## RIT Score <br> Comparability

## Maine Through Year Assessment and

MAP Growth

## Topics

- Dimensionality: Do the MAP Growth and Through Year Assessments measure similar constructs?
- Comparisons for Spring 2023 "Double-Testers"
- Consideration that Impacts Comparability: Time Between Assessments
- Standard Error of Measurement
- Pearson Correlation Coefficient
- Score Comparisons Breakdown by Grade Level: Reading and Math
- Trends in Fall-to-Spring RIT Score Growth

## Dimensionality

## Do the MAP Growth and Maine Through Year Assessment measure similar constructs?

## MAP Growth Assessment Construction

## Spring Through Year Assessment Construction

## Key Assumption

Key assumption required to align Maine summative questions to the RIT scale:
Maine summative and MAP Growth items measure very similar constructs.

- Assessment items are the questions students answer.
- The construct is the knowledge, skill, or ability the assessment is intended to measure.
- Broad examples of constructs are math achievement and reading ability.

Education

## Dimensionality

Dimensions are the characteristics that are assessed or influence the results of the assessment.
Examples:

- Math achievement
- Type of test
- Reading ability

Multidimensionality: Occurs when multiple underlying dimensions influence scores
Unidimensionality: Occurs when a single underlying dimension influences scores

# A math assessment should measure math achievement and nothing but math achievement. 

Unidimensionality

## DETECT

Are the data unidimensional enough that Maine summative items can be aligned to the RIT scale?

DETECT = Dimensionality Evaluation to Enumerate Contributing Traits

- Non-parametric test
- No assumptions are made about the frequency distribution of the data being assessed (e.g., normal distribution or "bell curve")
- Flexible test that can be applied to different types of data
- Estimates the number of dimensions and, if multiple dimensions are present, identifies which dimension is predominantly measured

## DETECT Values for Math and Reading Tests

| Grade | Math | Reading |
| :--- | :--- | :--- |
| 3 | -0.29 | -0.54 |
| 4 | 0.19 | -0.24 |
| 5 | -0.21 | -0.22 |
| 6 | 0.11 | -0.63 |
| 7 | -0.15 | -0.47 |
| 8 | -0.64 | -0.24 |
| High School | -0.41 | -1.07 |

< 0.2 Essential unidimensionality
0.2-0.4 Weak multidimensionality
0.4-1 Moderate multidimensionality

## Comparisons for "Double-Testers"

Students Who Were Administered Both the MAP Growth and<br>Through Year Assessments

# Consideration that Impacts Comparability 

Time Between Assessments

## Data Set: Spring 2023

- 9,784 MAP Growth assessments in Reading
- Average of 1,398 assessments per grade level
- 10,221 MAP Growth assessments in Math
- Average of 1,460 assessments per grade level

## Time Between Tests: Reading

| Grade <br> Level | Median Number of <br> Days Between Tests |
| :--- | :--- |
| 3 | -3 |
| 4 | -3 |
| 5 | -7 |
| 6 | -5 |
| 7 | -7 |
| 8 | -8 |
| High <br> School | -8 |

Positive values:
Maine Through Year Assessment after MAP Growth

Negative values:
Maine Through Year Assessment before MAP Growth

## Time Between Tests: Reading

Dotted lines:
Range from the minimum to maximum number of days between tests Example: Grade 4 is approximately -60 to +35 days

Dark, horizontal line: Median number of days between tests for each grade level

Shaded region: The range of days between testing for the middle $50 \%$ of students

Empty circles:
Outliers, or extreme values

## Time Between Tests: Math

| Grade <br> Level | Median Number of <br> Days Between Tests |
| :--- | :--- |
| 3 | 5 |
| 4 | 4 |
| 5 | -6 |
| 6 | 1 |
| 7 | -8 |
| 8 | -12 |
| High <br> School | -10 |

Positive values:
Maine Through Year Assessment after MAP Growth

Negative values:
Maine Through Year Assessment before MAP Growth

## Time Between Tests: Math

Dotted lines:
Range from the minimum to maximum number of days between tests Example: Grade 4 is approximately -70 to +35 days

Dark, horizontal line: Median number of days between tests for each grade level

Shaded region: The range of days between testing for the middle $50 \%$ of students

Empty circles:
Outliers, or extreme values

## Time Between Tests

- The amount of time that elapsed for some students between tests was larger than a month.
- Opportunity to learn new content
- Different testing conditions (e.g., time) could impact student results.

