transformation of the theta metric).

It is important to note that converting from raw scores to scale scores does not change students’ performance-level classifications. Scale scores make for more consistent reporting of results. Raw scores are not comparable from year to year because they are affected by differences in group ability and/or difficulty of the items that appear on each test form. Equating is a statistical procedure that is used to

adjust for differences in form difficulty so that scores on alternate forms can be used interchangeably (Kolen & Brennan, 2014). Since the θ scale is used for equating, scale scores are comparable from one year to the next.

The scale scores are obtained by a simple translation of ability estimates ($\hat{\theta}$) using the linear relationship between threshold values on the θ metric and their equivalent values on the scale score metric. Students' ability estimates are based on their raw scores and are found by mapping through the TCC. Scale scores are calculated using the following linear equation:

$$SS = m\hat{\theta} + b,$$

where

m is the slope, and

b is the intercept.

For MSAA Science, the base-form operational scale was set so that the theta corresponding to the proficient cut from the July 2022 standard setting was transformed to a scale score of 1240. The theta value of 4 was set corresponding to the highest obtainable scale score (HOSS) and transformed to a scale score of 1290. The lowest obtainable scale score (LOSS) was set at 1200. A separate linear transformation is used for each grade and content-area combination. Because only two points within the θ scale score space were fixed, the scale score cutpoints between Level 1 and Level 2 and between Level 3 and Level 4 were free to vary across the grade and content-area combinations. (As seen in Table 9-4).

Table 9-4 shows the slope and intercept values used to calculate the scale scores for each content area and grade. Note that the values in Table 9-4 will not change unless the standards are reset.

Table 9-4. Scale Score Slope and Intercept by Grade

Grade	Slope	Intercept
5	12.44843	1240.20627
8	12.81723	1238.73110
HS	13.56160	1235.75359

Appendix L contains raw score to scale score lookup tables for the 2022 MSAA Science tests. These are the actual tables used to determine student scale scores, error bands, and provisional performance levels. Graphs of the scale score cumulative frequency distributions for the 2022 MSAA Science tests and for the most recent past test are presented in Appendix M.

9.6 MSAA Science Provisional Performance Levels, Cut Scores, and Standard Setting

Cut scores for MSAA in science were set in a standard-setting process that took place in July 2022. Details of the standard-setting procedures can be found in the standard-setting report (Cognia, 2022). Because of a technical issue that occurred during the standard setting, these cuts are considered provisional and performance standards (i.e., cut scores) will be reestablished before scale scores and performance levels are reported next year.

A complete description of the standard-setting processes appears in the 2022 *MSAA Science Standard-Setting Report*.

Provisional cut scores, for the 2022 MSAA Science, appear in Table 9-5a and Table 9-5b.

Table 9-5a. Cut Scores on the Theta Metric and Reporting Scale

Grade	Theta			Scale Score				
	Cut1	Cut2	Cut3	Minimum	Cut1	Cut2	Cut3	Maximum
5	-0.38509	-0.01657	1.01755	1200	1235	1240	1253	1290
8	-0.45912	0.09900	0.70519	1200	1233	1240	1248	1290
HS	-0.04877	0.31312	0.84906	1200	1235	1240	1247	1290

Table 9-5b. Cut Scores Reporting Scale Range

Grade	Level 1	Level 2	Level 3	Level 4
5	1200–1234	1235–1239	1240–1252	1253–1290
8	1200–1232	1233–1239	1240–1247	1248–1290
HS	1200–1234	1235–1239	1240–1246	1247–1290

Table 9-6 shows the percentage of students by performance-level categories along with the average and standard deviation of the scale scores for each grade/content-area combination. Also, the percentages of Levels 3 and 4 (levels corresponding to Proficient and above, which are the levels of critical interest for federal accountability purposes) within each grade and content area are provided in the table.

Table 9-6. Percentage of Students by Performance-Level Categories and Scale Score Summary

Grade	Number of Students	Levels					Levels 3 & 4	Average Scale Score	SD of Scale Score
		Level 1	Level 2	Level 3	Level 4				
5	940	39.6%	17.4%	30.4%	12.6%	43.0%	1238.55	15.62	
8	991	44.3%	19.9%	18.0%	17.9%	35.8%	1236.92	15.34	
HS	830	52.2%	20.0%	14.2%	13.6%	27.8%	1233.76	14.95	

Chapter 10. Reliability

Although the psychometric characteristics of an individual item's performance are an important focus for evaluation, a complete evaluation of an assessment must also address the way items function together. Tests that function well provide a dependable assessment of the student's level of ability. Unfortunately, no test can do this perfectly. A variety of factors can contribute to a given student's score being either higher or lower than his or her true ability. For example, a student may misread an item or mistakenly fill in the wrong bubble when he or she knew the right answer. Collectively, extraneous factors that affect a student's score are referred to as "measurement error." Any assessment includes some amount of measurement error; that is, no measurement is perfect. This is true of all academic assessments—some students will receive scores that underestimate their true ability and other students will receive scores that overestimate their true ability. When tests have a high amount of measurement error, student scores are very unstable. Students with high ability may get low scores or vice versa. Consequently, one cannot reliably estimate a student's true level of ability with such a test. Assessments that have less measurement error (i.e., errors made are small on average and student scores on such a test will consistently represent their ability) are described as "reliable."

There are several ways to estimate test reliability, the most common method is Cronbach's alpha. Cronbach's alpha could be applied to the MSAA Science; however, since the IRT-based reliability was used for MSAA ELA and mathematics, we implemented the same procedure for the MSAA Science for consistency purposes. Thus, an IRT-based estimate of reliability that results in a single value for each grade-level assessment was used.

10.1 IRT Marginal Reliability

IRT marginal reliability estimation is based on applying the standard classical test theory (CTT) formula, relating variances of true score, observed score, and measurement error in the IRT setting. In CTT, the relationship between these variances is given by:

$$\sigma_X^2 = \sigma_T^2 + \sigma_E^2$$

where σ_X^2 is the observed-score variance, σ_T^2 is the true-score variance, and σ_E^2 is the error variance.

Starting from this basic equation, it can be shown that the formula for CTT reliability can be expressed by:

$$CTT \text{ Reliability} = 1 - \frac{\sigma_E^2}{\sigma_X^2}$$

IRT marginal reliability is based on extending the CTT model to an IRT framework (Samejima, 1994) and provides an IRT-based estimate of the overall test reliability. Error variance is estimated as the mean squared conditional standard error of measurement (CSEM) of the theta estimates across students within a grade. Observed score variance is estimated as the variance of the theta estimates across students within a grade. Equivalently, the mean squared CSEM of the scale scores and the variance of the scale scores can be used in place of the CSEM of the theta estimates and the variance of the theta estimates, respectively. IRT marginal reliability is then given by the following formula:

$$IRT \text{ Marginal Reliability} = 1 - \frac{\overline{CSEM(\theta)^2}}{Var(\hat{\theta})} = 1 - \frac{\overline{CSEM(SS)^2}}{Var(SS)}$$

where

$\overline{CSEM(\theta)^2}$ is the mean squared CSEM,

$\overline{CSEM(SS)^2}$ is the mean squared scale CSEM,

$Var(\hat{\theta})$ is the variance of theta estimates, and

$Var(SS)$ is the scale score variance.

Using this formula, IRT marginal reliability estimates were calculated for each grade.

The reliability of a test can also be evaluated by simply examining the CSEMs themselves. CSEMs facilitate the interpretation of individual scale scores. With any given scale score estimate for a student, the reasonable limits of the true scale score for the student can be calculated by using the CSEM for the scale score.

Table 10-1 presents descriptive scale score statistics, IRT-based reliability, and mean scale score CSEMs by grade. (Statistics are based on operational items, which counted toward students' reported scores only.) As shown in the table, most of the values reached levels associated with adequate reliability (0.80 or higher). The mean Scaled CSEM shows that the precision of the scale score is within the normal range.

Table 10-1. IRT Marginal Reliability by Grade

Grade	Min	Max	Mean	SD	IRT Marginal Reliability	Mean Scaled CSEM
5	1208	1290	1242.65	12.53	0.87	4.29
8	1203	1290	1240.35	13.67	0.86	4.93
HS	1204	1290	1238.12	11.88	0.80	5.17

10.2 Subgroup Reliability

The reliability coefficients discussed in the previous section were based on all students who took a MSAA Science test. As an alternate assessment program, it is likely that there are reliability differences across subgroups. For this reason, reliability coefficients for different subgroups were calculated, including gender, ethnicity, limited English proficiency (LEP) status, socioeconomic status, migrant status, and various disability categories. Appendix N presents reliabilities for various subgroups of interest. Subgroup reliabilities were calculated using the IRT-based formula (defined above) based only on the members of the subgroup in question in the computations; values were calculated only for subgroups with 100 or more students and where more than 25% of the students scored above the LOSS (lowest obtainable scale score, which was 1200).

For several reasons, the results relating to subgroup reliability should be interpreted with caution. First, reliabilities are dependent not only on the measurement properties of a test but on the statistical distribution of the studied subgroup. For example, it can readily be seen in Appendix N that subgroup sample sizes varied considerably, which results in a natural variation in reliability coefficients. Alternatively, reliability, which is a type of correlation coefficient, may be artificially depressed for subgroups with little variability (Draper & Smith, 1998). Second, there is no industry standard to interpret the strength of a reliability coefficient, especially when the population of interest is a single subgroup.

Again, the reliability statistics provided in the tables in Appendix N should be cautiously interpreted because of the restriction of range mentioned earlier (Section 8.1).

10.3 Reliability of Performance-Level Categorization: Accuracy and Consistency

While related to reliability, the accuracy and consistency of student classification into performance categories are even more important statistics in a standards-based reporting framework (Livingston & Lewis, 1995). After the provisional performance levels were specified and students' performances were classified into those levels, empirical analyses were conducted to determine the statistical accuracy and consistency of the classifications. For the MSAA, students are classified into one of four performance levels: Level 1, Level 2, Level 3, or Level 4. This section of the report explains the methodologies used to assess the reliability of classification decisions, and results are provided.

Accuracy refers to the extent to which decisions based on test scores match decisions that would have been made if the scores did not contain any measurement error. Consistency measures the extent to which classification decisions based on test scores match the decisions based on scores from a second, parallel form of the same test. Consistency can be evaluated directly from actual responses to test items if two complete and parallel forms of the test are given to the same group of students. In operational test programs, however, such a design is usually impractical.

However, techniques have been developed to estimate both the accuracy and the consistency of classification decisions based on a single administration of a test. The Rudner (2001, 2005) technique was used for the MSAA Science assessments because it can be easily applied to data that are scored in the IRT theta metric or any linear transformation of this metric, such as the scale scores. The applicability of the Rudner technique to IRT-based metrics distinguishes this method from methods based on observed scores, such as the Lewis and Livingston (1995) method.

For details of the Rudner method, refer to Rudner (2001, 2005); given here is a brief review of the basic idea behind the method. Using an examinee's estimated scale score and standard error, assuming a normal probability distribution, the method first calculates for all examinees at a fixed value of true scale score, the expected proportion whose observed scale score is in an interval $[a,b]$. Then, by summing over all examinees whose true scale scores are in an interval $[c,d]$, the method yields the expected proportion of all examinees whose true scale score is in $[c,d]$ and whose observed scale score is in $[a,b]$. By setting $[a,b]$ and $[c,d]$ to correspond to the true score intervals defined by the cut scores yields the elements of a classification table that shows the expected proportion of all examinees with observed and true scale scores in each cell. These proportions can then be used to calculate both classification accuracy and classification consistency estimates.

For the classification accuracy tables, cell $[i, j]$ represents the estimated proportion of students whose true scale score fell into classification i (where $i = 1$ to 4, for the four achievement levels) and whose observed scale score fell into classification j (where $j = 1$ to 4). The sum of the diagonal entries (i.e., the proportion of students whose true and observed classifications matched) signified overall accuracy.

For the classification consistency tables, cell $[i, j]$ of this table represents the estimated proportion of students whose observed scale score on the first of the two hypothetical parallel tests would fall into classification i (where $i = 1$ to 4) and whose observed scale score on the second hypothetical parallel test would fall into classification j (where $j = 1$ to 4). The sum of the diagonal entries (i.e., the proportion of students categorized by the two forms into exactly the same classification) signified overall consistency.

Another way to measure consistency is to use Cohen’s (1960) coefficient κ (kappa), which assesses the proportion of consistent classifications after removing the proportion of consistent classifications that would be expected by chance. It is calculated using the following formula:

$$\kappa = \frac{(\text{Observed agreement}) - (\text{Chance agreement})}{1 - (\text{Chance agreement})} = \frac{\sum_i C_{ii} - \sum_i C_i C_i}{1 - \sum_i C_i C_i},$$

where

C_i is the proportion of students whose observed performance level would be Level i (where $i = 1-4$) on the first hypothetical parallel form of the test;

C_{i} is the proportion of students whose observed performance level would be Level i (where $i = 1-4$) on the second hypothetical parallel form of the test; and

C_{ii} is the proportion of students whose observed performance level would be Level i (where $i = 1-4$) on both hypothetical parallel forms of the test.

Because κ is corrected for chance, its values are lower than other consistency estimates.

Figure 10-1 shows the overall decision accuracy for science by grade level. More details on decision accuracy and consistency (DAC) are provided in Appendix O. Table O-1 in Appendix O includes overall accuracy and consistency indices, along with kappa. Accuracy and consistency values conditional on performance level are also provided in Table O-1. For these calculations, the denominator is the proportion of students associated with a given performance level. Following is an example from Table O-1, looking at Level 1 for grade 5.

- The conditional *accuracy* value was 0.85. This indicates that among the students whose *true scale scores* placed them in Level 1, 85% would be expected to be in this same level again when categorized according to their observed scale scores.
- The *consistency* value was 0.76. This indicates that among the students whose *observed scale scores* placed them in Level 1, 76% would be expected to be in this same level again if a second parallel test form were used.

For some testing situations, the greatest concern may be decisions regarding level thresholds. For example, in testing done for Every Student Succeeds Act (ESSA) accountability purposes, the primary concern is distinguishing between students who are proficient and those who are not yet proficient. For the 2022 MSAA Science, Table O-2 in Appendix O provides accuracy and consistency estimates at each cutpoint, as well as false positive and false negative decision rates. A false positive rate is the proportion of students whose observed scores were above the cut and whose true scores were below the cut. A false negative rate is the proportion of students whose observed scores were below the cut and whose true scores were above the cut.

Figure 10-1. Overall Decision Accuracy for Science by Grade

Chapter 11. Validity Arguments to Support Intended Score Interpretations and Uses

Chapter 11 presents the primary intended score interpretation and three primary intended score uses for the MSAA Science. This chapter also presents the assumptions that underlie these four score interpretations and uses (SIUs - see Appendix P for a list of acronyms) and the evidence that relates to the assumptions. Also, we introduce the MSAA Science rating scales to evaluate the degree to which the evidence supports each SIU claim. As first noted in Chapter 1 and elsewhere within the report, the MSAA Science assessment is part of the comprehensive alternate assessment program, which also includes the MSAA ELA and mathematics. Some ratings of evidence are unique to the MSAA Science, while others are relevant to all three content areas. It is important to note that the 2022 MSAA Science tests were administered at the end of a school year in which COVID-19 may still have had a strong impact on instruction and learning. Additionally, as noted in earlier chapters, spring 2022 was the first operational administration of the MSAA Science tests.

The *Standards for Educational and Psychological Testing* (2014) define validity as “the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests” (p. 11). Elaborating on that definition, the *Standards* asserts that “it is the interpretations of test scores for proposed uses that are evaluated, not the test itself” (p. 11) and that “validation logically begins with an explicit statement of the proposed interpretation of test scores, along with a rationale for the relevance of the interpretation to the proposed use” (p. 11). This definition applies specifically to intended interpretations and uses of test scores, rather than to the broader program of curriculum and instruction in which a testing program is embedded or to the surrounding education and school improvement policies and aspirations for student learning.

Further, the *Standards* state that “a sound validity argument integrates various strands of evidence into a coherent account of the degree to which existing evidence and theory support the intended interpretations of test scores for specific uses” (p. 21).

The goal of any evidence rating scale presented in this report is to **evaluate the degree to which the evidence supports each score interpretation and use (SIU) claim**. SIU claims for the MSAA Science are defined for the MSAA Science as assumptions, elements, and sub-elements. For the first administration of the MSAA Science, we are using a three-dimensional rating scale in this 2022 technical report: **relevance** of the evidence, **completeness** of the evidence, and **overall support** of the SIU claim provided by the evidence. We also identify possible challenges to the assumptions, elements, and arguments.

The MSAA Science Validity Argument Logic Model

The logic for the MSAA Science’s validity arguments for each assumption, element, and sub-element is displayed in Figure 11-1. In the left-hand panel, MSAA Science assumptions appear at the left and connect directly to a corresponding validity argument, shown on the right. The evidence that supports the MSAA Science assumptions, elements, and sub-elements (and required inferences) connect directly to the assumption-validity argument pairings. The panel on the right provides an illustration. Note that there

are multiple assumptions to support the higher-level assumption (i.e., assumption 1.1, "reliable and valid information") and multiple elements that support assumptions (i.e., element 1.1.1, "aligned").

This logic is deceptively simple, as it appears to suggest that simply providing evidence to support an assumption provides the basis for a validity argument. However, and as per Toulmin's (1958) formulation, any validity argument may also require warrants, qualifiers, backings, and rebuttals.²

Figure 11-1. MSAA Validity Argument Model

Adapted from Ferrara & Qunbar (2022) and Chapelle (2021) Figures 2.1-2.3, Kane (2013) Figure 1, and Toulmin (1958).

The Evidence Evaluation Rating Scale

The multidimensional rating scale contains three separate rating scales, as we describe below. To facilitate efficient discussion, we use the term “SIU claims” to refer to MSAA Science assumptions, elements, and sub-elements in evidence evaluations and validity arguments. The term “claim” is used widely and is readily recognizable in the educational measurement community. These three rating scales focus on evidence relevance, completeness, and overall support. These categories appear to be similar to other evidence rating systems. For example, Schum (1994) proposed and illustrated three evidence categories for probabilistic reasoning: relevance, credibility, and inferential force. In particular, we think that the Cognia category, Overall Support, is similar to Schum’s category, Inferential Force.

In the MSAA Science validity argument model, the overall validity argument is that the existing design, procedural, and psychometric evidence supports the four intended score interpretations and uses. Each of the interpretations and uses represents a set of assumptions and elements that require supporting evidence to connect the evidence to the assumption. This line of reasoning and argumentation creates supported MSAA validity arguments. Sections 11.1 and 11.2 describe the

1. four intended SIUs;
2. assumptions and their elements, which connect the MSAA Science design, procedural, psychometric, and other program information to the SIUs; and
3. evidence that supports each assumption and element (and which is provided in detail in Chapters 2–10).

²**Warrants** explain how the evidence leads to the claim. We include these explanations in the rating scale, which we define later, and in our validity arguments. **Qualifiers** indicate the relative strength of explanations, which we evaluate in the rating scale. **Backings** are support for the explanation and often are preceded by “because.” **Rebuttals** are arguments that oppose, undermine, or limit warrants or claims. We address rebuttals for some SIU claims immediately following a validity argument.

The relationships among the score interpretations and uses, assumptions, and elements appear in Table 11-1, with descriptions and summaries of the supporting evidence.

Table 11-1. Relationships Among Score Interpretations and Uses, Necessary Assumptions, and Elements That Support the Assumptions

Necessary Assumptions	Elements That Support Assumptions
Primary Intended Score Interpretation	
The MSAA Science scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining.	
1.1	<p>The content of the test represents the content of the standards (i.e., the Extended Performance Expectations).</p> <p>1.1.1. The Extended Performance Expectations are aligned to the standards (aka, Performance Expectations) from A Framework for K-12 Science Education and, as such, aligned to each partner’s academic content standards for each grade level.</p> <p>1.1.2. The 2022 MSAA Science items are aligned to the Extended Performance Expectations.</p> <p>1.1.3. The MSAA Science Partners have confirmed that the Science Extended Performance Expectations, which are assessed on the MSAA Science, are aligned with each partner’s academic content standards for each grade level.</p> <p>1.1.4. The 2022 operational MSAA Science items are aligned to the MSAA performance level descriptors.</p>
1.2	<p>MSAA Science test items are construct relevant. The elements corresponding to this assumption are concerned with the skills and cognitive processes required to understand and respond to an item in particular, whether they correspond to the skills and processes required in the performance level descriptors (PLDs).</p> <p>1.2.1. Items require application of the KSAs of the targeted construct.</p> <p>1.2.2. Items are accessible to all students.</p> <p>1.2.3. Appropriate accommodations are provided to meet student needs.</p> <p>1.2.4. Scaffolding is not a source of construct-irrelevant variance.</p> <p>1.2.5. Item rendering does not interfere with student access to test content.</p> <p>1.2.6. Platform does not interfere with student interaction with test content.</p> <p>1.2.7. Parents understand and interpret correctly MSAA Science scores and other information to understand their child's progress across grades.</p> <p>4.2.2. Parents use MSAA Science scores and other information appropriately to understand their child's progress across grades and make decisions about their child's education and learning needs.</p>

Relevance of the Evidence for a Claim

We define relevance to a claim as “the quality or state of being closely connected or appropriate” (Lexico.com, 2019). We evaluate the relevance of each collection of evidence that we offer for each claim. Relevance is most closely associated In Toulmin’s model of argumentation with grounds (i.e., what makes the evidence reliable). We acknowledge that we would not propose evidence to support a claim unless it is strongly relevant to that claim. However, it is important to evaluate relevance for each collection of evidence to enable debate if debate is warranted. In addition, individual pieces of evidence in a collection of evidence may be more or less relevant.

