GROUTED RIPRAP GUTTER

(To be installed in front of Abut. 2; refer to General Note No. 8)

SPECIFICATIONS

DESIGN - AASHO standard specifications for Highway Bridges 1969 and interim specifications 1970, 1971 & 1972.

CONTRACT - State of Maine, State Highway Commission, Standard Specifications, Highways & Bridges, Revision of June 1968.

DESIGN LOADING

LIVE LOAD - HS20-44

MATERIALS

CONCRETE - Seals - - - - Class S
All other - - Class A

REINFORCING STEEL - ASTM A615 Grade 60

STRUCTURAL STEEL - ASTM A572 Grade 50 & A36 as shown

BASIC ALLOWABLE STRESSES

CONCRETE - f_c = 1200 psi. n = 10

REINFORCING STEEL - f_s = 24,000 psi.

STRUCTURAL STEEL - ASTM A572 Gr.50 - f_s = 27,000 psi.
ASTM A36 f_s = 20,000 psi.
ASTM A325 F_v = 13,000 psi.

GENERAL NOTES

1. All utility plant shall be adjusted by respective utility unless otherwise noted.
2. Refer to highway plans for Construction limits, Right of Way and additional utility plant details.
3. Bituminous treated stone slope protection shall be placed in front of Abut. #2. The exact limits and elevations will be determined in the field by the Engineer.
4. A layer of granular borrow 2'-0" thick shall be placed under the slope protection, except if in the opinion of the Engineer the existing embankment material is suitable.
5. The material used to construct embankments in areas where piles are to be driven shall meet the requirements of sub-section 501.07 of the Standard Specifications.
6. Where granular borrow is required, the material shall meet the requirements for Underwater Backfill given in sub-section 703.19 of the Standard Specifications.
7. A strip of sod 4'-0" wide shall be placed behind abut. #2 wings as shown. The center of the strip shall be recessed 3 to 6 inches to form a gutter. Two inches of loam shall be placed under the sod.
8. A grouted riprap gutter shall be constructed under bridge drains at abut. 2 & shall extend to Elev. 8.

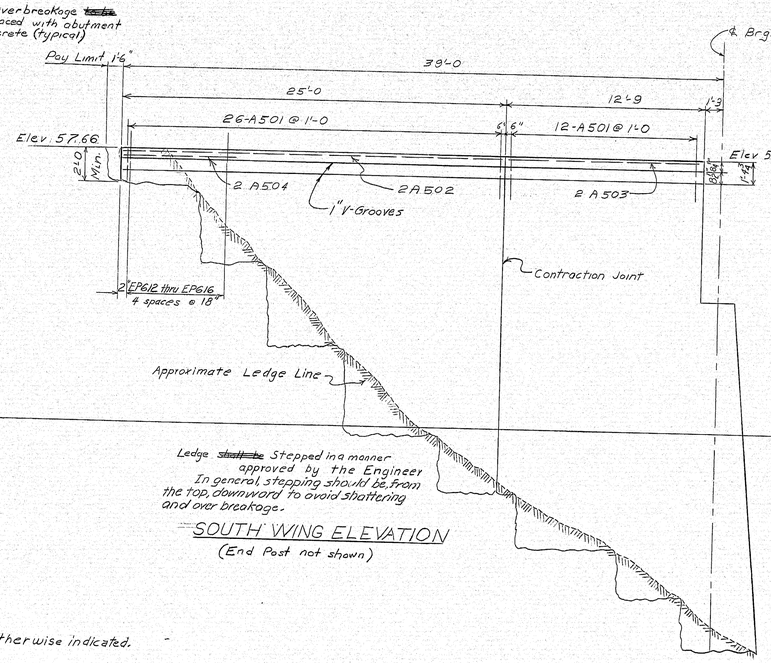
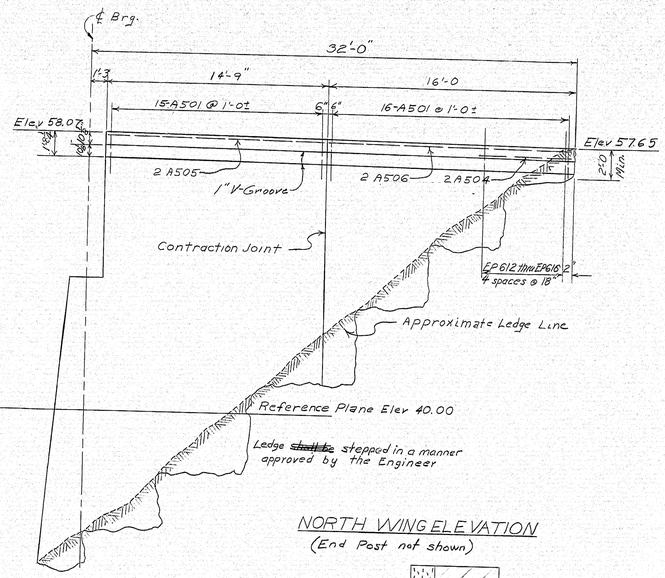
ABUTMENT NOTES