# Standard Error of Measurement 

## Standard Error of Measurement (SEM)

- All achievement test scores are estimates of a student's trait, in particular a latent trait that cannot be seen, for example "math knowledge" or "reading ability."
- Because the trait cannot be seen, test developers make inferences based on the student's answers to a range of questions that have been anchored to the trait.
- The standard error of measurement (SEM) indicates a score's precision.
- Multiple factors can impact the student's score, or estimated ability:
- Careless errors by the student
- Lucky guesses by the student
- Distractions in the testing environment
- Idiosyncrasies in the assessment content
- Example: When calculating SEM, one aspect NWEA considers is, Was the student's answering pattern predictable or erratic?

## RIT Score Standard Error of Measurement

- Compared ta hes overall score. Eugene has strengths in Geometry and strengths when he is learning new material.

1) To heip Eugene boost his performance in machematics and berter mach his USS national peen, review his scores in the instructional Areas to find silils and concepte that he is ready to iemm.

The student's score of 203 is an estimate. The SEM of +/- 3 RIT points, indicates that the student's true score would likely fall between 200-206 RIT points.

Maine

Department of
Deparment of
Education

## Looking a Little More Closely

The student's score of 203 is an estimate.
The SEM of +/- 3 RIT points, indicates that the student's true score would likely fall between 200-206 RIT points.

## Confidence Intervals

- 200-206 is the range within which there is a $68 \%$ chance that a student's true score lies, with 203 representing the most likely estimate of this student's score.
- Expanding the range around the estimated score increases the confidence interval.
- For example, $\pm 2$ SEM, or approximately $\pm 6$ RIT, corresponds to a $95 \%$ confidence interval. There is a $95 \%$ chance that a student's true score lies within 197-209 RIT points.

# Typical SEM for MAP Growth ranges from 2.8 to 3.5 RIT score points.

## RIT Score Difference Comparison

Reading Score Difference Comparison between Maine/MAPG and MAPG/MAPG

## What are the next steps to improve comparability for Reading RIT?

- All Grades
- Addition of stand-alone items that are not linked to a lengthy reading passage
- All items in NWEA's through-year, summative item bank are linked to reading passages
- Will need to pull standalone items from the MAP Growth item bank for the diagnostic portion of the assessment

## What are the next steps to improve comparability for Reading RIT?

- High School
- Operational field test
- NWEA's other through-year assessment state partners do not use NWEA for their high school assessments.
- All summative questions were new and never previously administered to students.
- Given the timeline for submission of evidence to US DOE for peer review, a true field test was not possible.
- Maine DOE is requesting that NWEA re-examine the RIT score alignment of the high school reading summative questions.
- Discrepancy between students' performance according to RIT and Maine-specific scaled scores
- Results from the summative portion of the assessment indicate that, on average, students in high school performed equally well in Reading as students in other grades.

## What are the next steps to improve comparability for Math RIT?

- High School
- Operational field test
- NWEA's other through-year assessment state partners do not use NWEA for their high school assessments.
- All summative questions were new and never previously administered to students.
- Given the timeline for submission of evidence to US DOE for peer review, a true field test was not possible.
- Maine DOE is working with NWEA to examine the most difficult clusters of summative items.
- Difficulty is determined by the percentage of students who answered the item correctly.
- Opportunity to learn
- Complexity of items - Many of the same standards are taught in Algebra I and Algebra II, at varying levels of complexity.

# Trends in Fall-ło-Spring RIT Score Growth 

# 2021-2022 and 

2022-2023

## NWEA Research Brief: 2022-23 Achievement Data

- Education's long COVID: 2022-23 achievement data reveal stalled progress toward pandemic recovery
- July 2023
- Center for School and Student Progress, research branch of NWEA
- Achievement gains during 2022-23 fell short of prepandemic trends.
- The 2020 NWEA national norms currently used to determine achievement and growth percentiles are based on data from 2015-2018.
- NWEA releases new norms every 4-5 years.