The relevance rating scale is as follows.

- The evidence is **highly relevant** to the claim and would withstand challenges.
- The evidence is **moderately relevant** to the claim and would withstand some challenges.
 - Illustration: We propose co-relationships between elements or sub-elements in a claim which may be judged as only moderately relevant because they are not a direct measure of the claim. For example, test content is directly relevant to the MSAA Extended Performance Expectations. But we do not have direct evidence of the relevance of these content standards with long term outcomes such as post-graduation job performance.
- The relevance of the evidence is open to reasonable rebuttal or debate.
 - Some evidence could be challenged by reasonable, well-intentioned measurement and content specialists, and may not withstand some challenges.

We note that the quality or persuasiveness of the evidence is implied in these definitions of relevance.

Completeness of the Evidence that Supports a Claim

We define completeness as “the state or condition of having all the necessary or appropriate parts” (Oxford languages; https://www.google.com/search?q=completeness+definition&rlz=1C1CHBD_enUS945US945&oq=completeness+de&aqs=chrome..69l57j0i512l5j0i22i30l4.4655j1j15&sourceid=chrome&ie=UTF-8).

Complete Evidence: All pieces of relevant evidence in an evidence collection for a claim are provided to support a validity argument.

Moderate to Substantial Evidence: Several or nearly all pieces of relevant evidence are provided in a collection of evidence for a claim, but not all required pieces are available.

Limited Evidence: When only one or two pieces of evidence are provided, where the evidence may be only marginally relevant or where more than one or two pieces of evidence may be required.

No Evidence: No relevant evidence exists.

Overall Support for a Claim

Finally, we provide an overall evaluation of the degree to which the collection of evidence supports a claim. This is intended to be a holistic evaluation of the available evidence, rather than a composite of the evaluations in the other two rating scales.

Evidence **strongly supports** the claim.

Note. “Fully supports” has been proposed in place of “strongly supports”; we operate on a widely held idea that we always can generate more evidence.

Evidence **moderately supports** the claim.

Illustration: Evidence may support complete unidimensionality of a test or may include a minor second factor; a factor small enough to argue that the test is essentially unidimensional (e.g., Stout, 1987, 1990).

Evidence provides **limited support** of the claim.

Evidence **does not support** the claim or does not exist.

Possible Challenges to the Degree to Which Evidence Supports a Claim

All evaluations of collections of evidence are challengeable. Toulmin, 1958, refers to this as “rebuttals.” So, using terms from Toulmin’s model of arguments, we evaluate possible rebuttals and qualifiers.

Challenges to the evidence can come in at least two forms:

Rebuttals, in which someone might challenge the relevance or completeness of the evidence, and

Qualifiers, where someone may identify situations in which the claim may not be true.

We do not offer a rating scale to evaluate the susceptibility of evidence to challenges.

The primary score interpretation and use statements (SIUs) for which supporting evidence is needed are as follows.

Primary Intended MSAA Score Interpretation

MSAA scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining.

Primary Intended MSAA Score Uses

- Schools and districts use the MSAA and its results to (a) monitor trends in student performance and (b) design professional development for teachers.
- Teachers use the MSAA and its results to better integrate assessment with their instructional planning.
- Parents use the MSAA and its results to get information about (a) what their child knows and what their child can do and (b) their child’s progress from year to year.

11.1 Primary Intended Score Interpretation

The MSAA Science scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining.

Assumption 1.1. The content of the test represents the content of the standards (i.e., the Extended Performance Expectations).

The evidence to support this test alignment assumption and its elements was generated in an alignment study that was conducted in 2022. Details regarding the alignment report and evidence of findings is available by contacting the MSAA Science Partners at MSAA@azed.gov.

Element 1.1.1. The Extended Performance Expectations are aligned to the standards (aka, Performance Expectations) from *A Framework for K-12 Science Education* and, as such, aligned to each MSAA Science Partner’s academic content standards for each grade level.

Evidence:

The technical manual summarizes evidence from the early development activities that took place. Cognia’s development team completed the Performance Expectation prioritization work and then developed the Extended Performance Expectations. Following this, a stakeholder review was conducted that focused on domain coverage, content centrality, performance centrality, and depth of knowledge. Overall, the stakeholders confirmed the domain coverage, content centrality and performance centrality. Feedback provided by stakeholders was incorporated into the Extended Performance Expectations. Study results are listed in Chapter 2.

Relevance: Evidence is highly relevant.

Completeness: Evidence is complete

Overall Support: Existing evidence provides strong support to the element.

Possible Challenges: None

Element 1.1.2. The 2022 MSAA Science items are aligned to the Extended Performance Expectations. **Evidence:** Item specifications and development and review processes every year are designed and implemented to ensure that items are closely aligned to the Extended Performance Expectations. A new alignment study was conducted in September 2022. Study results are listed in Chapter 3. In summary, the grade level items were well aligned for both content centrality and performance centrality. At least 90% of items were judged as having *some* or *all* of the same performance expectations of the EPEs. Domain concurrence for each grade level was well aligned, at least 90% of the items on the test form align to an EPE defined in the blueprint, no item on the test form reflects expectations not defined in the grade level, and each of the domains in the blueprint is represented by items on the form.

Relevance: Evidence is highly relevant.

Completeness: Evidence is complete

Overall Support: Existing evidence provides strong support to the element.

Possible Challenges: None

Element 1.1.3. The MSAA Science Partners have confirmed that the Science Extended Performance Expectations, which are assessed on the MSAA Science, are aligned with each partner’s academic content standards for each grade level.

Evidence: Membership in MSAA requires each member to adopt the academic content standards that are assessed on the MSAA.

Relevance: Evidence is highly relevant.

Completeness: Evidence is complete.

Overall Support: Existing evidence strongly supports the element.

Possible Challenges: A follow-up study of alignment between the EPEs and each partner’s academic content standards may be warranted if the partner’s standards are modified.

Element 1.1.4. The 2022 operational MSAA Science items are aligned to the MSAA performance level descriptors.

Evidence: The science items are developed following item specifications for each EPE. The item specifications accomplish two purposes: They (1) provide both general and specific guidelines for developing all test items at the grade levels assessed, and (2) describe the test items and provide samples as reference. Sections in the specification documents are dedicated to information about target EPEs, item contexts, variable features, cognitive task levels, use of graphics, item style and format, and general content limits by academic grade-level content target. As such, because items are developed from the item specifications, they are aligned to the performance level descriptors.

Relevance: Evidence is moderately relevant.

Completeness: Evidence is limited.

Overall Support: Existing evidence provides limited support to the element.

Possible Challenges: There are 12 EPEs, with three levels of items, on the blueprint. Each set of PLDs was written specifically for each EPE (12 sets of PLDs in total). With the limitation of the current item bank, MSAA Science does not have items aligned to each EPE and PLD combination (144 combinations). However, this limitation will be alleviated and addressed in future test development cycles.

Assumption 1.2. MSAA Science test items are construct relevant. The elements corresponding to this assumption are concerned with the skills and cognitive processes required to understand and respond to an item in particular and whether they correspond to the skills and processes required in the PLDs.

Element 1.2.1. Items require application of the KSAs of the targeted construct.

Element 1.2.2. Items are accessible for all students.

Element 1.2.3. Appropriate accommodations are provided to meet student needs.

Element 1.2.4. Scaffolding is not a source of construct-irrelevant variance.

Element 1.2.5. Item rendering does not interfere with students' access to test content.

Element 1.2.6. Platform does not interfere with students' ability to interact with test content.

Element 1.2.7. Items are free of bias and sensitivity issues.

The evidence for Elements 1.2.1 through 1.2.7 is interrelated. Some evidence is relevant to a single element. Other evidence is relevant to multiple elements. For that reason, the elements are listed as a group, rather than individually. After listing the evidence for these elements, the relevance of the evidence for each individual element is summarized.

Evidence for 1.2.1: The 2022 operational MSAA Science items are aligned to the Extended Performance Expectations, which supports this element. The evidence for Element 1.2.1 is directly linked to Element 1.1.2. As noted above in Element 1.1.2 (Assumption 1.1: The content of the test represents the content of the standards [i.e., the Extended Performance Expectations]), the evidence for 1.1.2 is Complete Evidence. Additionally, in the science standard setting, a process was included in which subject matter experts evaluated the knowledge, skills, and abilities (KSA) demands of the items relative to the KSAs in the PLDs, which provides additional evidence.

Evidence for 1.2.1, 1.2.2, 1.2.3, 1.2.4, 1.2.5, 1.2.6, and 1.2.7: During the item development process, the items followed a rigorous development cycle, including reviews by MSAA Science

Partners and by Item Content and Bias and Sensitivity panelists. See Chapter 3 for a detailed description of the item review process.

Evidence for 1.2.7: In differential item functioning (DIF) analyses, we examine subgroup differences in performance when sample sizes permit. Actions are taken to ensure that differences in performance are due to construct-relevant, rather than irrelevant, factors. A detailed description of the DIF analysis procedures is given in Chapter 8 along with a summary of the results. Detailed results are presented in Appendix I. Data review also examines the bias and sensitivity of the tested items. Bias and sensitivity checks are also implemented during the item development process.

Summary of evidence for 1.2.1:

Relevance: The evidence is highly relevant.

Completeness: The evidence is complete

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: A cognitive lab may also help inform the targeted construct. However, since MSAA Science test development uses the experiences from the MSAA ELA and mathematics interaction study, a separate Cognitive Lab is not as critical.

Summary of evidence for 1.2.2:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial,

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: Results of a teacher survey on their experience regarding accessibility during test administration would provide additional evidence.

Summary of evidence for 1.2.3:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial.

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: Results of a teacher survey of their experience regarding accommodations during test administration would provide additional evidence.

Summary of evidence for 1.2.4:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial.

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: A study evaluating whether construct-irrelevant variance is present in items that take new approaches to assessing the EPEs may be warranted.

Summary of evidence for 1.2.5:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial.

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: Results of a teacher survey of their experience regarding any issues having to do with item rendering during test administration would provide additional evidence.

Summary of evidence for 1.2.6:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial.

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: Results of a teacher survey of their experience regarding any issues having to do with the platform during test administration would provide additional evidence.

Summary of evidence for 1.2.7:

Relevance: The evidence is highly relevant.

Completeness: The evidence is Moderate to Substantial.

Overall Support: The existing evidence strongly supports the claim.

Possible Challenges: None

Assumption 1.3. Test administrations in MSAA states in 2022 followed prescribed, standardized procedural requirements.

Element 1.3.1. Test Administrators and School and District Coordinators understood and performed their roles appropriately.

Evidence: Test Administrators participated in mandatory test administration training. Chapter 5, Training and Administration, provides detailed evidence in regard to ensuring the Test Administrators and Test Coordinators properly understood and performed their roles.

Six online training modules address the specific responsibilities of the Test Administrators and provide information from the three documents they were required to use: Test Administrator Manual (TAM), the Directions for Test Administration (DTA), and the MSAA Online Assessment System User Guide for Test Administrators. Additionally, there is a training module specific to science that outlines the background and design of that content area. After completing the training modules, Test Administrators were required to successfully complete a final quiz with a score of 80% or better.

Required training for Test Coordinators. Six online training modules address the responsibilities of the Test Coordinators. Test Coordinators were also provided with the following supporting documents: TAM, DTAs, the MSAA Online Assessment System User Guide for Test Administrators, and the MSAA Online Assessment System User Guide for Test Coordinators. In addition, each Test Administrator:

- received four best practice videos;
- received a technical support chart that provides examples of when and who to contact to obtain answers concerning MSAA assessment or administration; and
- completed a survey. (Results are evidence that address this element.)

All the above evidence is described in detail in Chapter 5.

Observers were sent into the field to observe test administration and complete an observation checklist. The checklists and any accompanying notes provide evidence as to whether the training was effectively followed by the Test Administrators and Test Coordinators.

The summarized results from 2021–22 MSAA Science administration observations are included below:

- Of 10 Arizona observations, 10 administered the MSAA following the instructions in the Directions for Test Administration (DTA).
- All use of DTA was indicated as high fidelity.
- All 10 observations also indicated secure storage of secure test materials.

Relevance: The evidence is highly relevant.

Completeness: The evidence is limited.

Overall Support: The evidence provides limited support for the claim.

Possible Challenges: Additional observations are required for a representative sample.

Element 1.3.2. Test security concerns were limited.

Chapter 5, Section 5.6.11, *Test Security and Test Irregularities*, provides detailed evidence indicating that test security policies and practices resulted in limited test security concerns.

Evidence: Evidence for 1.3.2 includes the following:

- Irregularity reports, which Test Administrators and District Test Coordinators file if disruptions to orderly test administrations occur or if they observe suspicious activity related to test content security or student test data integrity, indicate no significant problems. Specifically, for 2021–22 administration, no instance of irregularity was reported.

Relevance: The evidence is highly relevant

Completeness: The evidence is limited

Overall Support: The evidence provides limited support to the claim

Possible Challenges: None

Assumption 1.4. Test scores on the 2022 MSAA Science provide reliable information about student performance and accurate classifications into provisional performance levels.

Element 1.4.1. MSAA scores and categorizations into provisional performance levels are adequately reliable for their intended purpose.

Evidence: Evidence for 1.4.1 includes the following:

- Internal consistency: Chapter 10 provides a description of reliability theory and interpretation, a review of the relevant equations, and a summary of the results. In particular, the reliability estimates can be interpreted as the correlation that would be obtained between scaled scores on two parallel forms. All MSAA tests show adequate reliability IRT marginal reliability value of 0.8 or higher.
- Scaled score standard errors: Chapter 9 provides a description of calculation and interpretation of the scaled scores, as well as a description of the calculation of the standard error for a scaled score. The average standard error for a reported scaled score

is reported in Chapter 10. The scaled score standard error can be compared to the scaled score range and the scaled score standard deviation to provide some context for interpretation.

- Performance level classification consistency and accuracy estimates: Accuracy is an estimate of the probability that the observed classification is the true classification. Consistency is an estimate of the probability that students would receive the same classification if they tested twice on parallel forms. Chapter 10 describes the theory and equations underlying the estimation of classification accuracy and consistency, while also reporting summary statistics. Detailed results are provided in Appendix O.

Relevance: Evidence is highly relevant.

Completeness: Evidence is complete.

Overall Support: Existing evidence strongly supports the element.

Possible Challenges:

1. The cut scores and performance levels for 2022 school year is provisional, as they will be re-evaluated in 2023 after the next administration. For the current year, the scale score and performance level are reliable given the approved provisional cut scores.
2. Readers could discuss any possible impacts on the reliability evidence that could stem from the local item dependence detected in the dimensionality analysis (see section 8.3). Such a challenge would be balanced against the strong evidence of the unidimensional item response functions fitting the data well, along with the research of Roussos, Li, & Lonczak (2013), who have shown that when total test score is used for ability estimation, there is only negligible under-estimation of the standard errors of the test scores, even when the LID is large. This stems from the fact that when positive LID occurs for some item pairs it is essentially equally balanced by negative LID, the presence of which has been ignored in papers discussing the effects of positive LID (Habing & Roussos, 2003).

Element 1.4.2. Item characteristics support intended interpretations about all students who take the MSAA.

Evidence: The psychometric characteristics most pertinent to evaluating the adequacy of individual items are the estimated item parameters. The item parameter estimates are summarized in tables in Chapter 9. For dichotomously scored items, the item parameters include the discrimination parameter and the difficulty level parameter. All items undergo statistical analyses at the time of field testing, including classical, DIF, and IRT analyses. The results of these analyses are reviewed in Data Review meetings with the MSAA Science Partners. Only those field-tested items that pass statistical and Data Review criteria are passed forward for operational use.

After field-testing and prior to operational administration, items from the previous operational administration will be reviewed for their item information function (IIF) contributions at the performance level cuts to evaluate and rate the quality of each item. After each operational administration, dimensionality analyses are also conducted to determine how the items correlate with each other in terms of the underlying constructs of the test.

Relevance: Evidence is highly relevant.

Completeness: Evidence is complete.

Overall Support: Existing evidence strongly supports the element.

Possible Challenges: Could have discussion of any possible impacts on the ICC and IIF evidence that could stem from the local item dependence detected in the dimensionality analysis. In this regard, such a challenge would be balanced against the strong evidence of the unidimensional item response functions fitting the data well, the paucity of items flagged for DIF, and the research of Roussos, Li, & Lonczak (2013), who have shown that when total test score is used for ability estimation, there is only negligible underestimation of the standard error of the test scores, even when the LID is large. This stems from the fact that when positive LID occurs for some item pairs it is essentially equally balanced by negative LID, the presence of which has been ignored in papers discussing the effects of positive LID (Habing & Roussos, 2003).

Element 1.4.3. Test characteristics support intended interpretations about all students who take the MSAA.

Evidence: Evidence for 1.4.3 includes the following:

- Dimensionality: Dimensionality analysis was conducted on each grade-level test. Section 8.2 gives a detailed description of the hypothesis testing and effect size estimation methods. Results are summarized in a table accompanied by a description of the results. Grade 8 and high school showed a moderate level of Local Item Dependence (LID). Grade 5 shows a moderate to strong value of LID. The violations seem to be clearly related to examinee stringer behavior and not to any nuisance dimensions that could distort the unidimensional model. As described in the dimensionality section, any effects due to stringers are controlled by carefully limiting the number of items having the same key along any one item set.
- Test Information Functions: Chapter 9 provides a detailed description of the psychometric model that was fitted to the data. In particular, it describes the test information function (TIF), the most pertinent product of the psychometric model, in regard to evaluating the adequacy of the test. Appendix K shows the TIF graphs for all three grades of the MSAA Science. By examining the value of TIF at the performance level cuts (given in the graphs), the psychometric appropriateness of each test can be evaluated. As is evident in the TIFs in all grades, psychometric information is highest around the performance levels 1/2 and 2/3 cut scores. For all science grades, the TIF at these two cuts are either above or approaching the desire benchmark. This means that measurement precision and classification accuracy are maximized in the area of the scale where these cut scores are located and psychometric information about the students whose test performance locates them in that same area also is maximized. This targeting of information around the performance levels 1/2 and 2/3 cut scores is by design.

Relevance: Evidence is highly relevant.

Completeness: Evidence completeness is Moderate to Substantial.

Overall Support: Moderately supports the claim. The TIFs indicate that information functions are maximized at two different locations on the theta scale (i.e., the cut scores).

Possible Challenges: Cut 3 TIF is generally below the benchmark, this will be addressed by increasing the item pool each year.

Element 1.4.4. Scaling of the MSAA supports intended interpretations about all students who take the MSAA.

Evidence: Evidence for 1.4.4 includes the following:

- Differential item functioning (DIF) analyses: The scale used for reporting scores is assumed to be measuring only those constructs that are intended to be measured by each test. DIF analyses were conducted to detect items that may be measuring construct-irrelevant variance. Subgroup differences in item-level performance are examined when sample sizes permit. If an item is flagged, appropriate actions are taken to investigate whether the differences in performance are due to construct-irrelevant factors. A detailed description of the DIF analysis procedures is given in Chapter 8, along with a summary of the results. Detailed results are presented in Appendix I.
- Dimensionality: The scale used for reporting scores is a unidimensional scale. Dimensionality analysis was conducted for each grade-level test to examine the degree to which unidimensionality is evident. When the null hypothesis of unidimensionality is rejected, the dimensionality analysis quantifies the violation of unidimensionality and attempts to describe what may be causing the violation. Section 8.2 gives a detailed description of the hypothesis testing and effect size estimation methods. Results are summarized in a table accompanied by a description of the results. Mostly small to moderate violations of local independence were noted, and interpretations of these results were presented. The moderate violations and the few strong violations of local independence seem to be clearly related to aberrant student behavior (stringer effects), rather than to any nuisance dimensions.
- Calibration: The unidimensional scale used for reporting scores is based on an underlying unidimensional IRT model. The initial form of the IRT model is established by an initial calibration of the item response data. The calibration must be conducted accurately in order for the scaling to be appropriately implemented. Section 9.2 provides evidence that can be used to evaluate the effectiveness of the calibration. The evidence provided for the calibration procedure includes discussion of the removal of stringers and a description of how the convergence of the statistical calibration was evaluated.
- Model fit: After the initial calibration converged to a solution, the fit of the model was evaluated. Section 9.2 described how model fit was evaluated and the criteria that were used.