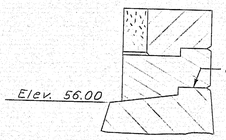
Note
Overbreakage ~~to be~~ replaced with abutment concrete (typical)



SOUTH WING ELEVATION
(End Post not shown)



NORTH WING ELEVATION
(End Post not shown)



ALTERNATE WING CONSTRUCTION DETAIL
(Details except as shown same as in Section A-A)

1. ~~Chamfered~~ all exposed edges of concrete ¾ inch unless otherwise indicated.
2. All reinforcing steel splices and embedments shall be a minimum of 24 bar diameters unless otherwise indicated. Tension splices approved during construction and not shown on plans shall have a 36 bar diameter lapped length.
3. Reinforcing steel shall have 2 inches cover unless otherwise indicated.
4. Place reinforcing steel in bridge seats to clear anchor bolts.
5. ~~Broke~~ bond at vertical contraction joints by a method approved by the Engineer.
6. Place concrete in top of abutment backwalls after the superstructure slab ~~has been~~ was placed.
7. Waterstops are not required in vertical and horizontal joints.
8. Protective Coating for Concrete Surfaces ~~shall be~~ applied to the following areas: all exposed surfaces of wing walls, and Abutment 2 Backwall and breastwall.
9. All structural earth excavation required at abutment #1 in order to reach the ledge foundation ~~will be~~ was paid for at 100% of the contract unit price for Item 206.08.
10. Placed 4 inch diameter drains in breastwall and wings at 20 ft maximum spacing and at all low points in ledge. Exact number and location ~~to be~~ determined by Engineer in the field. French Drain (stones only) ~~shall be~~ constructed according to Section 512.
11. Provided joints in the Vertical Bridge Curb, Type I at each contraction joint in the wing walls.