Fall-to-spring achievement gains during 2022-23 relative to pre-COVID trends

Note. The bars depict the percentage difference between 2022-23 fall-to-spring growth and pre-COVID growth trends. These relative gains ratios were calculated by taking the average fall-to-spring change in RIT score for the COVID sample and dividing by the average for the pre-COVID sample. The pre-COVID baseline was the aggregate fall-to-spring growth across the 2016-17, 2017-18, and 2018-19 school years.

According to NWEA's report, this trend in 2022-23 achievement gains (i.e., growth) was lower than what was observed in 2021-22.

## What are we seeing in Maine?

## What data does ME DOE have?

- No access to MAP Growth reports
- No projected RIT
- No percentage of students who met or exceeded their projected RIT
- No percent of projected growth met
- We do have...
- NWEA's 2020 achievement and growth norms
- Fall and Spring RIT scores for 2021-22 and 2022-23 for grades 3-8

## Calculation of an Unrestricted Growth Index

Using 2020 national norms, an individual student growth index is calculated by taking actual fall-to-spring growth and dividing by expected fall-to-spring growth.

| 2020 Reading Student Growth Norms |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Fall-to-Winter |  | Winter-to-Spring |  | Fall-to-Spring |  |
| Grade | Mean | SD | Mean | SD | Mean | SD |
| $\mathbf{K}$ | 9.63 | 5.75 | 6.81 | 5.30 | 16.45 | 7.50 |

Education

## Calculation of an Unrestricted Growth Index: Examples for Individual Students

For Reading, grade 3 expected fall-to-spring growth is, on average, 10.5 RIT points.

2020 Reading Student Growth Norms

|  | Fall-to-Winter |  | Winter-to-Spring |  | Fall-to-Spring |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Grade | Mean | SD | Mean | SD | Mean | SD |
| $\mathbf{K}$ | 9.63 | 5.75 | 6.81 | 5.30 | 16.45 | 7.50 |
| $\mathbf{1}$ | 9.92 | 5.85 | 5.55 | 5.37 | 15.47 | 7.74 |
| $\mathbf{2}$ | 8.85 | 5.86 | 4.37 | 5.37 | 13.22 | 7.77 |
| $\mathbf{3}$ | 7.28 | 5.86 | 3.22 | 5.37 | 10.50 | 7.77 |
| $\mathbf{4}$ | 5.82 | 5.76 | 2.33 | 5.31 | 8.16 | 7.53 |
| $\mathbf{5}$ | 4.64 | 5.75 | 1.86 | 5.30 | 6.50 | 7.49 |
| $\mathbf{6}$ | 3.64 | 5.65 | 1.55 | 5.24 | 5.19 | 7.26 |
| $\mathbf{7}$ | 2.89 | 5.60 | 1.27 | 5.21 | 4.16 | 7.15 |
| $\mathbf{8}$ | 2.51 | 5.73 | 1.14 | 5.29 | 3.65 | 7.46 |
| $\mathbf{9}$ | 1.62 | 6.06 | 0.88 | 5.50 | 2.51 | 8.22 |
| $\mathbf{1 0}$ | 1.43 | 5.88 | 0.60 | 5.38 | 2.04 | 7.80 |
| $\mathbf{1 1}$ | 1.11 | 6.27 | 0.08 | 5.62 | 1.18 | 8.68 |
| $\mathbf{1 2}$ | 0.05 | 6.38 | 0.47 | 5.70 | 0.52 | 8.92 |

## Example 1:

Student's actual growth is 11 RIT points. Actual growth / expected growth = Growth index
11/10.5 = 1.05

## Example 2:

Actual growth $=0$ RIT points
$0 / 10.5=0.00$

## Example 3:

Actual growth $=21$ RIT points
$21 / 10.5=2.00$

## Example 4:

Actual growth = -5 RIT points
$-5 / 10.5=-0.48$

## Average Unrestricted Growth Indices (Statewide)

What does "unrestricted" mean?

- There are no limits on values for individual students.
- Negative values are allowed.
- Outliers are included in the average.
- Given the population size (all students in grades 3-8 who took the state's reading/math assessments), an unrestricted measure is acceptable for statewide data for the purpose of this analysis.
- If looking at smaller populations (i.e., school or SAU), applying restrictions would be appropriate to reduce the impact of extreme outliers on the average.

Education