Relevance: The evidence is highly relevant.

Completeness: The evidence is complete.

Overall Support: Moderate to Strong.

Possible Challenges: Moderate to strong violations of local independence are a challenge to the label of strong support, but this challenge is counterbalance by the many analyses indicating goodness of fit of the unidimensional ICC's as well as a lack of any evidence that the strong violations are related to nuisance dimensions. In addition, the use of total score as the basis for scaling has been shown by research (Roussos, Li, & Lonczak; 2013) to result in only negligible underestimation of ability standard errors. Furthermore, an article by Ip (2010) demonstrates the empirical indistinguishability of multidimensional IRT and locally dependent unidimensional IRT models.

Element 1.4.5. Equating of MSAA test forms supports intended interpretations about MSAA students.

Evidence: Evidence to support 1.4.5 includes the following:

- This is the first year of the assessment, no equating work needed.

Relevance: NA

Completeness: Evidence is moderately complete. NA

Overall Support: NA

Possible Challenges: NA

Assumption 1.5. Item and test scoring in 2022 were implemented accurately.

Element 1.5.1. Machine-scored items were scored accurately.

Evidence: Machine-scorable MSAA items are submitted to a key verification process. As mentioned in Chapter 6, all the operational multiple-choice items are examined prior to score reporting to ensure that the option that was designated as the key was indeed the correct response.

Relevance: The evidence is highly relevant.

Completeness: Complete evidence.

Overall Support: Evidence strongly supports the claim.

Possible Challenges: None.

Assumption 1.6. MSAA Science scores correlate as expected with external indicators of student proficiency (i.e., concurrent evidence).

Element 1.6.1. MSAA Science scores correlate as expected with other measures of student proficiency.

Evidence: Peer reviewers acknowledge the challenge of acquiring additional evidence of student achievement that can be correlated with state alternate assessment scores, which they require for state grade-level assessments. As an alternative, peer reviewers do accept correlations that are internal to an alternate assessment as evidence in support of this assumption. (D. Peasley, personal communication to S. Ferrara, October 21, 2019.) The correlations between 2022 MSAA Science scale scores with the ELA and mathematics scores in grades 5, 8, and HS are listed in the table below.

Grade	Correlations	
	ELA and Science	Math and Science
5	0.87	0.83
8	0.89	0.81
HS	0.85	0.82

The strong positive values between the MSAA Science and the ELA and mathematics scale scores provide convergent validity evidence in the sense that they suggest that students' general academic and communicative capabilities are reflected strongly in both their MSAA Science, and their MSAA ELA and mathematics performances and scores.

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: Evidence provides limited support of the element.

Possible Challenges: The lack of external assessment to correlate with MSAA Science is a possible challenge.

11.2 Primary Intended Score Uses

11.2.1 Primary Intended Score Use 1

Schools and districts use the MSAA and its results to (a) monitor trends in student performance and (b) design professional development for teachers.

Assumption 2.1. MSAA Science scores enable teachers and school, district, and state leaders to monitor trends in student proficiency.

Element 2.1.1. MSAA Science scale scores for groups of students are adequately reliable and valid to enable school, district, and state leaders to monitor changes in means, standard deviations, and proficiency level percentages for classroom, school, district, and state groups.

Evidence: Evidence for the reliability and validity of the scores and the corresponding scoring processes is presented above under Assumptions 1.4 and 1.5 and in Chapters 6, Scoring, and 10, Reliability. Specifically:

- Evidence of individual score reliability in Section 10.1, IRT Marginal Reliability, is comparable to industry standards for grade-level educational achievement tests. The reliability of aggregated scores (e.g., means) usually is as high as or higher than individual score reliabilities (Brennan, 1995).
- Evidence presented in Appendix N and discussed in Section 10.2, Subgroup Reliability, indicates that reliability for some subgroups is strong. However, Section 10.2 discusses caveats in interpreting subgroup score reliability with caution because of the potential deleterious effects of small subgroup sizes on estimator standard error as well as possible severe restriction of range.
- No other aggregate score reliabilities (e.g., at the school level) exist.
- MSAA survey will be sent out to MSAA Science stakeholders to gauge their perceptions of using the MSAA results to monitor student performance as well as designing professional development.

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: Evidence moderately supports the claim.

Possible Challenges: Possible additional evidence is discussed under Assumptions 1.4, 1.5, and 1.6. Additional information will be collected a few years into the MSAA Science testing cycle.

Element 2.1.2. MSAA Science scores and proficiency level categorizations of groups of students are adequately reliable and valid to enable monitoring of grade-level performance and student cohort performance.

Evidence: Evidence for the reliability and validity of proficiency level categorizations is presented above under Assumption 1.4. The most pertinent evidence follows.

- Performance level classification consistency and accuracy estimates: Accuracy is an estimate of the probability that the observed classification is the true classification. Consistency is an estimate of the probability that students would receive the same classification if they tested twice on parallel forms. Section 10.4 describes the theory and equations underlying the estimation of classification accuracy and consistency, while also reporting summary statistics. Detailed results are provided in Appendix O.

Relevance: The evidence is highly relevant.

Completeness: Complete Evidence.

Overall Support: The evidence strongly supports the element.

Possible Challenges: Additional survey information will be collected a few years into the MSAA Science testing cycle.

Element 2.1.3. The relationship between MSAA Science scores and external measures of student achievement and growth is as expected, compared to grade-level assessments and other measures of student achievement.

Evidence: The internal correlations between 2022 MSAA Science with ELA and mathematics scores for grades 5, 8, and HS are listed in the correlation table in Element 1.6.1. These correlations indicate a moderate to strong relationship between MSAA Science scores with ELA and mathematics scores, which is reasonably consistent with correlations observed between grade-level state assessments and external measures (e.g., local interim assessments). They suggest that MSAA Science scores enable teachers and school, district, and state leaders to monitor trends in student achievement as when, for example, student achievement in both content areas either progress similarly, or do not progress similarly.

Internal correlations are accepted as evidence for critical element 3.4, specifically for alternate assessments, because of the difficulties in collecting additional, external assessment evidence on students with significant cognitive disabilities (D. Peasley, personal communication to S. Ferrara, October 17, 2019).

Relevance: The evidence is highly relevant.

Completeness: Moderate to Substantial Evidence.

Overall Support: Evidence moderately supports the element.

Possible Challenges: Collecting additional evidence to correlate MSAA Science with external assessment.

Assumption 2.2. MSAA Science results are used to design professional development for teachers.

Evidence: States provide guidance to local districts to promote and guide professional development for teachers. For example, the Arizona Department of Education provides a document called How to Teach the State Standards to Students Who Take Alternate Assessments.

<https://cms.azed.gov/home/GetDocumentFile?id=5866dbe1aadebe085c4de5b4>

Summary of evidence: Limited Evidence; an example of additional evidence would be a survey of LEAs to begin to understand the degree to which MSAA-based professional development is implemented. Additional professional development materials from other science partners will help support the body of evidence for this claim.

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: Additional Evidence needed; an example of additional evidence would be a survey of LEAs to begin to understand the degree to which MSAA-based professional development is implemented.

11.2.2 Primary Intended Score Use 2

The MSAA and its results are used to help teachers integrate MSAA scores and other information into their instructional planning.

Assumption 3.1. Teachers use the MSAA Science and its results to better integrate assessment with their instructional planning.

Element 3.1.1. Teachers find the performance level descriptors and their students' performance levels useful for planning instruction, especially students in performance levels 1 and 2.

Evidence: Annual compliance monitoring of IEPs in all states indicates that special education teachers refer to PLDs to establish present levels of performance and to inform goals. For example, the Arizona Department of Education guidance on IEP-required components requires that “The IEP includes measurable annual goals, including academic and functional goals that reflect the needs identified in the PLAAFP and current assessment data” (p. D40; see <https://cms.azed.gov/home/GetDocumentFile?id=5b2a897d1dcb250f1c55e5b3>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: The current evidence only support the year 1 use of the assessment. Additional Evidence needed; an example of additional evidence would be a survey of teachers to begin to understand the degree to which teachers find MSAA Science scores and other MSAA-based information useful for planning instruction.

Element 3.1.2. Teachers find their students' scale score information useful for planning instruction, especially students in Levels 1 and 2.

Evidence: Annual compliance monitoring of IEPs in all states suggests that special education teachers refer to PLDs to establish present levels of performance and to inform goals. For example, the Arizona Department of Education guidance on IEP required components requires that “The IEP includes measurable annual goals, including academic and functional goals that reflect the needs identified in the PLAAFP and current assessment data” (p. D40; see <https://cms.azed.gov/home/GetDocumentFile?id=5b2a897d1dcb250f1c55e5b3>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: Additional Evidence needed; an example of additional evidence could be a survey of teachers to begin to understand the degree to which teachers find MSAA Science scores useful for planning instruction.

Assumption 3.2. Teachers use MSAA Science scores and other information for instructional planning.

Element 3.2.1. Teachers use MSAA Science scores and other information for planning instruction.

Evidence: Annual compliance monitoring of IEPs in all states indicates that special education teachers refer to PLDs to establish present levels of performance and to inform goals. For example, the Arizona Department of Education guidance on IEP required components requires that “The IEP includes measurable annual goals, including academic and functional goals that reflect the needs identified in the PLAAFP and current assessment data” (p. D40; see <https://cms.azed.gov/home/GetDocumentFile?id=5b2a897d1dcb250f1c55e5b3>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: Additional Evidence needed; an example of additional evidence could be a survey of teachers to begin to understand the degree to which teachers use MSAA Science scores and other MSAA-based information for planning instruction.

11.2.3 Primary Intended Score Use 3

Parents use the MSAA and its results to get information about (a) what their child knows and can do, and (b) their child's progress from year to year.

Assumption 4.1. Parents find MSAA Science scores and other information useful for understanding what their child knows and can do.

Element 4.1.1. Parents understand and interpret correctly MSAA Science scores and other information to understand what their child knows and can do.

Evidence: For this first year of the assessment, MSAA provides information to guide parents in interpreting and using MSAA scores and other information about their child's achievement and learning needs. For example, the Arizona Department of Education sends to districts a Parent Overview to accompany each child's Individual Score Report. The overviews are available online in both English and Spanish (see <https://www.azed.gov/assessment/parents>). Similarly, the Maine Department of Education provides the Parent Overview of the MSAA Assessment System (see <https://www.maine.gov/doe/sites/maine.gov.doe/files/inline-files/2016ParentOverview-allgradescombined.pdf>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element,

Possible Challenges: Currently, the feedback from parents regarding the score interpretation and clarity of the score reports are lacking. an example of additional evidence could be a survey of parents to begin to understand the degree to which parents correctly understand and interpret MSAA Science scores and other MSAA-based information to understand what their child knows and can do.

Element 4.1.2. Parents use MSAA Science scores and other information appropriately to understand what their child knows and can do and make decisions about their child's education and learning needs.

Evidence: MSAA provides information to guide parents in interpreting and using MSAA Science scores and other information about their child's achievement and learning needs. For example, the Arizona Department of Education sends to districts a Parent Overview to accompany each child's Individual Score Report. The overviews are available online in both English and Spanish (see <https://www.azed.gov/assessment/parents>). Similarly, the Maine Department of Education provides the Parent Overview of the MSAA Assessment System (see <https://www.maine.gov/doe/sites/maine.gov.doe/files/inline-files/2016ParentOverview-allgradescombined.pdf>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element

Possible Challenges: Additional evidence needed; An example of additional evidence could be a survey of parents to begin to understand the degree to which parents use MSAA Science scores and other MSAA-based information to understand what their child knows and can do.

Assumption 4.2. Parents find MSAA Science scores and other information useful for understanding their child’s progress across grades.

Element 4.2.1. Parents understand and interpret correctly MSAA Science scores and other information to understand their child’s progress across grades.

Evidence: For the very first year of MSAA Science results, MSAA provides information to guide parents in interpreting and using MSAA Science scores and other information about their child’s achievement and learning needs. For example, the Arizona Department of Education sends to districts a Parent Overview to accompany each child’s Individual Score Report. The overviews are available online in both English and Spanish (see <https://www.azed.gov/assessment/parents>). Similarly, the Maine Department of Education provides the Parent Overview of the MSAA Assessment System (see <https://www.maine.gov/doe/sites/maine.gov.doe/files/inline-files/2016ParentOverview-allgradescombined.pdf>).

Relevance: The evidence is moderately relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: This is the first year of the assessment, Additional evidence needed; an example of additional evidence could be a survey of parents to begin to understand the degree to which parents correctly understand and interpret MSAA Science scores and other MSAA-based information to understand their child’s progress from year to year.

Element 4.2.2. Parents use MSAA Science scores and other information appropriately to understand their child’s progress across grades and make decisions about their child’s education and learning needs.

Evidence: MSAA provides information to guide parents in interpreting and using MSAA Science scores and other information about their child’s achievement and learning needs. For example, the Arizona Department of Education sends to districts a Parent Overview to accompany each child’s Individual Score Report. The overviews are available online in both English and Spanish (see <https://www.azed.gov/assessment/parents>). Similarly, the Maine Department of Education provides the Parent Overview of the MSAA Assessment System (see <https://www.maine.gov/doe/sites/maine.gov.doe/files/inline-files/2016ParentOverview-allgradescombined.pdf>).

Relevance: The evidence is highly relevant.

Completeness: Limited Evidence.

Overall Support: The evidence moderately supports the element.

Possible Challenges: Additional evidence needed; An example of additional evidence could be a survey of parents to begin to understand the degree to which parents use MSAA Science scores and other MSAA-based information to understand their child’s progress from year to year.

11.3 Conclusions

Since 2022 is the first year of the MSAA Science assessment, many assumptions and associated elements have limited or moderate evidence. However, both the quantity and quality of the evidence are expected to improve in the following years.

The MSAA Psychometrics and Test Construction Subcommittee, which included committee members from the MSAA Science Partners, has developed and will implement a research agenda to develop evidence where it currently is missing or weak.

These assumptions and elements comprise the validity arguments for MSAA scores. Tables 11-3–11-5 summarize the rating scale for each assumption and element. The tables indicate the following:

Primary Score Intended Score Interpretation

MSAA scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining. Of the 21 assumptions and elements that support the intended score interpretation,

- 17 sets of evidence are highly relevant, 2 sets of evidence are moderately relevant, 0 sets of evidence are open to reasonable rebuttal or debate for the relevance rating scale.
- 8 sets of evidence are complete evidence, 7 sets of evidence are moderate to substantial evidence, 4 sets of evidence are limited evidence, and 0 sets of evidence are not relevant.
- 12 sets of evidence strongly support the claim or element, 2 sets of evidence moderately support the claim or element, 4 sets of evidence provide limited support to the claim or element, 0 sets of evidence do not support the claim or do not exist.

Intended Score Use 1

Schools and districts use the MSAA and its results to (a) monitor trends in student performance and (b) design professional development for teachers. Of the four assumptions and elements that support intended score use 1:

- 2 sets of evidence are highly relevant, and 2 sets of evidence are moderately relevant.
- 1 set of evidence is complete evidence, 1 set of evidence is moderate to substantial evidence, and 2 sets of evidence are limited evidence.
- 0 sets of evidence strongly support the claim or element, 4 sets of evidence moderately support the claim or element, and 0 sets of evidence provide limited support to the claim or element.

Intended Score Use 2

Teachers use the MSAA and its results to better integrate assessment with their instructional planning. Of the three assumptions and elements that support intended score use 2:

- 3 sets of evidence are moderately relevant.
- 3 sets of evidence are limited evidence.
- 3 sets of evidence moderately support the claim or element.

Intended Score Use 3

Parents use the MSAA and its results to get information about (a) what their child knows and what their child can do and (b) their child's progress from year to year. Of the four assumptions and elements that support intended score use 3:

- 1 set of evidence is highly relevant, and 3 sets of evidence are moderately relevant.
- 4 sets of evidence are limited evidence.
- 4 sets of evidence moderately support the claim or element.

Table 11-2. Status of Relevance of the Evidence for All Four SIUs, Assumptions, and Elements

Element	Highly Relevant	Moderately Relevant	The relevance of the evidence is open to reasonable rebuttal or debate
Primary Intended Score Interpretation			
MSAA scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining.			
1.1.1. The Extended Performance Expectations are aligned to the standards (aka, Performance Expectations) from A Framework for K-12 Science Education and, as such, aligned to each partner’s academic content standards for each grade level.	X		
1.1.2. The 2022 MSAA Science items are aligned to the Extended Performance Expectations.	X		
1.1.3. The MSAA Science partners have confirmed that the Science Extended Performance Expectations, which are assessed on the MSAA Science, are aligned with each partner’s academic content standards for each grade level.	X		
1.1.4. The 2022 operational MSAA Science items are aligned to the MSAA performance level descriptors.		X	
1.2.1. Items require application of the KSAs of the targeted construct.	X		
1.2.2. Items are accessible to all students.	X		
1.2.3. Appropriate accommodations are provided to meet student needs.	X		
1.2.4. Scaffolding is not a source of construct-irrelevant variance.	X		
1.2.5. Item rendering does not interfere with student access to test content.	X		
1.2.6. Platform does not interfere with student interaction with test content.	X		
1.2.7. Items are free of bias and sensitive issues.	X		
1.3.1. Test Administrators and School and District Coordinators understood and performed their roles properly.	X		
1.3.2. Test security concerns were limited.	X		
1.4.1. MSAA scores and categorizations into provisional performance levels are adequately reliable for their intended purpose.	X		
1.4.2. Item characteristics support intended interpretations about all students who take the MSAA.	X		
1.4.3. Test characteristics support intended interpretations about all students who take the MSAA.	X		
1.4.4. Scaling of the MSAA supports intended interpretations about all students who take the MSAA.	X		
1.4.5. Equating of MSAA test forms supports intended interpretations about MSAA students.			
1.5.1. Machine-scored items were scored accurately.	X		
1.6.1. MSAA scores correlate as expected with other measures of student proficiency.			X
Primary Intended Score Use 1			
Schools and districts use the MSAA and its results to (a) monitor trends in school performance and (b) design professional development for teachers how to monitor trends.			
2.1.1. MSAA Science scale scores for groups of students are adequately reliable and valid to enable school, district, and state leaders to monitor changes in means, standard deviations, and proficiency level percentages for classroom, school, district, and state groups.		X	

continued

Element	Highly Relevant	Moderately Relevant	The relevance of the evidence is open to reasonable rebuttal or debate
2.1.2. MSAA Science scores and proficiency level categorizations of groups of students are adequately reliable and valid to enable monitoring of grade-level performance and student cohort performance.	X		
2.1.3. The relationship between MSAA Science scores and external measures of student achievement and growth is as expected, compared to grade-level assessments and other alternate assessments.	X		
2.2 (Assumption) MSAA Science results are used to design professional development for teachers.		X	
Primary Intended Score Use 2 The MSAA and its results are used to help teachers integrate MSAA scores and other information with their instructional planning.			
3.1.1. Teachers find the performance level descriptors and their students' performance levels useful for planning instruction, especially students in performance levels 1 and 2.		X	
3.1.2. Teachers find their students' scale score information useful for planning instruction, especially students in levels 1 and 2.		X	
3.2.1. Teachers use MSAA Science scores and other information for planning instruction.		X	
Primary Intended Score Use 3 Parents understand and interpret MSAA scores and other information correctly to understand what their child knows and can do.			
4.1.1. Parents understand and interpret correctly MSAA Science scores and other information to understand what their child knows and can do.		X	
4.1.2. Parents use MSAA Science scores and other information appropriately to understand what their child knows and can do and make decisions about their child's education and learning needs.		X	
4.2.1. Parents understand and interpret correctly MSAA Science scores and other information to understand their child's progress across grades.		X	
4.2.2. Parents use MSAA Science scores and other information appropriately to understand their child's progress across grades and make decisions about their child's education and learning needs.	X		

Table 11-3. Status of Completeness of the Evidence that Supports All Four SIUs, Assumptions, and Elements

Element	Completeness of the Evidence to the Element			
	Complete Evidence	Moderate to Substantial Evidence	Limited Evidence	No Evidence
Primary Intended Score Interpretation				
MSAA scores provide reliable and valid information about important knowledge and skills in elementary, middle, and high school multidimensional science concepts that students with the most significant cognitive disabilities are attaining.

Appendices

APPENDIX—A
ACCOMMODATION FREQUENCIES

Table A-1. Accommodation Frequencies

Accommodations	Grades		
	5	8	11
LCI_Vision ¹	65	78	59
SAR_Assistive_Response_After ²	136	175	120
SAR_No_Accomm_Needed_After ³	218	197	233
SAR_Paper_Version_After ⁴	52	47	47
SAR_Scribe_After ⁵	191	186	102
SAR_Sign_Interpretation_After ⁶	13	11	8

1: LCI_Vision - Input could occur through alternate keyboards, eye-gaze, switch devices, speech-to-text, and other similar input devices. Students are also expected to access text using AT devices (e.g., screen readers), but refreshable Braille display is not supported for presentation of text-based content for the first operational year.

2: SAR_Assistive_Response_After - Assistive Technology (AT) for viewing, responding, or interacting with test items.

3: SAR_No_Accomm_Needed_After - No accommodations needed.

4: SAR_Paper_Version_After - Paper version of item/s.

5: SAR_Scribe_After - A scribe will enter in the MSAA Online Assessment System the student-indicated answer to a selected-response item. For the constructed-response writing item, the scribe will record the student's response to the writing prompt on the response templates in the MSAA Online Assessment System.

6: SAR_Sign_Interpretation_After - TA may communicate passages, items and response options using sign language to student.

APPENDIX—D

**DETAILED CONTENT RATIONALE FOR PERFORMANCE
EXPECTATION SELECTION FOR ALL GRADES**

AND

**ELEMENTARY GRADE-LEVEL
EXTENDED PERFORMANCE EXPECTATIONS
EXAMPLE**

The Cognia development team followed a principled assessment design process and utilized the published national resources of the *Framework* and NGSS. As outlined in Ferrara, Lai, Reilly, and Nichols (2016), "principled approaches provide concepts, procedures, and tools to guide assessment design, development, and implementation decisions" (pg. 3). The test design and test blueprint provided the guardrails for the selection of the Performance Expectations (PEs) and creation of the Extended Performance Expectations (EPEs).

The table below shows the content blueprint for the operational test for each grade band. The test blueprint for each grade in Appendix F incorporates the overall content distributions used for the development of the operational tests.

Table D-1. Blueprint for Distribution of Science Content by Grade Level

Science Content Category	Grade 5	Grade 8	HS
Physical Sciences	~40%	30-40%	30-40%
Life Sciences	~30%	30-40%	30-40%
Earth and Space Sciences	~30%	~30%	~30%

The selected standards assessable within each category, and the rationale for their selection, are further explained in the next part of this appendix. Following detail about the PE selection rationale an example of the EPEs along with an explanation of the major layout components is provided.

For the grade 5 test, PEs from grades 3, 4, and 5 are included; the progression of standards in those grades is such that to provide a solid representation of the core ideas and understandings students need to progress from elementary school to middle school, PEs needed to be selected across grade bands. The table below shows the collection of PEs chosen to be assessed on the grade 5 test.

Table D-2. Selected Performance Expectations for Grade 5 Test

Performance Expectation (PE)	DCI	SEP	CCC
5-PS1-2. Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.	PS1.A Structure and Properties of Matter PS1.B Chemical Reactions	Using Mathematics and Computational Thinking	Scale, Proportion, and Quantity
3-PS2-2. Make observations and/or measurements of an object's motion to provide evidence that a pattern can be used to predict future motion.	PS2.A Forces and Motion	Planning and Carrying Out Investigations	Patterns
5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.	PS2.B Types of Interactions	Engaging in Argument from Evidence	Cause and Effect
4-PS3-4. Apply scientific ideas to design, test, and refine a device that converts energy from one form to another. *	PS3.B Conservation of Energy and Energy Transfer PS3.D Energy in Chemical Processes and Everyday Life ETS1.A Defining and Delimiting an Engineering Problem	Designing Solutions	Energy and Matter
5-PS3-1. Use models to describe that energy in animals' food (used for body repair, growth, and motion, and to maintain body warmth) was once energy from the sun. ¹	PS3.D Energy in Chemical Processes and Everyday Life	Developing and Using Models	Energy and Matter

continued

Performance Expectation (PE)	DCI	SEP	CCC
4-LS1-1. Construct an argument that plants, and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.	LS1.A Structure and Function	Engaging in Argument from Evidence	Systems and System Models
3-LS3-1. Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms.	LS3.A Inheritance of Traits LS3.B Variation of Traits	Analyzing and Interpreting Data	Patterns
3-LS4-1. Analyze and interpret data from fossils to provide evidence of the organisms and environments in which they lived long ago.	LS4.A Evidence of Common Ancestry and Diversity	Analyzing and Interpreting Data	Scale, Proportion, and Quantity
5-ESS1-2. Represent data in graphical displays to reveal patterns of daily changes in the length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.	ESS1.B Earth and the Solar System	Analyzing and Interpreting Data	Patterns
3-ESS2-1. Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.	ESS2.D Weather and Climate	Analyzing and Interpreting Data	Patterns
5-ESS2-1. Develop a model using an example to describe ways in which the geosphere, biosphere, hydrosphere, and/or atmosphere interact.	ESS2.A Earth Materials and Systems	Developing and Using Models	Systems and System Models
5-ESS3-1. Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.	ESS3.C Human Impacts on Earth Systems	Obtaining, Evaluating, and Communicating Information	Systems and System Models

**PEs marked with an asterisk incorporate Engineering constructs.*

¹This PE crosses Physical Sciences and Life Sciences. It will be classified in Life Sciences in fulfilling the blueprint distribution.

For the grade 5 test, PEs were chosen from grades 3-5 to generate the best representation of broad, fundamental principles for the elementary grade assessment. Because the NGSS spread science topics out across grades in the 3-5 grade band, there are some key content ideas for forces and motion, as well as heredity, biological evolution, and weather, that only appear in standards at grade 3. Although the test is targeted for administration to students in grade 5, four grade 3 PEs were included to ensure focus on all foundational areas that students would need exposure to, to prepare for middle school expectations:

- 3-PS2-2 focuses on basic patterns of motion, as a foundation of the cause-and-effect exploration of forces and motion. This PE also provides an opportunity to expose students to the various types of forces, from physical contact forces to gravity and magnetism, linking to another motion/forces PE within elementary and to other motion/forces PEs in later grades.
- 3-LS3-1 introduces the fundamental principle of inheritance of traits (traits pass from parents to offspring) as well as the idea of variation, which are both cornerstones of the study of genetics and biological evolution.
- 3-LS4-1 provides an accessible foundation for thinking about evidence of organisms' fit to the environment, and changes in organisms and environments over time.
- 3-ESS2-1 focuses on the most foundational understandings of weather, which are then extended in other elementary PEs and in later grades in studying interactions of Earth's systems, geoscience processes changing Earth's surface, water cycling through Earth's systems, and the larger concept of climate.

It should also be noted that while the chosen PEs may seem to lean more heavily to Physical Sciences than Life Sciences (5 PEs coded to Physical Sciences and only 3 PEs coded to Life Sciences), PE 5-PS3-1 is a “crossover” PE that connects the physical science concept of energy in everyday life with the life science concept of matter and energy flow. Although 5-PS3-1 has a physical science coding, it would typically be taught within an ecology unit (and is therefore classified as a Life Science PE in the test blueprint).

Additionally, it may be noted that there are no PEs in the elementary grade test for Physical Sciences DCI PS4, Waves and Their Application in Technologies for Information Transfer. The concept of waves is abstract and is therefore viewed as more appropriate to address in the grade 8 test than in this grade band for students with significant cognitive disabilities. Likewise in Life Sciences, although no performance expectation is explicitly aligned to DCI LS2 (Ecosystems: Interactions, Energy, and Dynamics), PE 5-PS3-1 actually overlaps heavily with these concepts. All other DCIs are represented in the elementary grade test. The table below, shows the DCIs included in the grade 5 test.

Table D-3. Disciplinary Core Idea Summary for Grade 5 Test

<i>Physical Sciences</i>													
PS1.A	PS1.B	PS1.C	PS2.A	PS2.B	PS2.C	PS3.A	PS3.B	PS3.C	PS3.D	PS4.A	PS4.B	PS4.C

<i>Engineering Design</i>													
ETS1.A	ETS1.B	ETS1.C											
X													

The representation of SEPs and CCCs across the selected PEs was also reviewed to ensure most, if not all, SEPs and CCCs were included for each grade test. Likewise, one or two engineering-aligned PEs were included in the selected PEs for each grade test, as engineering constructs are included in the *Framework* as both SEPs and DCIs. As can be seen in Table D-2, in the grade 5 test, the selected PEs incorporate seven of the eight SEPs and five of the seven CCCs (with the other two CCCs not actually included in the elementary grade band in NGSS standards). There is also one engineering-aligned PE included, 4-PS3-4.

For the grade 8 test, four PEs were selected per content domain. The PEs were chosen from the middle school grade band to generate the best representation of important principles that bridge the elementary and high school grades, and that are accessible and relevant for this student population. The table below shows the collection of PEs chosen to be assessed on the grade 8 test.

Table D-4. Selected Performance Expectations for Grade 8 Test

Performance Expectation (PE)	DCI	SEP	CCC
MS-PS1-2. Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred.	PS1.A Structure and Properties of Matter PS1.B Chemical Reactions	Analyzing and Interpreting Data	Patterns
MS-PS2-2. Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.	PS2.A Forces and Motion	Planning and Carrying Out Investigations	Stability and Change
MS-PS3-5. Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.	PS3.B Conservation of Energy and Energy Transfer	Engaging in Argument from Evidence	Energy and Matter
MS-PS4-2. Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.	PS4.A Wave Properties PS4.B Electromagnetic Radiation	Developing and Using Models	Structure and Function
MS-LS1-3. Use argument supported by evidence for how the body is a system of interacting sub-systems composed of groups of cells.	LS1.A Structure and Function	Engaging in Argument from Evidence	Systems and System Models
MS-LS1-5. Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms.	LS1.B Growth and Development of Organisms	Constructing Explanations	Cause and Effect
MS-LS2-1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.	LS2.A Interdependent Relationships in Ecosystems	Analyzing and Interpreting Data	Cause and Effect
MS-LS2-3. Develop a model to describe the cycling of matter and flow of energy among living and non-living parts of an ecosystem.	LS2.B Cycle of Matter and Energy Transfer in Ecosystems	Developing and Using Models	Energy and Matter
MS-ESS1-1. Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.	ESS1.A The Universe and Its Stars ESS1.B Earth and the Solar System	Developing and Using Models	Patterns
MS-ESS2-2. Construct an explanation based on evidence for how geoscience processes have changed Earth's surface at varying time and spatial scales.	ESS2.A Earth Materials and Systems ESS2.C The Role of Water in Earth's Surface Processes	Constructing Explanations	Scale, Proportion, and Quantity
MS-ESS2-4. Develop a model to describe the cycling of water through Earth's systems driven by energy from the sun and the force of gravity.	ESS2.C The Role of Water in Earth's Surface Processes	Developing and Using Models	Energy and Matter
MS-ESS3-3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.*	ESS3.C Human Impacts on Earth Systems ETS1.A Defining and Delimiting an Engineering Problem	Designing Solutions	Cause and Effect

Across the content domains, choices for representation of important principles that bridge the elementary and high school grades, and that are accessible and relevant for this student population, include the following:

- In Physical Sciences, DCI PS4 (Waves and Their Application in Technologies for Information Transfer) – which was not assessed in the grade 5 test – is now addressed with an accessible, grade-appropriate standard (MS-PS4-2) focused on reflection, absorption, and transmission of waves through materials.
- In Life Sciences, PEs for DCIs LS3 and LS4 are not included. A strong focus on body systems and growth (DCI LS1) and ecological principles (DCI LS2) is viewed as more accessible and relevant for students in the middle grades than emphases for heredity (LS3) and biological

evolution (LS4) in this grade band. Many of the middle-grade PEs for LS3 and LS4 are conceptually difficult and abstract. Rather than deconstruct these PEs down to a point that provides less-than-optimal learning and development opportunity for students, these PEs have not been prioritized at the middle school level. The LS3 and LS4 core ideas are being addressed grade-appropriately in the high school tests.

As shown in table below, concepts for all DCIs are included in the grade 8 test with the exception of LS3 and LS4, as explained above.

The representation of SEPs and CCCs across the selected PEs was also reviewed to ensure most, if not all, SEPs and CCCs were included for each grade. Likewise, one or two engineering-aligned PEs were included in the selected PEs for each grade test, as engineering constructs are included in the *Framework* as both SEPs and DCIs. As can be seen in Table D-4, in the grade 8 test, the selected PEs incorporate five of the eight SEPs and all seven of the CCCs. For the SEPs, there was a trade-off of optimizing coverage of key content ideas and coverage of Practices, and key content coverage was prioritized. Using Mathematics and Computational Thinking is not represented for the highest access point for grade 8, as the focal skills of that Practice that would be most appropriate for students with significant cognitive disabilities heavily overlap those of the SEP Analyzing and Interpreting Data. The SEP Asking Questions and Defining Problems and the SEP Obtaining, Evaluating, and Communicating Information do not appear very frequently in the middle school PEs compared to the other PEs. To include engineering, there is also one engineering-aligned PE included, MS-ESS3-3.

For the grade 11 test, four PEs were selected per content domain. The PEs were chosen from the high school grade band to generate the best representation of important culminating understandings that are accessible and relevant for this student population. The table below shows the collection of PEs chosen to be assessed on the grade 11 test.

Table D-6. Selected Performance Expectations for Grade 11 Test

Performance Expectation (PE)	DCI	SEP	CCC
HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.	PS1.A Structure and Properties of Matter PS1.B Chemical Reactions	Constructing Explanations	Patterns
HS-PS2-3. Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.*	PS2.A Forces and Motion ETS1.A Defining and Delimiting an Engineering Problem ETS1.C Optimizing the Design Solution	Designing Solutions	Cause and Effect
HS-PS2-5. Plan and conduct an investigation to provide evidence that an electrical current can produce a magnetic field and that a changing magnetic field can produce an electrical current.	PS2.B Types of Interactions PS3.A Definitions of Energy	Planning and Carrying Out Investigations	Cause and Effect
HS-PS3-2. Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative positions of particles (objects).	PS3.A Definitions of Energy	Developing and Using Models	Energy and Matter
HS-LS2-2. Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.	LS2.A Interdependent Relationships in Ecosystems	Using Mathematics and Computational Thinking	Scale, Proportion, and Quantity
HS-LS3-1. Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.	LS3.A Inheritance of Traits LS1.A Structure and Function	Asking Questions	Cause and Effect
HS-LS4-1. Communicate scientific information that common ancestry and biological evolution are supported by multiple lines of empirical evidence.	LS4.A Evidence of Common Ancestry and Diversity	Obtaining, Evaluating, and Communicating Information	Patterns
HS-LS4-3. Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait.	LS4.B Natural Selection LS4.C Adaptation	Analyzing and Interpreting Data	Patterns
HS-ESS1-6. Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.	ESS1.C The History of Planet Earth	Constructing Explanations	Stability and Change
HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.	ESS1.B Earth and the Solar System ESS2.A Earth Materials and Systems ESS2.D Weather and Climate	Developing and Using Models	Cause and Effect
HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.	ESS2.C The Role of Water in Earth's Surface Processes	Planning and Carrying Out Investigations	Structure and Function
HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.*	ESS3.C Human Impacts on Earth Systems ETS1.B Developing Possible Solutions	Designing Solutions	Stability and Change

In Physical Sciences, DCI PS4 (Waves and Their Application in Technologies for Information Transfer) is addressed with many PEs that are extended topics and very abstract, and thus was not prioritized for this population of students compared to other content within the Physical Sciences. Foundational concepts for waves are covered in the middle grade band instead. Concepts for all other DCIs in each domain are included in the grade 11 test, as shown in the table below.

The representation of SEPs and CCCs across the selected PEs was also reviewed to ensure most, if not all, SEPs and CCCs were included for each grade. Likewise, one or two engineering-aligned PEs were included in the selected PEs for each grade test, as engineering constructs are included in the *Framework* as both SEPs and DCIs. As can be seen in Table D-6, in the grade 11 test, the selected PEs incorporate seven of the eight SEPs and six of the seven CCCs. The only SEP that is not represented for the highest access point for high school is Engaging in Argument from Evidence. This Practice is included in less than 1/8 of the PEs in the high school grade band, and key content coverage was prioritized over Practices in this case. The only CCC not included is Systems and System Models; however, because two of the PEs (HS-PS3-2 and HS-ESS2-4) integrate the Practice of Developing and Using Models, students will be applying systems thinking in those cases as well. In high school, there are also 2 engineering-aligned PEs included, HS-PS2-3 and HS-ESS3-4.

As PEs were selected and finalized for each grade band, the progression of DCIs across all grades was checked to help validate the appropriateness of the collection of PEs chosen for assessment on each grade’s test. The tables below show an example of the final prioritized PEs and associated DCIs for the Physical Sciences across all three grades, followed by the same information for Life Science and Earth and Space Sciences.

Table D-8. Selected Performance Expectations for Physical Science Across Grades 5, 8, and HS

Grade	Performance Expectation (PE)	DCI
5	5-PS1-2. Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.	PS1.A PS1.B
	3-PS2-2. Make observations and/or measurements of an object's motion to provide evidence that a pattern can be used to predict future motion.	PS2.A
	5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.	PS2.B
	4-PS3-4. Apply scientific ideas to design, test, and refine a device that converts energy from one form to another. *	PS3.B PS3.D ETS1.A
	MS-PS1-2. Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred.	PS1.A PS1.B
8	MS-PS2-2. Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.	PS2.A
	MS-PS3-5. Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.	PS3.B
	MS-PS4-2. Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.	PS4.A PS4.B
	HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.	PS1.A PS1.B
HS	HS-PS2-3. Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision. *	PS2.A ETS1.A ETS1.C
	HS-PS2-5. Plan and conduct an investigation to provide evidence that an electrical current can produce a magnetic field and that a changing magnetic field can produce an electrical current.	PS2.B PS3.A
	HS-PS3-2. Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative positions of particles (objects).	PS3.A

*PEs marked with an asterisk incorporate Engineering constructs.

Grade HS	X	X		X	X		X						

Ultimately, the selected PEs within and across grades represent a content progression supporting essential learning and understandings in the Physical Sciences. The constructs of structure and properties of matter, chemical reactions, forces and motion, types of interactions, and conservation and transfer of energy are all well-represented across the grade bands. Additionally, basic understanding of waves and their behavior is included in grade 8.

Table D-10. Selected Performance Expectations for Life Science Across Grades 5, 8, and HS

Grade	Performance Expectation (PE)	DCI
5	5-PS3-1. Use models to describe that energy in animals' food (used for body repair, growth, and motion, and to maintain body warmth) was once energy from the sun. ¹	PS3.D LS1.C
	4-LS1-1. Construct an argument that plants and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.	LS1.A
	3-LS3-1. Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms.	LS3.A LS3.B
	3-LS4-1. Analyze and interpret data from fossils to provide evidence of the organisms and environments in which they lived long ago.	LS4.A
8	MS-LS1-3. Use argument supported by evidence for how the body is a system of interacting sub-systems composed of groups of cells.	LS1.A
	MS-LS1-5. Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms.	LS1.B
	MS-LS2-1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.	LS2.A
	MS-LS2-3. Develop a model to describe the cycling of matter and flow of energy among living and non-living parts of an ecosystem.	LS2.B
HS	HS-LS2-2. Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.	LS2.A
	HS-LS3-1. Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.	LS3.A LS1.A
	HS-LS4-1. Communicate scientific information that common ancestry and biological evolution are supported by multiple lines of empirical evidence.	LS4.A
	HS-LS4-3. Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait.	LS4.B LS4.C

¹While this PE is coded to Physical Sciences, it crosses Physical Sciences and Life Sciences. It is being counted in Life Sciences in fulfilling the blueprint distribution, as the construct would most frequently be taught in an ecology unit.

Table D-11. Disciplinary Core Idea Coverage for Life Sciences Across Grades 5, 8, and HS

Life Sciences Disciplinary Core Idea (DCI) Coverage Across Grades														
	LS1.A	LS1.B	LS1.C	LS1.D	LS2.A	LS2.B	LS2.C	LS2.D	LS3.A	LS3.B	LS4.A	LS4.B	LS4.C	LS4.D
Grade 5	X		X						X	X	X			
Grade 8	X	X			X	X								
Grade HS	X				X				X		X	X	X	

The selected PEs within and across grades represent a content progression supporting essential learning and understandings in the Life Sciences. While some DCIs get more emphasis in some grade bands than in others, the specific PEs selected for the assessments help to establish big ideas that bridge students across DCI areas as they progress through the grades. For example, in the grade 8 test, although no PEs aligned to DCI LS3 (Heredity) are assessed, the PE MS-LS1-5 includes genetic factors and thus still gives students exposure to that topic between the elementary and high school grades where specific PEs aligned to DCI LS3 are included.

Table D-12. Selected Performance Expectations for Earth and Space Science Across Grades 5, 8, and HS

Grade	Performance Expectation (PE)	DCI
5	5-ESS1-2. Represent data in graphical displays to reveal patterns of daily changes in the length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.	ESS1.B
	3-ESS2-1. Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.	ESS2.D
	5-ESS2-1. Develop a model using an example to describe ways in which the geosphere, biosphere, hydrosphere, and/or atmosphere interact.	ESS2.A
	5-ESS3-1. Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.	ESS3.C
8	MS-ESS1-1. Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.	ESS1.A ESS1.B
	MS-ESS2-2. Construct an explanation based on evidence for how geoscience processes have changed Earth's surface at varying time and spatial scales.	ESS2.A ESS2.C
	MS-ESS2-4. Develop a model to describe the cycling of water through Earth's systems driven by energy from the sun and the force of gravity.	ESS2.C
	MS-ESS3-3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.*	ESS3.C ETS1.A
HS	HS-ESS1-6. Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.	ESS1.C
	HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.	ESS1.B ESS2.A ESS2.D
	HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.	ESS2.C
	HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.*	ESS3.C ETS1.B

Table D-13. Disciplinary Core Idea Coverage for Earth and Space Sciences Across Grades 5, 8, and HS

	<i>Earth and Spaces Sciences Disciplinary Core Idea (DCI) Coverage Across Grades</i>											
	ESS1.A	ESS1.B	ESS1.C	ESS2.A	ESS2.B	ESS2.C	ESS2.D	ESS2.E	ESS3.A	ESS3.B	ESS3.C	ESS3.D
Grade 5		X		X			X				X	
Grade 8	X	X		X		X					X	
Grade HS		X	X	X		X	X				X	

The selected PEs within and across grades represent a content progression supporting essential learning and understandings in the Earth and Space Sciences. Fundamentals about Earth and the solar system lead to studying the history of planet Earth; understanding of Earth materials and systems anchors constructs in weather and climate as well as the role of water across the grades; and an emphasis on human impacts on Earth systems in all grade bands can allow for incorporation of natural resource and global climate considerations (ESS3.A, ESS3.D). DCI ESS3.B (Natural Hazards) was purposely excluded due to sensitivity concerns for this population of students.

NGSS Performance Expectation 5-PS2-1							
5-PS2-1 Support an argument that the gravitational force exerted by Earth on objects is directed down. [Clarification Statement: “Down” is a local description of the direction that points toward the center of the spherical Earth.] [Assessment Boundary: Assessment does not include mathematical representation of gravitational force.]

1. The first box displays the general education **PE** from which the EPEs are extended. The general education PE code and text, any clarification statements and assessment boundaries, and the three dimensions of the general education PE are provided.
2. The second box displays the **EPEs at Levels 1, 2, and 3**. The coding and text of each level is presented in progression at the top of the box.
3. Information about the alignment of the **dimensions** is provided below the EPE progression. For each dimension, the **Target** alignment is identified. These target dimension alignments reflect the specific SEP, DCI, and CCC incorporated in the Level 3 EPE and the general education PE, and further detail the type of knowledge, skills, and abilities that students will need to apply in an integrated way to demonstrate proficiency with the Level 3 EPE. Additionally, **Supporting** alignments may be identified for one or more of the dimensions. These supporting alignments list additional SEPs or CCCs that may be incorporated at the Level 1 and/or Level 2 access points to scaffold student learning towards Level 3 proficiency.

APPENDIX—E
VARIABLE FEATURES AND SUPPORTS

Target Volume of Information (VI)

The amount of information to be contained in the stimulus/scenario for an item is detailed in the specifications as “Target Volume of Information.” The chart below provides the key to the 1-4 coding presented in the specifications.

	1	2	3	4
Volume of Information (VI)	<p>No Scenario Presented:</p> <ul style="list-style-type: none"> 1 simple sentence stating stimulus, “This is a” or “The picture shows” (when applicable) Little to no additional info or instruction beyond standard item template language Minimal response options (no complete sentences or equations) No passage <p><i>Which picture shows an animal and its baby?</i> (no stimulus, 3 pictures)</p>	<p>Limited Scenario Presented:</p> <ul style="list-style-type: none"> 1 sentence describing stimulus or scenario Minimal information provided in 1 simple format (graph, diagram, organizer, formula) May have no scenario, but response options may be complete sentences or equations <p><i>Jose makes a model to show part of the water cycle.</i> [model graphic] <i>What is one path of the water as it moves through the water cycle in the model?</i> (1 information sentence and model in stimulus, 3 sentences)</p>	<p>Moderate Scenario Presented:</p> <ul style="list-style-type: none"> 2 sentences describing stimulus or scenario Moderate information provided in 1 format (graph, data table, diagram, organizer, formula) <p><i>John is studying how Earth is warmed by the Sun. He made a model to show how the Sun’s energy warms the Earth.</i> [model graphic] <i>Based on the model, what is one pathway for energy flow between Earth systems?</i> (2 information sentences and model in stimulus, 3 word card sequences)</p>	<p>Complex Scenario Presented:</p> <ul style="list-style-type: none"> 3 or more sentences describing stimulus or scenario Extensive information provided in 1 or more formats (graph, data table, diagram, chart, organizer, formula) <p><i>Melissa uses a model that shows the energy transfers that occur in a roller coaster. The information that Melissa records is shown in the data table. Melissa claims that the kinetic energy of the roller coaster changes as it moves along the track.</i> [data table] <i>Which data supports Melissa’s claim?</i> (multiple information sentences and data table in stimulus, 3 sentences)</p>

Note that Level 1 items may or may not contain a stimulus. Level 2 and Level 3 items will almost always contain a stimulus. The volume of information being targeted in the stimulus will be dependent on the specific language and expectation of the EPE access point, as reflected in the specifications for the EPE.

In all cases, attend to universal design principles, using short, clear sentences and simple pictures/tables/graphics.

Contexts

Almost all items should present a specific context for the questions. Contexts may vary from being very simple, familiar, and “local” to being more complex, less familiar in content and setting, and sometimes even abstract. The chart below provides the key to the 1-4 coding presented in the specifications.

	1	2	3	4
Context (C)	<p>Familiar Context & Immediate Setting (home and school)</p> <p>Contexts: schedule, lunch, recess, counting objects, weather, basic body parts, gravity on everyday objects, measuring height of everyday objects, family *Alternatively, no context provided</p> <p>Settings: home, classroom, media center, kitchen</p>	<p>Familiar Context & Immediate Setting (community)</p> <p>Contexts: volunteering, familiar animals/facts, more complex procedures (e.g., measuring weight before and after mixing or heating)</p> <p>Settings: town library/museum, grocery store, local parks and streams, well known environments (forest, farm, desert)</p>	<p>Unfamiliar Context & Extended Setting (global community)</p> <p>Contexts: animals, life cycles, respiratory system, internal functions of organs,</p> <p>Settings: Olympics, national parks and wildlife refuges, large rivers, oceans, clouds, volcanoes</p>	<p>Unfamiliar & Abstract Context (require student to apply knowledge)</p> <p>Contexts: carbon cycle, gene inheritance, glucose production in photosynthesis, gravity in space, changes in Earth’s position relative to Sun, periodic table, particles, molecules, model systems (stream tables)</p>

The item specifications also provide sample context to illustrate the types of contexts and scenarios that could work well with each particular access point. The contexts of actual items will vary beyond those shown in the sample items.

Target Vocabulary

Vocabulary used in alternate assessment items must be chosen carefully. The item specifications for each EPE contain suggestion for allowable and not-allowable vocabulary specifically related to the access points. As vocabulary may vary item by item based on the specific context and focus of the item, the specifications also contain a more generalized target for the level of vocabulary to be used in items at each level of the EPE. The chart below provided the key to the 1-4 coding present in the specifications.

	1	2	3	4
Vocabulary (V)	Familiar Vocabulary Presented: <ul style="list-style-type: none"> • Everyday words and single digit numbers (e.g., round shape, “which is a boy?”, “which is wet?” presented in item) • Examples of basic content words include food, rain, Sun, hot, push, pull 	Somewhat Familiar Vocabulary Presented: <ul style="list-style-type: none"> • Everyday words and basic content words used • Basic content words are words with science meaning that are used in conversation • Examples of basic content words include units of measure, data tables, graphs, decimals, light, time, gravity, electricity, energy, pattern 	Familiar & Unfamiliar Vocabulary Presented: <ul style="list-style-type: none"> • Mix of everyday words and unfamiliar words • More specialized content words used • Examples of more specialized content words include laboratory tools, predict, effect, resource, density, precipitation, evaporation, population 	Abstract & Unfamiliar Vocabulary Presented: <ul style="list-style-type: none"> • Abstract and/or complex content words introduced • Examples of abstract and/or complex content words include evidence, claim, carbon cycle, chlorophyll, carbon dioxide, atom, respiration

**Note that as grade level increases, familiarity with words may also increase. Therefore, a word that is unfamiliar at grade 5 may be familiar at grade 8 or HS.*

In all cases, attend to universal design principles, using the most familiar and basic vocabulary possible without sacrificing content accuracy; using consistent vocabulary through an item’s stimulus text, graphic, stem, and options; and clearly defining unfamiliar words when it is necessary to include them.

APPENDIX—F
TEST DESIGN BLUEPRINTS

NGSS-Alt Blueprints by Grade

ELEMENTARY				
PE	Text	DCI	SEP	CCC
5-PS1-2	Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.	1.A, 1.B	Using Mathematics and Computational Thinking	Scale, Prop, Quantity
3-PS2-2	Make observations and/or measurements of an object's motion to provide evidence that a pattern can be used to predict future motion.	2.A	Planning and Carrying Out Investigations	Patterns

3-LS4-1	Analyze and interpret data from fossils to provide evidence of the organisms and environments in which they lived long ago.	4.A	Analyzing and Interpreting Data	Scale, Prop, Quantity
5-ESS1-2	Represent data in graphical displays to reveal patterns of daily changes in the length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.	1.B	Analyzing and Interpreting Data	Patterns
3-ESS2-1	Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.	2.D	Analyzing and Interpreting Data	Patterns
5-ESS2-1	Develop a model using an example to describe ways in which the geosphere, biosphere, hydrosphere, and/or atmosphere interact.	2.A	Developing and Using Models	Systems and System Models
5-ESS3-1	Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.	3.C	Obtaining, Evaluating, and Communicating Information	Systems and System Models

*PEs marked with an asterisk incorporate Engineering constructs.

¹This PE crosses Physical Sciences and Life Sciences. It will be classified in Life Sciences in fulfilling the blueprint distribution.

MIDDLE				
PE	Text	DCI	SEP	CCC
MS-PS1-2	Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred.	1.A, 1.B	Analyzing and Interpreting Data	Patterns
MS-PS2-2	Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.	2.A	Planning and Carrying Out Investigations	Stability and Change
MS-PS3-5	Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.	3.B	Engaging in Argument From Evidence	Energy and Matter
MS-PS4-2	Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.	4.A, 4.B	Developing and Using Models	Structure and Function
MS-LS1-3	Use argument supported by evidence for how the body is a system of interacting sub-systems composed of groups of cells.	1.A	Engaging in Argument from Evidence	Systems and System Models
MS-LS1-5	Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms.	1.B	Constructing Explanations, Designing Solutions	Cause and Effect
MS-LS2-1	Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.	2.A	Analyzing and Interpreting Data	Cause and Effect
MS-LS2-3	Develop a model to describe the cycling of matter and flow of energy among living and non-living parts of an ecosystem.	2.B	Developing and Using Models	Energy and Matter
MS-ESS1-1	Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.	1.A, 1.B	Developing and Using Models	Patterns
MS-ESS2-2	Construct an explanation based on evidence for how geoscience processes have changed Earth's surface at varying time and spatial scales.	2.A, 2.C	Constructing Explanations, Designing Solutions	Scale, Prop, Quantity
MS-ESS2-4	Develop a model to describe the cycling of water through Earth's systems driven by energy from the sun and the force of gravity.	2.C	Developing and Using Models	Energy and Matter
MS-ESS3-3	Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.*	3.C (ETS1.A)	Constructing Explanations, Designing Solutions	Cause and Effect

*PEs marked with an asterisk incorporate Engineering constructs.

HIGH SCHOOL (INTEGRATED)

PE	Text	DCI	SEP	CCC
HS-PS1-2	Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.	1.A, 1.B	Constructing Explanations, Designing Solutions	Patterns
HS-PS2-3	Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.*	2.A ETS1.A, ETS1.C	Constructing Explanations, Designing Solutions	Cause and Effect
HS-PS2-5	Plan and conduct an investigation to provide evidence that an electrical current can produce a magnetic field and that a changing magnetic field can produce an electrical current.	2.B, (3.A)	Planning and Carrying Out Investigations	Cause and Effect
HS-PS3-2	Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative positions of particles (objects).	3.A	Developing and Using Models	Energy and Matter
HS-LS2-2	Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.	2.A	Using Mathematics and Computational Thinking	Scale, Prop, Quantity
HS-LS3-1	Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.	3.A, (1.A)	Asking Questions	Cause and Effect
HS-LS4-1	Communicate scientific information that common ancestry and biological evolution are supported by multiple lines of empirical evidence.	4.A	Obtaining, Evaluating, and Communicating Information	Patterns
HS-LS4-3	Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait.	4.B, 4.C	Analyzing and Interpreting Data	Patterns
HS-ESS1-6	Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.	1.C	Constructing Explanations, Designing Solutions	Stability and Change
HS-ESS2-4	Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.	1.B, 2.A, 2.D	Developing and Using Models	Cause and Effect
HS-ESS2-5	Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.	2.C	Planning and Carrying Out Investigations	Structure and Function
HS-ESS3-4	Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.*	3.C ETS1.B	Constructing Explanations, Designing Solutions	Stability and Change

*PEs marked with an asterisk incorporate Engineering constructs.

Overview

This document describes the Reporting Services administration analysis and reporting requirements for the Multi-State Alternate Assessment (MSAA) administered during the **2021-2022** academic school year. For each Reporting Services responsibility, information needed to produce accurate and timely deliverables is included throughout this document.

Partners

MSAA is a consortium of Partners. Each Partner may select various analysis and reporting deliverable options. The active Partner for the current school year is included in the table below.

Partner	Partner Abbreviation
American Samoa	AS
Arizona	AZ
Bureau of Indian Education (BIE)	BI
District of Columbia	DC
Department of Defense Education Activity (DoDEA)	DD
Guam	GU
Maine	ME
Commonwealth of Northern Mariana Islands (CNMI)	MP
Montana	MT
South Dakota	SD
Tennessee	TN
US Virgin Islands	VI

Assessment and Administrations

The MSAA contract consists of ELA and Mathematics assessments administered during the school year to grades 03-08, and 11. As a Partner option, Science may also be administered during the school year to grades 05, 08, and 11 students. Breakthrough’s system will be used for registration and administration of the assessments. Student test data will be collected online only; there will be no scannable documents.

Assessment Content Area	Assessment Grade	Brief Description	Start Date	End Date	Partner
English Language Arts	03	Stage-Adaptive test that includes operational and embedded field test items consisting of Single Select Choice Items and Writing Prompt item types	3/14/2022	04/29/2022	All
	04

Reporting Services Deliverables List

Reporting Services will produce various data file and static report deliverables included in the table below. This document details the data preparation, processing, and formatting rules.

Post-Test Administration Deliverable		Partners
Student Demographics Datafile (for Test Clean-Up)		All
Organization Datafile (for Test Clean-Up)		All
Test Materials Download Count		All
Writing Score Off-Topic		All
Billable Records Datafile (True-Up File)		All
Scaled Score Lookup Datafiles		AZ
Student Results School, District, and State Datafiles	Preliminary (State Only)	All
	Final	All
Duplicate/Void State Student Test Datafiles	Final	All
Student Report	Online	All
	Print	TN, BI
	Print Ready PDFs	DC
School and District Roster Report	Online	All
School, District, and State Summary Report	Online	All
eMetric Data Interaction (DI)	Online	BI
Parental Rescore Request		SD

Change Log

Administration	Description
• 2020-2021	• Datafile deliverables will be in EXCEL format instead of CSV
• 2020-2021	• ELA/Math Student Roster will be created at the district level in addition to school
• 2020-2021	• Any Partner choosing the Student Report Print Option will receive two copies of the report
• 2020-2021	• When both/all tests for a student are not launched/started but are closed (due to TA/TC misadministration) will be reported as ESM. These tests were previously reported as DNT.
• 2020-2021	• Science will be administered to the Partners who select the science option • Science Participation file will be created after test clean-up
• 2020-2021	• Administration window extended from 04/30/2021 to 05/14/2021 • Note: SD admin ends 05/07/2021
• 2020-2021	• Student Demographic test clean-process modified by combining bull-pen and demographic process • Partners can provide information for Cognia to add, remove, merge student data to be included in analysis and reporting • Partners can provide information for Cognia to update demographics, test status, and reporting status (participation status) • The process is outlined in the requirements document MSAA 2122 Student Demographic Instructions.pdf • Final reporting status values will be calculated as part of the demographic clean-up process and detailed in the requirements document MSAA 2122 Student Demographic Instructions.pdf
• 2020-2021	• DC does not plan to administer MSAA in 2021
• 2020-2021	• Do not print the Scaled Score Low/High sentence on the student report for students with a reporting status of ESR
• 2020-2021	• WRP Reporting Status will stay in the student results file. However, the rules will be to submit a value if different from ELA reporting status and blank if the same. Change the valid values to remove those that would not apply (remove TES, ESR, ESM, INC, ELL, EXE, DNT, WDR, and NLE). • A few supports/accommodation fields were removed from the student results layout since they no longer exist
• 2021-2022	• Science will be operational. Two major rounds of reports and datafiles: Pre-Standard Setting and Post-Standard Setting. Pre-Standard Setting will include ELA/Math Results and Science Participation as outlined in this document. Post-Standard Setting will include ELA/Math/Science results for Partners who participated in the Science assessment. • DoDEA joined MSAA • BI will have eMetric Data Interaction Reporting • Science Student Report design • School and District Student Roster re-designed such that one subject is reported on a single page. • Print Ready Student Report PDFs for Partners who opted in • Student Results Layout for ELA/Math/Sci new – modeled off of ELA/Math layout • Added calculation rule for “Ethnic” using the individual Race/Ethnicity variables to create one Ethnic variable

Pre-Test Administration Data Preparation

Organizational Data

Partners Cognia Operational Services department district and school data following a standardized layout. Cognia will load the data into an internal database referred to as ICORE. The requirements for district and school organizational handoff, load into ICORE, and data maintenance is out of scope for this document. However, the data will be used to support reporting assessment results. Internal use only school and district organizations are added to ICORE to support quality assurance. The fields and value descriptions used for MSAA reporting are detailed below.

MSAA Reporting Organizational Data Descriptions

Field	Field Description
ReportCode1	<ul style="list-style-type: none"> Partner Abbreviation Partner code DEMO are for internal use only
BT Org ID	<ul style="list-style-type: none"> Unique code assigned by the Breakthrough Portal to identify the Partners, Districts, and Schools
District Code	<ul style="list-style-type: none"> Unique code (within Partner) to identify districts District Code values of DEMOA and DEMOB are for internal use only Length and Pattern of Values Varies
District Name	<ul style="list-style-type: none"> District name used for reporting ASCII Text field Maximum allowable length 30
School Code	<ul style="list-style-type: none"> Unique code (within Partner) when combined with District Code identifies a unique School Schools associated with District Code values DEMOA and DEMOB are for internal use only Length Varies and Pattern of Values
School Name	<ul style="list-style-type: none"> School Name used for reporting ASCII Text field Maximum allowable length 30

MSAA ICORE Data Store

ICORE contract code is used to identify the set of organizational data used to support analysis and reporting.

Administration	ICORE Contract Code	Partners
Spring 2022	<ul style="list-style-type: none"> 603150, 603000 	<ul style="list-style-type: none"> All

Test Meta Data

The information in this section describes the test meta data needed to support data student test data validation as well as analysis and reporting activities. Test meta data includes information about tests, forms, and items being administered. Test meta data impacting analysis and reporting include Test Form ID, Test Form Session & Position, Item Number, Item Type, Item Points, Item Subject, Count Towards Student Score, Item Role on Test Form, Equating Eligible Status.

Source

NTS is the primary test meta data source support MSAA analysis and reporting. Test meta data will be extracted from NTS after Content Development and Publications Cognia department (CDP) completes test clean up.

Session Forms

MSAA is designed to be stage adaptive. The student's score on the first session determines what form will be administered in the second session. Therefore, Forms will be constructed at the session level. Each eligible student is expected to take one form for session 1 and one form for session 2 for an assessment content area (also referred to as test). All forms will be available in English only. Note: Science is not Stage-Adaptive in 2021-2022.

Test Session & Position

Within the NTS data, for Stage-Adaptive tests, each form consists of one session where each session consists of a collection of items. The NTS form name includes the session. The position field indicates the order items are presented to students. Position should be unique on a test form.

Special Processing of Form Meta Data

Session Form data will be used to create Test Form data by combining all possible combinations of Session 1 Form and Session 2 Forms.

Item Number

Item number (NTS AssetID) is used to support various psychometric analyses as well linking student test data to NTS data.

Item Types

Each item is characterized by its type. The item type identifies student response and score data formats. The table below lists the item types administered by MSAA. MSAA tests consist of single select choice items and a writing prompt (ELA only). Writing prompts are scored on three trait dimensions: Organization, Idea Development, and Conventions.

Item Type Label	NTS Identification	Reporting Abbreviation	CDP Abbreviation
Single-Select Choice	Interaction Type: choiceInteraction, and Correct Response: Exactly one option is the correct response	MC	SR
Writing Prompt: Scored on Three Dimensions/Traits	PointValue = 9 (Note: Each Dimension scored on 3 points)	WP	WP

Item Role on Test Form

Each item on a form is characterized as operational or field test. An item's role on a test form impacts various analyses including calculating student test scores.

Role	Abbreviation	Rule
Operational	OP	<ul style="list-style-type: none"> Included in calculating student test scores CountsTowardStudentScore = Yes
Field Test	FT	<ul style="list-style-type: none"> Excluded from calculating student test scores CountsTowardStudentScore = No

Stage-Adaptive Requirements

Reporting provides Psychometrics session 1 scaling items item lists. Psychometrics provides the routing lookups to Cognia CDP department to be incorporated in test production. Psychometrics determines the raw scores for each session 1 form required for session 2 form assignment. Since Science is not stage-adaptive in 2021-2022, routing item lists will not be produced.

ELA Reading and Writing Items

Every ELA item is assigned a Subject value of Reading or Writing in NTS. The Subject code is used for calculating Reading Percent of Points Earned and Writing Percent of Points Earned.

Test Administration Validation

Reporting participates in validating Breakthrough MSAA Testing System prior to the system going live for an administration.

Student Registration Data

Student registration occurs with each Partner utilizing the Breakthrough MSAA Systems Portal. Registration requirements are outside the scope of this document. Each student will be associated to a Partner, district within the Partner, and school within the Partner in the portal.

Post-Test Administration Data Clean-up

Report Services receives data from various sources, validates the data, and applies processing rules to prepare data for psychometrics, analysis, and report generation. This section provides a general overview of the various sources and a detailed description of student item responses and scores as well as test status. In-depth detail on the data processing rules and data sources are out of scope of this document.

Student Data Sources

Student Online Test Data – BT Systems Portal	
Description	<ul style="list-style-type: none"> • Breakthrough will provide Cognia data related to student online testing following and agreed upon schedule. • The data includes <ul style="list-style-type: none"> ○ student demographics at the time of testing, ○ student accommodation, ○ LCI data, ○ student response check data, ○ student test data including not tested reasons, student test session data, test date time stamp, student item responses item evidence, and scores, ○ test meta data ○ test proctor data, ○ organization data
General Rules	<ul style="list-style-type: none"> • Cognia Reporting will import and validate the files • Cognia Reporting will provide item evidence counts to Cognia Client Services for conformation that all evidence files have been received for scoring
File Layout	<ul style="list-style-type: none"> • BT provides Cognia standard CSV files following an agreed upon format

Demographic File – Partner Updated	
Description	<ul style="list-style-type: none"> • Partners provide an updated student demographic data file • Cognia will incorporate updates as part of post-test administration student test cleanup
General Rules	<ul style="list-style-type: none"> • Refer to MSAA 2122 Student Demographic Instructions.pdf
File Layout	<ul style="list-style-type: none"> • Refer to MSAA 2122 Student Demographic Instructions.pdf

Student Human Item Scores	
Description	<ul style="list-style-type: none"> Cognia Scoring Services will provide Reporting Services student level item scores and non-scorable scores
General Rules	<ul style="list-style-type: none"> Refer to section “Student Item Response: Human Score Type “
File Layout	<ul style="list-style-type: none"> Scoring Specifications

Student Item Data

The purpose of this section is to describe in detail the data associated with items on student tests necessary for analysis and reporting and student data clean-up activities.

Student Item Response: Format

Student item responses are captured and formatted and stored as described below. Item type is used to categorize the response formats.

Item Type	Student Response Description	Sample Value
Single-Select Choice	<ul style="list-style-type: none"> Single alpha character 	<ul style="list-style-type: none"> A
Writing Prompt	<ul style="list-style-type: none"> N/A 	<ul style="list-style-type: none"> N/A

Student Item Response: Scoring Method

Each student response to an item is assigned a score value. An item score is assigned either by machine scored or human scored. Student responses collected online is either machine scored by the testing platform or human scored.

Item Type	CBT	PBT	Scoring
Single-Select Choice	Testing Platform	N/A	Exact Match: 1 = student response match correct response; 0 otherwise
Writing Prompt	Human	N/A	Refer to sections Student Item Response: Human Score Type, Writing Prompt: Valid Dimension Score Combinations and Writing Prompt: Score Adjustment sections below

Item Excluded: Identify Student Modified Test Form

Rarely an administration issue may lead to excluding an item from a student test form during test clean-up. To exclude the item from scoring a particular student’s test, the item response is set to X and score set to blank. Student test scores will be based on all core items administered the student where the response is not X.

Writing Prompt: Raw Trait Dimension Scores

Student responses requiring a human score will have a final score of record, scorer 1 score, scorer 2, and scorer 3 score as defined by scoring procedures. The final score of record value is used to calculate official student test scores and used to determine if a student attempted an item. Refer to the Writing Prompt: Score Adjustment section for more information on the writing prompt score. Scoring rubrics and procedures are out of scope for this

document. Each student response requiring a human score will be assigned a final score of record score value for each rubric dimension as outlined in the table below.

Human Score	Interpretation	Raw iScore Value	Valid*	Item Attempt**
Numeric	Valid numeric score (an integer greater than or equal to 0 and less than or equal maximum allowed item score as defined in the rubric)	0,1,2,3	OP, FT	Yes
Blank	No deliberate marks in the answer space; No evidence submitted	B	OP, FT	No
Unreadable	Faint handwriting or otherwise obstructed student response	U	FT	Yes
Non-English	Response is written in a language other than English, or is a mix of English and another language but lacks sufficient English to provide a score	F	OP, FT	Yes
Off Topic	A response that is not related to the task/prompt administered or is not a valid attempt at answering any task/prompt on the test	5	OP, FT	Yes
Repeats the Prompt	The response copies the prompt or portions of it and offers no attempt to respond to the task/prompt	P	OP, FT	Yes
No Score	Any other response that cannot receive a numeric score	N	OP, FT	Yes
Insufficient Amount to Score	The response contains an insufficient amount of writing to score	A	N/A	Yes
Refusal	The response clearly indicates a refusal on the part of the student to address the prompt or participate in the test	R	N/A	Yes
Illegible	Tiny or poor handwriting, spelling that cannot be deciphered, or other conditions that render the student work indecipherable	I	N/A	Yes
Wrong Location	Item response inconsistent with student form	W	N/A	Yes
Response Not Scored	Field test item where students' response was not selected for scoring	# or blank	FT	Unknown

(*) Valid: OP = Human score value is valid for operational items

FT = Human score value is valid for field test items

N/A = Not applicable for project. If value provided, resolution needed.

Note: In 2021-2022, all Writing Prompts are OP.

(**) Item Attempt: Yes = Human score value indicates student attempted the item

No = Human score value indicates student did not attempt the item

Unknown = Not enough information to determine if the student attempted the item

Writing Prompt: Valid Trait Dimension Score Combinations

Writing prompts are scored on three trait dimensions: Organization, Idea Development, and Conventions. Each trait is assigned a score listed in the "Raw Score Value" column in "Writing Prompt: Raw Trait Dimension Scores". Off Topic is not a valid score for the Conventions trait. If one dimension score is scored a B, then all dimension scores must be a B.

Writing Prompt: Dimension Score Adjustment

The raw iScore dimension score values are translated as indicated below to support analysis and reporting requirements. During test cleanup, the raw iScore value is translated to the Student Results value except Z will be set to B to be consistent with standard processes. “B” will be translated to “Z” when producing the student results and void/duplicate files

Human Score	Raw iScore Value	Psychometric Score Value	Student Results
Rubric Score	0	0	0
Rubric Score	1	1	1
Rubric Score	2	1	1
Rubric Score	3	2	2
Blank	B	0	Z
Unreadable	U		U
Non-English	F	0	F
Off Topic	5	0	O
Repeats the Prompt	P	0	P
No Score	N	0	N
Item Excluded: Identify Student Modified Test Form during Clean Up	0-3,5, B, U, F, P, N		X

Single-Select Choice Response: Response Adjustment

Student responses to single-select choice items are translated below to support analysis and reporting.

Raw Response	Raw Value	Psychometric Score Value	Student Results
Raw Response	A, B, C, or D	0 = response does not match item key 1 = response matches item key	A, B, C or D +
Raw Response	blank	0	Z
Item Excluded: Identify Student Modified Test Form during Clean Up	A, B, C, D, or blank		X

Student Item Attempt

Item Type	Item Attempt Rule
Single-Select Choice	If student raw response is not blank or X, the student attempted the item
Writing Prompt	If the student’s earned score value for one or more dimensions is listed as a “Yes” in “Item Attempt” column in “Writing Prompt: Raw Trait Dimension Scores” table, the student attempted the item.

Student Test Data

Test data applies at the ELA, Mathematics, and Science levels. Science test data will only exist for Partners who selected the option to administer the science test. The purpose of this section is to describe in detail the data associated with student tests necessary for analysis and reporting and student data Clean-Up activities

Student Test Status

Each student test is assigned a test status in the Breakthrough Portal and adjusted during student data Clean-Up when necessary. This field will be updated during demographic clean-up.

Final Test Status	Condition
InProgress	<ul style="list-style-type: none"> BT Portal value Paused value is changed to InProgress during test Clean-Up Provided by field using BT Portal
Cancelled	<ul style="list-style-type: none"> Provided by field using BT Portal Canceled test status is also referred to as Closed Tests
Completed	<ul style="list-style-type: none"> Provided by field using BT Portal Completed test status value is also referred to as Submitted
[Blank]	<ul style="list-style-type: none"> Final Test Status will be blank for Science if a Partner does not participate in Science Final Test Status will be blank for students who were added during demographic clean up

Student Reporting Status (Participation Status)

Each student is assigned an ELA Reporting Status, Mathematics Reporting Status, a Writing Reporting Status, and Science Reporting Status during test cleanup. The allowed values are detailed in the table below. If a partner does not participate in Science, the Science Reporting Status will be blank. The rules for assigning the final reporting status are out of scope of this document. Refer to student demographic clean-up instructions for reporting status assignment rules.

Test Reporting Status	Code	Description
Administration Irregularity	IRR	Administration irregularity reported, but does not necessitate an invalidation
Invalidated	INV	Student-based or administration-based irregularity resulting in invalidation
Parental Refusal	PRF	Parental refusal
ELL Exempt (ELA Only)	ELL	Student meets the ELA ELL 1 st Year in U.S. exemption requirements
Exempt	EXE	Student meets test exemption requirements
Withdrew	WDR	Student withdrew
No Longer Eligible	NLE	Student is no longer eligible for testing
Tested	TES	Submitted test, regardless of number of item responses
Tested-Incomplete	INC	In-Progress Test, with at least one item response
Early Stopping Rule	ESR	Closed Test – with no item response
Early Stopping Rule – Misadministration	ESM	Closed Test – with at least one item response Closed Test – both/all content area tests not launched or started
Did Not Test	DNT	No Test, or In-Progress Test with no item response

Post-Test Administration Student Data Clean-Up

Various data sources, including Test Meta Data, Organization Data, Online Student Test Data, Scores for Human scored items, and Demographic Clean-Up are used to conduct student data clean-up to produce student test data ready for analysis and reporting. The table below describes relevant detail related to the clean-up process and requirements.

Data	Guidelines
General Information	<ul style="list-style-type: none"> • Cognia will update student data using the updated demographic files returned by each Partner as outlined in the Demographic Clean-Up Instructions for additional details • Updates include modifying demographic, test status, preliminary reporting (participation status), item responses/scores data as well as adding and removing student tests • After the updates are incorporated, Cognia will perform additional clean up as outlined below
Organization Data	<ul style="list-style-type: none"> • All student test records associated with the same student ID must have the same School, District, and State • State, District, and School codes associated with student tests must exist in ICORE and Breakthrough Organization file. • New or revised Organization data will be updated in both ICORE and Breakthrough reporting platforms • Cognia will work with Partners to identify the complete set of schools and district organizations, along with the names for reporting, during the demographic file acceptance and organization Clean-Up process with each Partner
Student Test Grade	<ul style="list-style-type: none"> • Test grade is expected to match Student Enrolled Grade. • If a student's enrolled grade level is provided in the final demographic data does not match the student's tested grade, the test is considered off-grade and will be marked as "Void/Duplicate"
Duplicate Test	<ul style="list-style-type: none"> • After Off-Grade tests have been resolved, duplicate tests are tests in the same Assessed Content Area and State Student ID within a State Partner • The final test used for analysis and reporting is determined used the following hierarchy <ul style="list-style-type: none"> ○ Submitted/Completed ○ Closed ○ In Progress ○ If two or more tests have the same status, the test associated with the latest date will be used, determined by the datetime stamp of the test record. Additionally, the larger TestID is used if still duplicate. • The duplicate test(s) not selected for analysis and reporting will marked as "Void/Duplicate"
Student Test Status	<ul style="list-style-type: none"> • Final ELA, Math, and Science Test Status will be audited based on MSAA 2122 Student Demographic Instructions.pdf
Student Test Reporting Status	<ul style="list-style-type: none"> • Final ELA, Math, and Science Test Reporting Status (Participation Status) will be calculated based on MSAA 2122 Student Demographic Instructions.pdf
Student Writing Prompt Reporting Status	<ul style="list-style-type: none"> • Final Writing Prompt Reporting Status (Participation Status) will be calculated based on MSAA 2122 Student Demographic Instructions.pdf

Data	Guidelines
Student Test Item Responses	<ul style="list-style-type: none"> Item responses could be removed based on Student Test Reporting Status as detailed in the demographic clean up instructions
Ethnic	<ul style="list-style-type: none"> For DIF and eMetric DI the algorithm below is applied to assign one Ethnic value as follows: <ul style="list-style-type: none"> If Hispanic is indicated, then “Hispanic” Else, if DemographicRaceTwoOrMoreRaces is indicated then “Multi” Else if AmericanIndianOrAlaskaNative is indicated then “AIAN” Else if Asian is indicated then “Asian” Else if BlackorAfricanAmerican is indicated, then “BAA” Else if NativeHawaiianOthPacificIslander is indicated, then “NHOPI”, Else if White is indicated, then “White”

Post-Test Administration Psychometric Data

Reporting Services will provide Cognia Psychometric team test meta data and student test administration data consisting of demographics, student test status, student test form, and student item level responses and scores. Psychometrics will conduct statistical key checks, Stringer Analyses, CTT, and IRT. The specifications for such activities are out of scope for this document. Psychometrics will provide Reporting Services pre-equated test scaling information and raw score to scaled score lookup tables as described in this section to support creation of data file and report deliverables.

Psychometrics Assigned Scores	
ELA Cut Scores by Test Grade	<ul style="list-style-type: none"> Proficiency Level Scale Score Ranges
ELA Scaled Score Lookup by Test Grade	<ul style="list-style-type: none"> Scale form Raw Score Scale Score Proficiency Level Scale Score Low/High
Math Cut Scores by Test Grade	<ul style="list-style-type: none"> Proficiency Level Scale Score Ranges
Math Scaled Score Lookup by Test Grade	<ul style="list-style-type: none"> Scale form Raw Score Scale Score Proficiency Level Scale Score Low/High
Science Cut Scores by Test Grade	<ul style="list-style-type: none"> Proficiency Level Scale Score Ranges Available after Science Standard Setting 2021-22
Science Scaled Score Lookup by Test Grade	<ul style="list-style-type: none"> Scale form Raw Score Scale Score Proficiency Level Available after Science Standard Setting 2021-22

Post-Test Administration Reporting Calculations

This section details calculations and formatting applied after test clean-up is complete.

Student Data

The data listed below details student level data used to support various analysis and reporting tasks. It does not include a complete list of student data fields available. Student data prepared for psychometrics is merged with student scores calculated by psychometrics. [Test] Refers to ELA, Math, and Science tests. Science test fields will be blank for Partners who did not participate in Science.

Field	Description
[Test] Form	<ul style="list-style-type: none"> Two letter test form identification where the first letter identifies the session1 form and the second letter identifies the session 2 form Students without a test form who need to be reported are defaulted to form AA or 01
[Test] Scale Form	<ul style="list-style-type: none"> Identifies the unique set of scaling and equating items based on Test Form and "Item Excluded: Identify Student Modified Test Form during Clean Up"
[Test] Form Modified	<ul style="list-style-type: none"> If during test clean up the student test was identified as "Item Excluded: Identify Student Modified Test Form during Clean Up" the field will be set to a "1"; otherwise it will be "0"
[Test] Raw Score	<ul style="list-style-type: none"> Sum of final non-flawed item scores classified as "counts toward student score" items for the student test
[Test] Scaled Score	<ul style="list-style-type: none"> Using calculated Test Scale Form, Test Raw Score and Psychometric Raw Score to scale score lookup, assign a Test Scaled Score Apply Reporting Status test score rules as appropriate for a specific deliverable
[Test] Performance Level	<ul style="list-style-type: none"> Using calculated Test Scale Form, Test Raw Score and Psychometric Raw Score to scale score lookup, assign a Test Performance Level Apply Reporting Status test score rules as appropriate for a specific deliverable
[Test] Scaled Score Low/High	<ul style="list-style-type: none"> Using calculated Test Scale Form, Test Raw Score and Psychometric Raw Score to scale score lookup, assign a Test Scaled Score Low/High Apply Reporting Status test score rules as appropriate for a specific deliverable
[Test] State Compare	<ul style="list-style-type: none"> Calculate by comparing the student's [test] scaled score with the state average scaled score and the student's scaled score SEM <ul style="list-style-type: none"> Below (-): $\text{state average scaled score} - \text{student's scaled score SEM} > \text{student's scaled Score}$ At (=): $\text{state average scaled score} - \text{student's scaled score SEM} \leq \text{student's scaled Score} \leq \text{state average scaled score} + \text{student's scaled score SEM}$ Above (+): $\text{student's scaled Score} > \text{state average scaled score} + \text{student's scaled score SEM}$

continued

Field	Description
[Test] Item Score String	<ul style="list-style-type: none"> • Test Item Score/Response String • Apply Reporting Status test score rules formatting as appropriate for a specific deliverable • Each column in the string represents a core item (counts toward student score) • Selected Response: <ul style="list-style-type: none"> ○ + = Correct Response ○ A, B, C, D = Incorrect Response ○ Z = No Response ○ X = Item Excluded from Student's form • Writing Prompt: <ul style="list-style-type: none"> ○ 0,1,2 = Response Score ○ Z (blank), F (Foreign Language), P (Copy of Prompt), N (No Score), O (Off Topic) Non-Scorable Codes ○ X = Item Excluded from Student's form
[Test] Field Item	<ul style="list-style-type: none"> • If at least one field test item is attempted on the test, then "1", otherwise "0"
ELA Reading Percent of Points Earned	<ul style="list-style-type: none"> • Percentage of possible points correct for reading items • Values: 0-100, N/A • Apply Reporting Status test score formatting rules as appropriate for a specific deliverable • Include all core items administered to the student
ELA Writing Percent of Points Earned	<ul style="list-style-type: none"> • Percentage of possible points correct for writing items • Values: 0-100, N/A • Apply Reporting Status test score rules as appropriate for a specific deliverable • Include all core items administered to the student
WR Trait Scores	<ul style="list-style-type: none"> • Student level writing trait scores are included part of overall ELA test • Apply Reporting Status test score formatting rules as appropriate for a specific deliverable • Refer to Writing Prompt: Dimension SFcore Adjustment table Student results column <ul style="list-style-type: none"> ○ 0,1,2 = Response Score ○ Z (blank), F (Foreign Language), P (Copy of Prompt), N (No Score), O (Off Topic) Non-Scorable Codes

Aggregate Data

Aggregation Level

Each student is assigned one State, District, and School code to use for aggregations as described in the table below

Aggregation Organizational Level	Aggregation Code
State	Partner Abbreviation
District	Combined Partner Abbreviation and District Code
School	Combined Partner Abbreviation, District and School Code

Aggregation Formulas

The aggregations below are calculated to support various datafiles and reports. The calculations are aggregated by state, school, and district. *Student tests identified as Void/Duplicate or Remove are excluded from all aggregations.*

Aggregation	Calculation
Number Enrolled	<ul style="list-style-type: none"> Number of student tests that have at least one test assigned one of the final reporting status values other than WDE or NLE for the aggregation level
Number Tested	<ul style="list-style-type: none"> Number of student tests assigned TES, ESR, or IRR final reporting status for the aggregation level
Number of Did Not Test	<ul style="list-style-type: none"> Number of student tests assigned ESM, INC, INV, PRF, ELL, EXE, DNT, WDR, NLE final reporting status for the aggregation level
Average Scale Score	<ul style="list-style-type: none"> Average test scale score for students included in the “Number Tested” aggregation rounded to the nearest whole number for the aggregation level
Number of Students at each Performance Level	<ul style="list-style-type: none"> Number of student tests included in the “Number Tested” count with the specific Performance Level Value for the aggregation level
Percent of Students at each Performance Level	<ul style="list-style-type: none"> Divide the “Number of Students at each Performance Level” by the Number Tested for the aggregation level. Multiply by 100 and round to the nearest whole number.

Aggregation Suppression Rule

Aggregations with less than 10 students included in the denominator will be suppressed from state level reports only

Post-Test Administration Data File Deliverables

Student Demographics Datafile (for Test Clean-up)

Description	<ul style="list-style-type: none"> Cognia provides each participating Partner an excel file containing raw student data to support data cleanup
Generation Rules	<ul style="list-style-type: none"> Refer to MSAA 2122 Student Demographic Instructions.pdf
File Layout	<ul style="list-style-type: none"> Refer to MSAA 2122 Student Demographic Instructions.pdf
File Name	<ul style="list-style-type: none"> Refer to MSAA 2122 Student Demographic Instructions.pdf

Organization Datafile (for Test Clean-up)

Description	<ul style="list-style-type: none"> Cognia provides each participating Partner an excel file containing organization data to support data cleanup
Generation Rules	<ul style="list-style-type: none"> ICORE organization data are used directly to create the file as detailed in the layout
File Layout	<ul style="list-style-type: none"> MSAA2122OrgDataLayout.xlsx
File Name	<ul style="list-style-type: none"> MSAA122_ICORE_[state abbreviation].xlsx

Test Materials Download Count Datafile

Description	<ul style="list-style-type: none"> Breakthrough provides test materials data table Cognia uses the data table to create a data file for each state containing the relevant state data
File Name	<ul style="list-style-type: none"> MSAA2122_tblFilddownloads_[state abbreviation].xlsx

Writing Score Off-Topic Datafile

Description	<ul style="list-style-type: none"> The writing off-topic datafile lists students and their writing prompt trait scores.
Generation Rules	<ul style="list-style-type: none"> Raw ISCORE scores are provided in the file except Off Topic is O and B, F, N are translated to 0
File Layout	<ul style="list-style-type: none"> State, DistrictCode, SchoolCode, DistrictName, SchoolName, Lname, Fname, StateStudentID, Grade, ItemNumber, Trait1score, Trait2Score, Trait3Score
File Name	<ul style="list-style-type: none"> WritingDelivareble-[state abbreviaton].xlsx

Billable Records Datafile

Description	<ul style="list-style-type: none"> MSAA States shall be billed out based on record results. Billable results shall be delivered to Cognia’s Finance Department for true up and final billing.
Generation Rules	<ul style="list-style-type: none"> Each tested student is considered a billable record <ul style="list-style-type: none"> Each student test shall be considered a valid billable record when a test is launched and In Progress, Closed or Submitted. A billable record does not include where a student does not have a test record, is no longer enrolled or is withdrawn Records with a blank nap_delivery_id will be highlighted The datafile will include two tabs: one for Reporting records (included in results datafile) and Not Reported Records (included in Duplicate/Void datafile) The records will be reported in the file with their SSID
File Name	<ul style="list-style-type: none"> Billing_[state abbreviation].xlsx

Scaled Score Lookup Datafile

Description	<ul style="list-style-type: none"> The rawscore to scaled score lookup will be created and provided as an option to Partners
Generation Rules	<ul style="list-style-type: none"> One EXCEL file for each Test Subject will be created containing the psychometric raw score to scale score lookup data Each EXCEL file will contain a worksheet for each test grade
File Layout	<ul style="list-style-type: none"> Each worksheet will contain columns: Grade, Subject, ScaleForm, RawScore, ScaledScore, LowScaledScore, HighScaledScore, and PerfLevel
File Name	<ul style="list-style-type: none"> MSAA2022ScaledScoreLookups_mat.xlsx MSAA2022ScaledScoreLookups_ela.xlsx MSAA2022ScaledScoreLookups_sci.xlsx

Student Results School, District, State Datafile

Description	<ul style="list-style-type: none"> The student results data file will contain all data for student tests not identified as Void/Duplicate during test Clean-Up as well as students’ tests added during test clean-up following the file layout State files will be produced and provided on the sFTP State, District, and School files will be provided to Breakthrough
Generation Rules	<ul style="list-style-type: none"> The student results data file is sliced by state, district, and school. Student tests are included in the specific version of the file based on the Aggregation Organization Level of State, District, and School assignment rules Refer to table “Final Report Status Formatting of Student Scores table” The file layout defines each field and valid values The file will be exported to EXCEL.

continued

File Layout	<ul style="list-style-type: none"> MSAA2122StudentResultsLayout.xlsx District and School files will contain a subset of variables as indicated in the layout “District, School Files” column For Partners not participating in Science: worksheet StuResults_ELAMat will be used to generate the files For Partners participating in Science: worksheet StuResults_ELAMATSCI will be used to generate the files For 21-22, the files will be generated as follows Pre-Standard Setting: All files posted to Breakthrough will follow the StuResultsELAMat layout. All files posted to the sFTP site for Partners who did not participate in Science will follow the StuResultsELAMat layout. All files posted to the sFTP site for Partners who did participate in Science, will follow the StuResults_ELAMATSCI, but Science scaled score and performance level data will be blank Post-Standard Setting: All files (BT and sFTP) for Partners who participated in Science will receive updated files following StuResults_ELAMATSCI layout.

(*) All Scores: State student results file includes item responses, WP trait scores, raw scores, scaled scores, and performance levels.

- Yes = Include score in data file; No = Leave column blank in data file; N/A = Put N/A in the data file

Duplicate/Void Student Datafile

Description	<ul style="list-style-type: none"> The file contains the student tests identified as Void/Duplicate, including Off-Grade test records during test Clean-Up process Data within the datafile shall be interpreted with caution since minimal Clean-Up has been applied
Generation Rules	<ul style="list-style-type: none"> The file will follow the same layout and rules as the ELA/Math student results file, except only include student tests identified as Void/Dup A file will be created for each Partner if there is at least one student test identified as Void/Dup The file will be exported to EXCEL.
File Layout	<ul style="list-style-type: none"> MSAA2122StudentResultsLayout.xlsx District and School files will contain a subset of variables as indicated in the layout “District, School Files” column For Partners not participating in Science: worksheet StuResults_ELAMat will be used to generate the files For Partners participating in Science: worksheet StuResults_ELAMATSCI will be used to generate the files
State File Name	<ul style="list-style-type: none"> 2022_[Partner abbreviation]_VoidDupResults.xlsx

Post-Test Administration Report Deliverables

Student Report

Report Delivery

- Students who have an ELA or Math final reporting status of TES, ESR, or IRR will receive an ELA/Math Student Report.
- **Students who have a Science final reporting status of TES, ESR, or IRR will receive a Science Student Report (Note: Science Student Report will be available after Standard Setting)**

Print

- Only Partners who selected the Print option will receive two printed copies of the student report
- A print report package will be created by school.
- Slip sheets will be created at the start of each new report pack. The slip sheet identifies the appropriate shipping information and provides a way to track the secure shipment.
- ELA/Math Student Reports will be printed and shipped.
- **Science Reports will be printed and shipped.**
- **Printed student reports will be gray-scaled.**

Print Ready

- **Only Partners who selected the Print Ready PDF option will receive print ready PDFs of the student report**
- **One or more PDFs will be created and sorted by testing district, testing school, test grade, student last name, student first name, student ID. Include Slip Sheets. CPI codes are not required.**
- **The number of PDFs created depends on the number of reports generated and will be minimized.**
- **ELA/Math Student Report Print Ready PDFs will be available as scheduled.**
- **Post-Standard setting, if Partners opted in for Print Ready and Science, Science Print Ready PDFs will be available.**
- **Print ready student reports will be gray-scaled.**

Online

- A PDF will be generated for each Partner and school containing all student reports for the school regardless of test grade.
- Student reports will be sorted by Test Grade, Student Last Name, Student First Name, Student ID
- **Prior to standard setting, the PDFs will only contain ELA/Math Student Reports. After Standard Setting, for Partners participating in Science, the online PDFs will be updated to add Science Student Reports at the end of each PDF. (Next year, the sort order can change)**
- **Online student reports will be in color.**

Data Visualization

This section details the data visualizations for the ELA/Math and Science Student Report. Each ELA/Math student report is a two-page report (front and back). The ELA/Math report is designed to display both ELA and Math results side by side. The Science student report is a two-page report (front and back) one-subject report. The front page of every student report is noted as “Confidential”.

- Print Student First name possessive, when appropriate. Throughout the student report, the student’s first name appears embedded in text, it will appear as is or modified to be possessive as follows
 - If student first name ends in ‘s’ append apostrophe to student first name
 - Otherwise, print [Student First Name]’s in section introduction sentence
- First Page Header
 - Name: [Student First Name] [Student Last Name]
 - ID: [State Student ID]
 - School: Print School Name
 - Test Date: Spring [Year] (example: Spring 2022)
 - Grade: [Two-Digit Test Grade]
- First Page Performance Summary

Format Performance Summary section based on the student’s final test reporting status as detailed in the table below.

Test Final Reporting Status	Test Result Section	Visualization
TES or IRR	Performance Level	<ul style="list-style-type: none"> • Print formatted earned student performance level <ul style="list-style-type: none"> ◦ Level 1 ◦ Level 2 ◦ Level 3 ◦ Level 4
	Score	<ul style="list-style-type: none"> • Print the student earned scaled score
	Score Graphic	<ul style="list-style-type: none"> • Place arrow in the relative location of the graphic for the student’s scaled score with score printed above the arrow • Print scaled score ranges in each performance level
	Score Low/High	<ul style="list-style-type: none"> • Print the student’s lower and upper scaled score
	R/W Percent of Points Earned (ELA Only)	<ul style="list-style-type: none"> • Print the student’s earned percent of points
ESR	Performance Level	<ul style="list-style-type: none"> • Print formatted student performance with an asterisk • Level 1*
	Score	<ul style="list-style-type: none"> • Print the student scaled score provided by psychometrics. It is expected to be 1200.
	Score Graphic	<ul style="list-style-type: none"> • Place arrow in the relative location of the graphic for the student’s scaled score with score printed above the arrow

Test Final Reporting Status	Test Result Section	Visualization
	Score Low/High	<ul style="list-style-type: none"> Print scaled score ranges in each performance level Leave blank. Do not print the Low/High Scaled Score sentence.
	R/W Percent of Points Earned (ELA Only)	<ul style="list-style-type: none"> Print N/A
All Other Values	Leave blank under the Test Subject header except print the note:	<ul style="list-style-type: none"> Your child did not receive a score in this content area. Please contact your child's teacher/school for more information.

- First Page Performance Level Descriptors

Format Performance Level Descriptors section based on the student's final test reporting status detailed in the table below.

Test Final Reporting Status	Visualization
TES or IRR	<ul style="list-style-type: none"> Print formatted performance level descriptors based on student test grade, test subject, and earned student performance level The performance level descriptors were provided to Reporting during report design after standard setting. The text is carried forward from year to year. Each statement starts with a checkmark
ESR	<ul style="list-style-type: none"> Print the text under the Test Header: * Your child did not show an observable response mode during the test; therefore, the test was not administered by the teacher. If you have additional questions, please contact your child's teacher.
Other	<ul style="list-style-type: none"> Leave section under Test header blank

- First Page Footer
 - Left Justified: Copyright information

School and District Roster Report

Report Delivery

Pre-Standard Setting:

- A School Roster Report will be produced when a school has at least one student assigned an ELA or Math reporting status value other than WDR or NLE.
- A District Roster Report will be produced when a district has at least one student assigned an ELA or Math reporting status value other than WDR or NLE.

Post-Standard Setting:

- A School Roster Report will be produced when a school has at least one student assigned an ELA, Math or Science reporting status value other than WDR or NLE.
- A District Roster Report will be produced when a district has at least one student assigned an ELA, Math or Science reporting status value other than WDR or NLE.
- Static PDFs will be generated to be posted online. The report is not printed.

Data Visualization

This section details the data visualizations for the School and District Roster Report.

- District Roster Report**
 - Header
 - Print: CONFIDENTIAL
 - Print: [Formatted State Name]

- Print: [Formatted District Name]
- Print: Grade [Two Digit Test Grade]

School, District, and State Summary Report

Report Delivery

- Each participating Partner with at least one student included the “Number Enrolled” calculation will receive a State Summary Report.
- Each district with at least one student included the “Number Enrolled” calculation will receive a District Summary Report.
- Each school with at least one student included in the “Number Enrolled” will receive a School Summary Report.
- Static PDFs will be generated to be posted online. The report is not printed.
- **Pre-Standard Setting: Each static PDF will contain a page for ELA and a page for Math**
- **Post-Standard Setting: For Partners who participated in Science, each static PDF will contain a page for ELA, a page Math, and a page for Science**

Introduction to the MSAA

Purpose

The Multi-State Alternate Assessment (MSAA) is a comprehensive assessment system, designed to promote increasing higher academic outcomes for students with the most significant cognitive disabilities, in preparation for a broader array of post-secondary outcomes. The MSAA is designed to assess students with the most significant cognitive disabilities and measures academic content that is aligned to and derived from each participating state’s content standards. This assessment contains many built-in supports that allow students to use materials they are most familiar with, and communicate what they know and can do as independently as possible. The MSAA is administered in the areas of English Language Arts (ELA) and Mathematics in grades 3–8 and 11. Arizona, the Bureau of Indian Education (BIE), Maine, and the United States Virgin Islands (USVI) also administered Science in grades 5, 8, and 11.

The ELA and mathematics assessments were developed with Cognia through the research and development done by the National Center and State Collaborative (NCSC), and is now carried forward by the MSAA Partners, including American Samoa, Arizona, BIE, Commonwealth of the Northern Mariana Islands (CNMI), Department of Defense Education Activity (DoDEA), District of Columbia, Guam, Maine, Montana, South Dakota, Tennessee, and USVI.

This guide provides information regarding the administration and results of the spring 2022 MSAA to district and school personnel.

Student Participation

The criteria for student participation in the MSAA reflect the pervasive nature of a significant cognitive disability. All content areas should be considered by the Individualized Education Program (IEP) team when determining who should participate in this assessment. The table below shows the participation criteria and the descriptors used to determine eligibility for participation for each student. Students must meet the following eligibility criteria:

Participation Criteria	Participation Criteria Descriptors
1. The student has a significant cognitive disability.	Review of student records indicates a disability or multiple disabilities that significantly impact intellectual functioning and adaptive behavior.* *Adaptive behavior is defined as essential for someone to live independently and to function safely in daily life.
2. The student is learning content linked to grade-level content standards.	Goals and instruction listed in the IEP for this student are linked to the enrolled grade-level content standards and address knowledge and skills that are appropriate and challenging for this student.
3. The student requires extensive direct individualized instruction and substantial supports to achieve measurable gains in the grade and age-appropriate curriculum.	The student (a) requires extensive, repeated, individualized instruction and support that is not of a temporary or transient nature, and (b) uses substantially adapted materials and individualized methods of accessing information in alternative ways to acquire, maintain, generalize, demonstrate, and transfer skills across multiple settings.

Assessments for students with the most significant cognitive disabilities rely on a foundation of communicative competence. Students who do not have receptive and expressive communication are unlikely to be able to demonstrate what they know and can do on an assessment. Students who do not have a mode of communication are identified during the assessment process.

Post assessment, teachers may use the Communication Toolkit developed by NCSC to help these students develop a mode of communication. The Toolkit can be found here:

wiki.ncscpartners.org/index.php/Communication_Tool_Kit.

Overview of the MSAA Format

The MSAA assesses ELA (reading and writing) and mathematics at grades 3–8 and 11 and is aligned to the state’s content standards and the MSAA Core Content Connectors. The MSAA is a computer-based, on-demand, stage-adaptive assessment consisting mostly of selected response and some constructed-response items written at three levels of complexity. These complexity levels represent different levels of skill acquisition by students.

Students with the most significant cognitive disabilities often need materials and instructional strategies that are substantially adapted, scaffolded, and have built-in supports to meet their individual needs.

The MSAA levels of complexity are designed to follow instructional practices. When students begin to learn a new skill, or acquire new knowledge, they need more support. As students learn and develop mastery of that skill or knowledge, they need less support. The test items on the MSAA are developed with many scaffolds and supports embedded within the items. Supports not embedded in the test items may be provided as accommodations, as well as other allowable ways to present the item to a student, based on their individual requirements.

The assessment is a computer-based test and is administered one-on-one. Based on the needs of the student, the assessment may also be delivered in a paper-pencil format. The needs of the student may also be addressed through other supports and accommodations, such as reading the test aloud, having a scribe, using manipulatives, using object replacement, translating the test into American Sign Language, among others. Test administrators (TAs) have substantial leeway in developing a testing schedule, with the ability to start and stop a test depending on the engagement of the student.

Each content area consists of 45–55 items across two test sessions. These are primarily selected-response items with some constructed-response items. The writing portion of the ELA test contains a scaffolded writing prompt at each grade level.

Arizona, BIE, Maine, and USVI also administered Science in grades 5, 8, and 11. The Science test is aligned to the state’s content standards and the Extended Performance Expectations. The science assessment is also computer-based and consists of selected-response items.

Scoring

Scoring of most items is accomplished within the online test platform. The selected-response items are scored as correct or incorrect by the test platform based on the answer keys programmed into the system. Constructed-response items are scored by the TA and then marked correct or incorrect in the test platform. Items without responses receive a score of zero. Student responses to writing prompts are hand scored by trained scorers utilizing the rubrics in [Appendix A](#).

Overview

This guide describes the types of score reports provided for the 2021–22 MCAA administration. The data in the sample reports are for illustrative purposes only and are not intended to reflect performance of any student(s).

Information included on the score reports:

- **Performance Levels** describe how the student performed in relation to the knowledge and skills of that content area and grade level. Each performance level has two components: the scale scores that make up each level and the performance level descriptors (PLD). The PLDs are broad and general statements regarding skills and abilities of students who have attained each level. Performance levels for the MCAA were established by committees of educators after the first NCSC administration of the assessment in 2015 and were updated in 2018. PLDs for each grade level of ELA and mathematics can be found in [Appendix B](#) of this document. The scale score ranges that make up each performance level for ELA and mathematics can be found in [Appendix C](#).
- **Scale scores** report the performance level the student achieved. Scale scores are more precise than performance levels and may be used to make comparisons between groups of students, schools, and districts. In [Appendix C](#), Table 1 shows the scale score ranges for each performance level and grade level for ELA and mathematics.
- **Descriptive and informative reports.** In addition to including student demographic information, performance level, and scale scores, the Individual Student Report (ISR) contains supportive information about student performance and MCAA measures.
 - **Reading and Writing Scores**—the percent of items answered correctly for reading and writing separately. The writing items consisted of selected response and constructed response (or multiple choice and the writing prompt).
 - **What skills can be worked on next?**—skills related to the standards in the following grade.
 - **What now?**—conversation starters for parents when talking with teachers about instruction for their child.

Interpreting and Using the MCAA Scores

The MCAA tests student performance in ELA and mathematics based on the state’s content standards at the student’s enrolled grade level. The student’s performance level is based on alternate academic achievement standards. Results for the MCAA are reported by a scale score and performance level for each content area.

MCAA scores should be used in conjunction with the IEP progress reports, student work, diagnostic assessments, district-required assessments, and report cards in order to place the student’s performance on academic content and skills in context and to provide a complete picture of the student’s progress across a wide range of categories.

It is helpful to read the PLDs to understand the expectations for the performance level and grade level for each student. This information can provide a concrete link from the test to instructional planning.

Talking to Parents and Guardians

MCAA parent overviews are available for parents to introduce and describe the assessment. Contact your MCAA State Representative to locate these materials.

When talking to parents and guardians about their child's score, it may be helpful to keep the following in mind:

- MCAA assessment results should be used along with local assessment results and other information to determine what changes in curriculum and instruction may be needed to support their student's learning.
- MCAA scores alone should not be used to make placement or eligibility decisions.

Special Reporting Codes and Messages

In some cases, students were assigned a special reporting code. A complete list of special reporting codes and their associated descriptions is provided below. For additional information or interpretation of special reporting codes, contact your MCAA State Representative.

Code	Test Status	Description
ESR	Early Stopping Rule	If the TA did not observe a student response after the presentation of four items, the test was closed by the test coordinator (TC).
ESM	Early Stopping Rule Misadministration	Testing may have ended early on the basis that a consistent mode of communication was not observed. At least one response was recorded for the student, but the student may not have had the opportunity to complete the entire test.
INC	Tested – Incomplete	The student's test was not submitted by the close of testing. The student may not have had the opportunity to complete the entire test.
TES	Test	The student's test was submitted by the close of testing.
IRR	Administration Irregularity	An administration irregularity not necessitating an invalidation of scores was reported for the student's test.
INV	Invalidated	The results of the student's test have been invalidated.
PRF	Parental Refusal	The student did not test due to a parent/guardian refusal.
ELL	ELL Exempt (ELA Only)	The student was exempt from ELA testing due to being a first year English Language Learner.
EXE	Exempt (Emergency, Medical, Other)	The student was exempt from testing.
DNT	Did Not Test	The student did not test via the MCAA assessment.
WDR	Withdrew	The student withdrew.
NLE	No Longer Eligible	The student is not eligible to test via the MCAA assessment.

Types of Score Reports

Below are the types of MSAA score reports that will be available on the MSAA Reporting Portal. Only district TCs using their current MSAA username and password may access the MSAA reports here: www.msaaassessment.org under the Reporting tab. Reports are only available during the online reporting window. All MSAA score reports are confidential documents.

- Reports for the District
 - o District Summary Report (DSR)
 - o District Roster Report (DRR)
 - o Student Results File
- Reports for the School
 - o School Summary Report (SSR)
 - o School Roster Report (SRR)
 - o Individual Student Report
 - o Student Results File

An Excel file of all student results at the district and school level will be available to district TCs through the MSAA Reporting Portal. For information regarding this file or questions about accessing the reports, contact your MSAA State Representative. Contact information can be found at the beginning of this document.

Testing Participation

All students in grades 3–8 and 11 are required to be assessed in ELA and mathematics. Participation status is assigned independently for ELA and mathematics.

All submitted tests receive a participation status, regardless of the number of item responses.

For additional information regarding the reported test status, contact your MSAA State Representative. Contact information can be found at the beginning of this document.

District Summary Report

The DSR provides district staff with a summary of student participation and performance by district and school. State-level data is taken from the individual participating state. See Figure 1 below.

Figure 1. Sample District Summary Report

		CONFIDENTIAL											
		1 English Language Arts										2 SUMMARY REPORT Demonstration State Demonstration District A

	District	19	18	1	1233	16	89	2	11	0	0	0	0

The DSR contains the following features, highlighted above:

1. Content area of the report.
2. State and district included in the report.
3. Number of students by grade that were enrolled, tested, did not test, and average scale score by state and district.
4. The number and percentage of students at each performance level by grade in the state and district.

District Roster Report

The DRR provides district staff with a summary of student scale scores and performance levels by district and state. State-level data is taken from the individual participating state. See Figure 2 below.

State Comparison Key - Performance is lower than state average = Performance is similar to state average + Performance is greater than state average	* For descriptions of the Test Statuses, see your State's Guide for Score Report Interpretation.
----------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------

© 2021 MSAA. All rights reserved. Page 1

The DRR contains the following features, highlighted above:

1. Content areas of the report.
2. State and district included in the report.
3. Number of students that were enrolled, tested, the average scale score, and the percentage of students at each performance level by state and district.
4. The test status, state comparison, scale score, and performance level by student and content area. Refer to the Special Reporting Codes and Messages for information regarding test status.

Reports for the School

School Summary Report

The SSR provides summarized performance information at the state, district, and school level for each grade, including number of students enrolled, tested, did not test, as well as average scale score and performance level. See Figure 3 below.

Figure 3. Sample School Summary Report

	School	9	9	0	1232	9	100	0	0	0	0	0	0

The SSR contains the following features, highlighted above:

1. Content area of the report.
2. State, district, and school included in the report.
3. Number of students by grade that were enrolled, tested, did not test, and average scale score by state, district, and school.
4. The number and percentage of students at each performance level by grade in the state, district, and school.

School Roster Report

The SRR provides student performance information at the school level for each grade, including each student’s test status, scale score, and performance level. See Figure 4 below.

Figure 4. Sample School Roster Report

The SRR contains the following features, highlighted above:

1. The state, district, and school included in the report.
2. A summary of enrolled and tested students and the average scale score for the state, district, and reported school. The results are displayed by content area.
3. For each content area, the student’s test status, comparison to other students in the same grade level in the state, scale score, and performance level are displayed.
4. This section of the report includes all students tested at the school for the specified grade.
5. This key shows symbols used in the “State Compare” column.

Individual Student Report

The ISR provides scale score and performance level information for a specific student. Figure 5 shows page 1 of the ISR. Full samples of the ISR are included in [Appendix D](#).

School: Demonstration School 1
Test Date: Spring 2022
Grade: 05

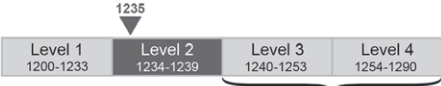

What Is In This Report?
Page 1: Contains a summary of your child's performance on this year's test.
Page 2: Contains an introductory letter from MSAA and next steps to support your child.

Performance Summary
FirstName1's performance in English Language Arts and Mathematics is described below.

English Language Arts

Performance Level	Score
Level 2	1235

1235

Meets Expectations

A student's test score can vary. If your child were to be tested again, it is likely that they would receive a score between 1232 and 1248.

English Language Arts consists of Reading and Writing. See below for percent of possible points earned in each area.

Reading 42% Writing 44%

Mathematics

Performance Level	Score
Level 3	1249

1249

Meets Expectations

A student's test score can vary. If your child were to be tested again, it is likely that they would receive a score between 1245 and 1253.

Performance Level Descriptors

The scale score and performance level for each content area above summarize FirstName1's performance on the English Language Arts (ELA) and Mathematics tests. The performance level descriptors below describe the knowledge and skills that children who perform at this level generally demonstrate.

English Language Arts

- ✓ use brief literary texts to identify the central idea and supporting details, answer questions about the text, and describe the relationship between characters and character and setting
- ✓ use brief informational texts to identify the purpose of and use information presented in charts, graphs, diagrams, or timelines to answer questions, and identify and support the main idea of a text with details
- ✓ use context to define multiple meaning words
- ✓ identify simple words (i.e., CVC words)
- ✓ identify elements of a narrative text to include beginning, middle, and end
- ✓ identify the category related to a set of facts
- ✓ write a narrative with limited command of organization, idea development and/or conventions

Mathematics

- ✓ solve addition, subtraction, and multiplication problems using mathematical language and symbolic representations (e.g., <, >, =)
- ✓ check the correctness of an answer
- ✓ find the missing term in a list of numbers that follow a pattern
- ✓ round numbers
- ✓ identify figures divided into equal parts
- ✓ compare fraction models
- ✓ count unit squares to total the area of a rectangle
- ✓ complete a bar graph

The ISR contains the following features, highlighted above:

1. The report header includes the student's full name, student ID, school, and grade.
2. The results for each content area are displayed separately on the report.
3. The student's scale score and performance level for each content area are shown.
4. This display shows the student's score compared to the performance level scale.
5. This text shows the PLD for the student's performance level.

The essay includes at a minimum: <ul style="list-style-type: none"> an introduction that states the claim and is supported by two rational reasons a body that includes two reasons related to the claim a conclusion that states the claim and is supported by two rational reasons 	The essay includes at a minimum: <ul style="list-style-type: none"> an introduction that states the claim a body that includes one reason related to the claim a conclusion that states the claim with one rational reason or relevant evidence 	The essay includes at a minimum: <ul style="list-style-type: none"> some evidence related to the specified claim/topic (i.e., introduction, claim/topic, or conclusion) 	0 • no evidence of organization	5 • evidence is off topic
Idea Development – The defended claim includes relevant evidence, and uses words, phrases, and clauses to clarify the relationship among claim, reasons, and evidence.	The essay includes at a minimum: <ul style="list-style-type: none"> one piece of relevant evidence that follows each of the two provided reasons words or phrases that connect each of the two reasons with relevant evidence 	The essay includes at a minimum: <ul style="list-style-type: none"> a body with one reason and one piece of relevant evidence a word or phrase that connects one reason with one piece of relevant evidence 	The essay includes at a minimum: <ul style="list-style-type: none"> one word related to the reason or a connecting word or phrase 	0 • no evidence of idea development	5 • evidence is off topic
Conventions – Students use standard English conventions (e.g., capitalization, end punctuation, subject-verb agreement).	The essay includes more than one sentence and at a minimum: <ul style="list-style-type: none"> capitalization at the beginning of the majority of thought units end punctuation for the majority of thought units one complete sentence that expresses an idea with subject-verb agreement (e.g., “The dog runs.”) 	The essay includes at a minimum: <ul style="list-style-type: none"> capitalization at the beginning of one thought unit end punctuation for one thought unit one complete sentence with subject-verb agreement 	The essay includes at a minimum: <ul style="list-style-type: none"> one use of standard English conventions (capitalization at the beginning of one thought unit, end punctuation for one thought unit or one thought unit with or without subject-verb agreement) 	0 • no evidence of standard English conventions	

Appendix B: Performance Level Descriptors

Performance Level Descriptors for ELA and Mathematics

MSAA developed PLDs for ELA and mathematics at grades 3–8 and 11 through an iterative process involving multiple stakeholder groups. The MSAA partnership developed grade-level PLDs to summarize the knowledge, skills, and abilities (KSAs) prioritized for the MSAA that students need to attain at each level of achievement (Level 1–Level 4). Each performance level is understood to include the KSAs of the preceding performance levels.

The PLDs included in this appendix provide a detailed description for teachers, parents, and the public to see not only what grade-level content a student should know and be able to do in order to meet high expectations, but also the depth, breadth, and complexity of that content.

By using the PLDs, test results become multi-dimensional. Test results in the form of scale scores are one way educators, parents, and guardians find out where a student’s performance is in relation to other students. The PLDs provide another dimension that completes the description of how a student interacts with the standards the test measures. Both of the scale score and the PLDs provide information that helps teachers, schools, parents, and guardians build a path to student learning.

Appendix D: Individual Student Report Samples

CONFIDENTIAL

Name: FirstName1 LastName1
ID: 42382348
School: Demonstration School 1
Test Date: Spring 2022
Grade: 05

What Is In This Report?

Page 1: Contains a summary of your child's performance on this year's test.
Page 2: Contains an introductory letter from MSAA and next steps to support your child.

Performance Summary

FirstName1's performance in English Language Arts and Mathematics is described below.

English Language Arts

Performance Level
Level 2 Score
1235

Meets Expectations

A student's test score can vary. If your child were to be tested again, it is likely that they would receive a score between 1232 and 1248.

English Language Arts consists of Reading and Writing. See below for percent of possible points earned in each area.

Reading 42% **Writing 44%**

Mathematics

Performance Level
Level 3 Score
1249

Meets Expectations

A student's test score can vary. If your child were to be tested again, it is likely that they would receive a score between 1245 and 1253.

Performance Level Descriptors

The scale score and performance level for each content area above summarize FirstName1's performance on the English Language Arts (ELA) and Mathematics tests. The performance level descriptors below describe the knowledge and skills that children who perform at this level generally demonstrate.

English Language Arts

- ✓ use brief literary texts to identify the central idea and supporting details, answer questions about the text, and describe the relationship between characters and character and setting
- ✓ use brief informational texts to identify the purpose of and use information presented in charts, graphs, diagrams, or timelines to answer questions, and identify and support the main idea of a text with details
- ✓ use context to define multiple meaning words
- ✓ identify simple words (i.e., CVC words)
- ✓ identify elements of a narrative text to include beginning, middle, and end
- ✓ identify the category related to a set of facts
- ✓ write a narrative with limited command of organization, idea development and/or conventions

Mathematics

- ✓ solve addition, subtraction, and multiplication problems using mathematical language and symbolic representations (e.g., $<$, $>$, $=$)
- ✓ check the correctness of an answer
- ✓ find the missing term in a list of numbers that follow a pattern
- ✓ round numbers
- ✓ identify figures divided into equal parts
- ✓ compare fraction models
- ✓ count unit squares to total the area of a rectangle
- ✓ complete a bar graph

Dear Parents and Guardians,

This report summarizes your child's performance on the online 2022 Multi-State Alternate Assessment (MSAA). This report shows the scaled score and performance levels in English Language Arts (ELA), Mathematics, and Science. Also shown is the percent of possible points earned in Reading and Writing. The performance level descriptors describe the knowledge and skills that children who perform at this level generally demonstrate.

The MSAA is designed to assess students in grades 3-8 and 11 with significant cognitive disabilities and measures academic content that is aligned to and derived from your state's content standards. The test contains many built-in supports that allow students to take the test using materials they are most familiar with and to communicate what they know and can do. These are some of the built-in supports found in the MSAA:

- shortened ELA reading passages
- pictures, charts, tables, and maps to help students understand the reading passages
- models and examples that explain important ideas and concepts
- smaller numbers on the mathematics tests

To support communication independence to the greatest extent possible, the MSAA is designed to work with different communication modes and systems. Please discuss the supports your child used on the MSAA with your child's teacher.

More information and resources for helping your child are available at your state's alternate assessment web page or by talking with your child's teacher. If you require this letter or your child's report in a different format, please contact your state's department of education.

What skills can be worked on next?

English Language Arts

- + Determine the main idea and supporting details of text
- + Use information from charts, graphs, diagrams to answer questions
- + Use general academic words in reading and writing
- + Produce writing that expresses real or imaginary experiences and ideas

Mathematics

- + Use mathematical terms and symbols (<, >, =)
- + Round numbers to the nearest ten, hundred, or thousand
- + Solve single digit multiplication problems including arrays, models, and word problems
- + Compare fractions with different denominators; identify equivalent fractions
- + Identify perimeter of a rectangle
- + Analyze data in bar graphs
- + Sort two-dimensional shapes

What now?

Bring this report to your next conference with FirstName1's teachers.

You can ask FirstName1's teachers:

- What is FirstName1 learning in ELA and Mathematics this year?
- How is FirstName1 doing?
- How can I use this information to work with FirstName1 this year?
- What resources should I use to support FirstName1?

Performance Summary

FirstName1's performance in Science is described below.

Science

Performance Level

Level 3

Score

1249

A student's test score can vary. If your child were to be tested again, it is likely that they would receive a score between 1245 and 1253.

Performance Level Descriptors

The scale score and performance level for the content area above summarizes FirstName1's performance on the Science test. The performance level descriptors below describe the knowledge and skills that children who perform at this level generally demonstrate.

Science

Information will be added as it becomes available.

Dear Parents and Guardians,

This report summarizes your child's performance on the online 2022 Multi-State Alternate Assessment (MSAA). This report shows the scaled score and performance level in Science. The performance level descriptors describe the knowledge and skills that children who perform at this level generally demonstrate.

The MSAA is designed to assess students in grades 5, 8 and 11 with significant cognitive disabilities and measures academic content that is aligned to and derived from your state's content standards. The test contains many built-in supports that allow students to take the test using materials they are most familiar with and to communicate what they know and can do.

To support communication independence to the greatest extent possible, the MSAA is designed to work with different communication modes and systems. Please discuss the supports your child used on the MSAA with your child's teacher.

More information and resources for helping your child are available at your state's alternate assessment web page or by talking with your child's teacher. If you require this letter or your child's report in a different format, please contact your state's department of education.

What skills can be worked on next?

Science

Information will be added as it becomes available.

What now?

Bring this report to your next conference with FirstName1's teachers.

You can ask FirstName1's teachers:

- What is FirstName1 learning in Science this year?
- How is FirstName1 doing?
- How can I use this information to work with FirstName1 this year?
- What resources should I use to support FirstName1?

APPENDIX—O
DECISION ACCURACY AND CONSISTENCY RESULTS

Table O-1. Summary of Decision Accuracy (and Consistency) Results by Grade—Overall and Conditional on Performance Level

Grade	Overall	Kappa	Conditional on Level			
			Level 1	Level 2	Level 3	Level 4
5	0.74 (0.65)	0.52	0.85 (0.76)	0.46 (0.35)	0.74 (0.67)	0.86 (0.74)
8	0.71 (0.62)	0.48	0.79 (0.73)	0.58 (0.45)	0.52 (0.42)	0.87 (0.78)
11	0.68 (0.60)	0.43	0.84 (0.76)	0.38 (0.30)	0.50 (0.38)	0.83 (0.72)

Table O-2. Summary of Decision Accuracy (and Consistency) Results by Grade—Conditional on Cutpoint

Grade	Level 1/Level 2				Level 2/Level 3				Level 3/Level 4			
	Accuracy	Consistency	False		Accuracy	Consistency	False		Accuracy	Consistency	False	
			Positive	Negative			Positive	Negative			Positive	Negative
5	0.89	0.85	0.04	0.06	0.90	0.86	0.05	0.05	0.94	0.91	0.04	0.02
8	0.87	0.83	0.07	0.06	0.90	0.86	0.04	0.06	0.92	0.89	0.05	0.03
11	0.85	0.79	0.07	0.08	0.87	0.82	0.08	0.05	0.93	0.89	0.04	0.03

Note: Due to the small sample size, students in Levels 3 and 4 were collapsed for purposes of the decision accuracy and consistency analysis.

APPENDIX—P
LIST OF ACRONYMS

Terms and Acronyms Used in the 2022 MSAA Technical Report

2PL	two-parameter logistic
AA-AAAS	Alternate Assessment Aligned with Alternate Academic Achievement Standards (current use under ESSA)
AAC	augmentative and alternative communication
AERA	American Educational Research Association
ANOVA	analysis of variance
APA	American Psychological Association
BIE	Bureau of Indian Education
CCC	Crosscutting Concepts
CSEM	conditional standard error of measurement
CTT	Classical Test Theory
DAC	decision accuracy and consistency
DCI	Disciplinary Core Ideas
DETECT	Dimensionality Evaluation to Enumerate Contributing Traits
DIF	differential Item functioning
DIMTEST	computer program used by Cognia
DNU	do not use
DOK	Depth of knowledge
DTA	Directions for Test Administration
ELA	English language arts
EOTS	end-of-test survey
EPE	extended performance expectations
ESEA	Elementary and Secondary Education Act
ESR	early stopping rule
ESSA	Every Student Succeeds Act
FCIP	Fixed Common Item Parameter
HOSS	highest obtainable scale score
HS	High school
ICC	item characteristic curve
ICTC	item category threshold curve
IEP	individualized education program
IIF	Item information function
IRT	Item Response Theory
IT	information technology
KSA	knowledge, skills, and ability
LAL	Links for academic learning
LEP	limited English proficiency
LOSS	lowest obtainable scale score
LI	local independence
LID	local item independence
MSAA	Multi-State Alternate Assessment

continued

Terms and Acronyms Used in the 2022 MSAA Technical Report

NCME	National Council on Measurement in Education
NCSC	National Center and State Collaborative
NGSS	next generation science standards
PARSCALE	Item response theory (IRT) software program that can perform item analysis and test scoring for dichotomous and polytomous IRT models
PBT	paper-based test
PE	performance expectations
PLAAFP	present level of academic achievement and functional performance?
PLD	performance level descriptor
R9-stringer	student who responds to nine (or more) consecutive multiple-choice items with the exact same option
SCD	Significant cognitive disabilities
SD	standard deviation
SEM	standard error of measurement
SEP	Science and engineering practices
SIU	score interpretations and uses
SQA	Software Quality Assurance
SRC	student response check
TA	test administrators
TC	Test coordinators
TAC	Technical Advisory Committee
TAM	Test Administration Manual
TC	test coordinators
TCC	test characteristic curve
TIF	test information function
UDL	Universal Design for Learning
UWC	use with caution
VI	Volume of Information