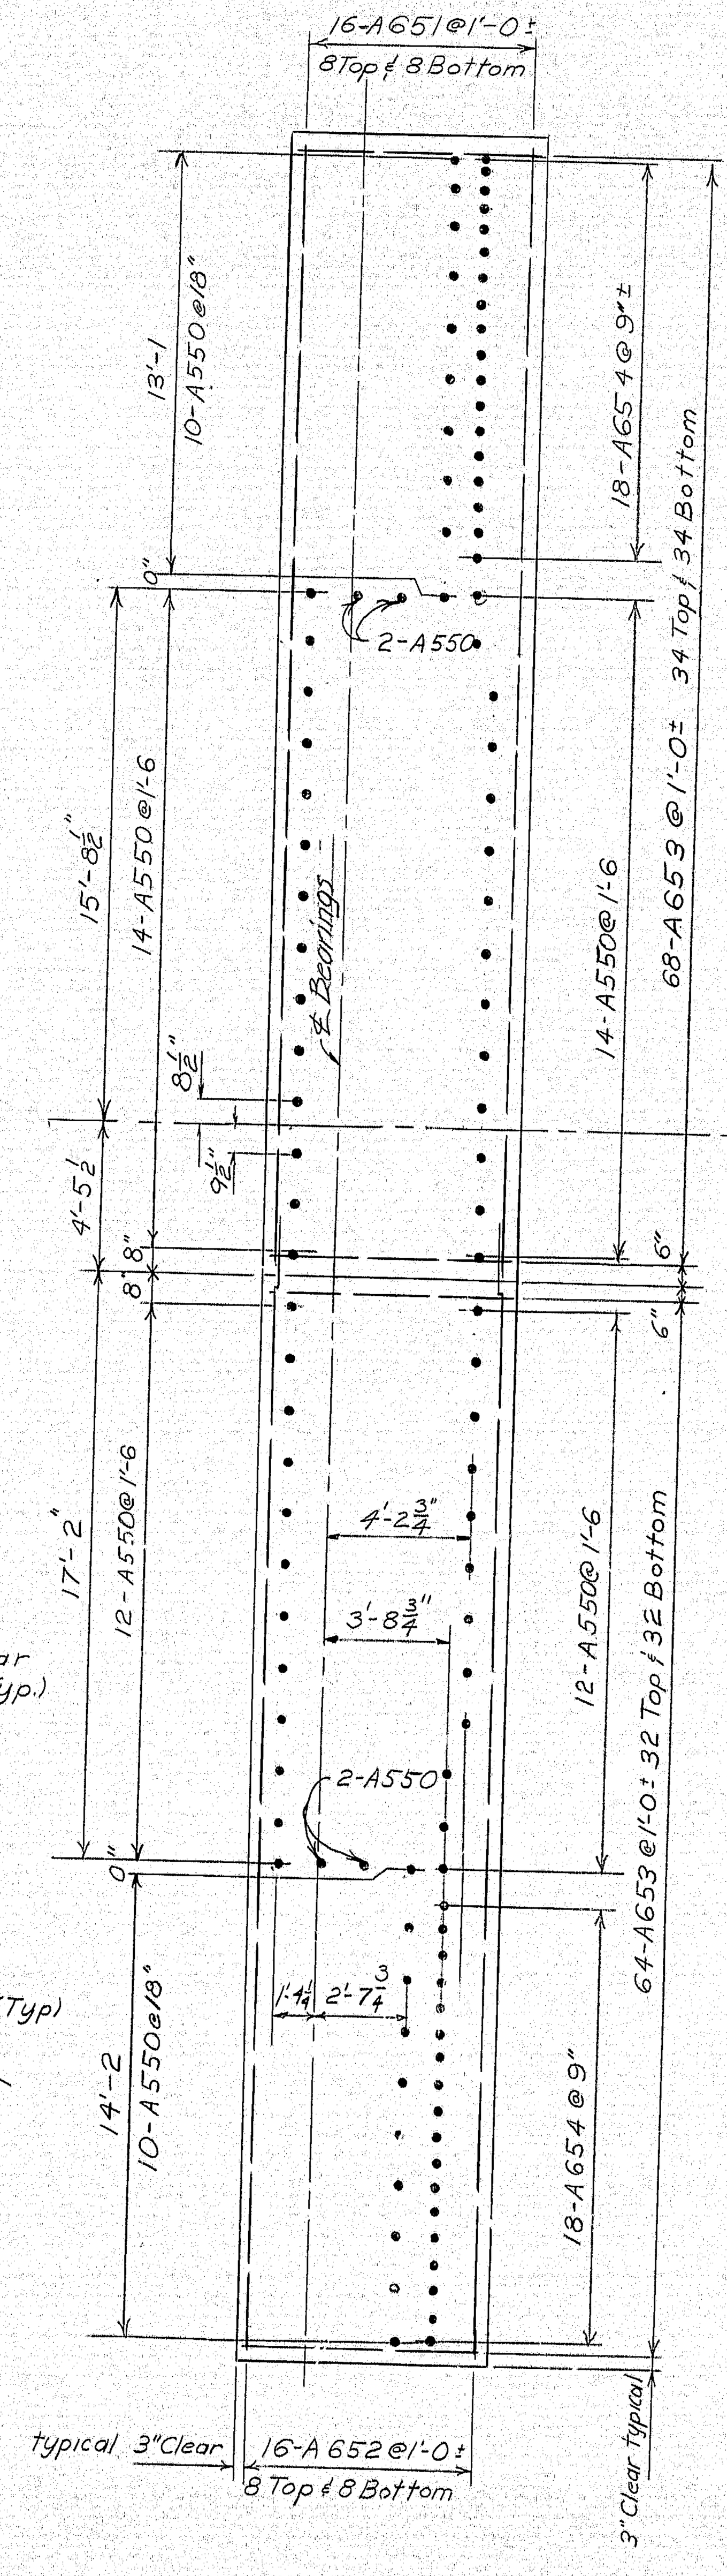
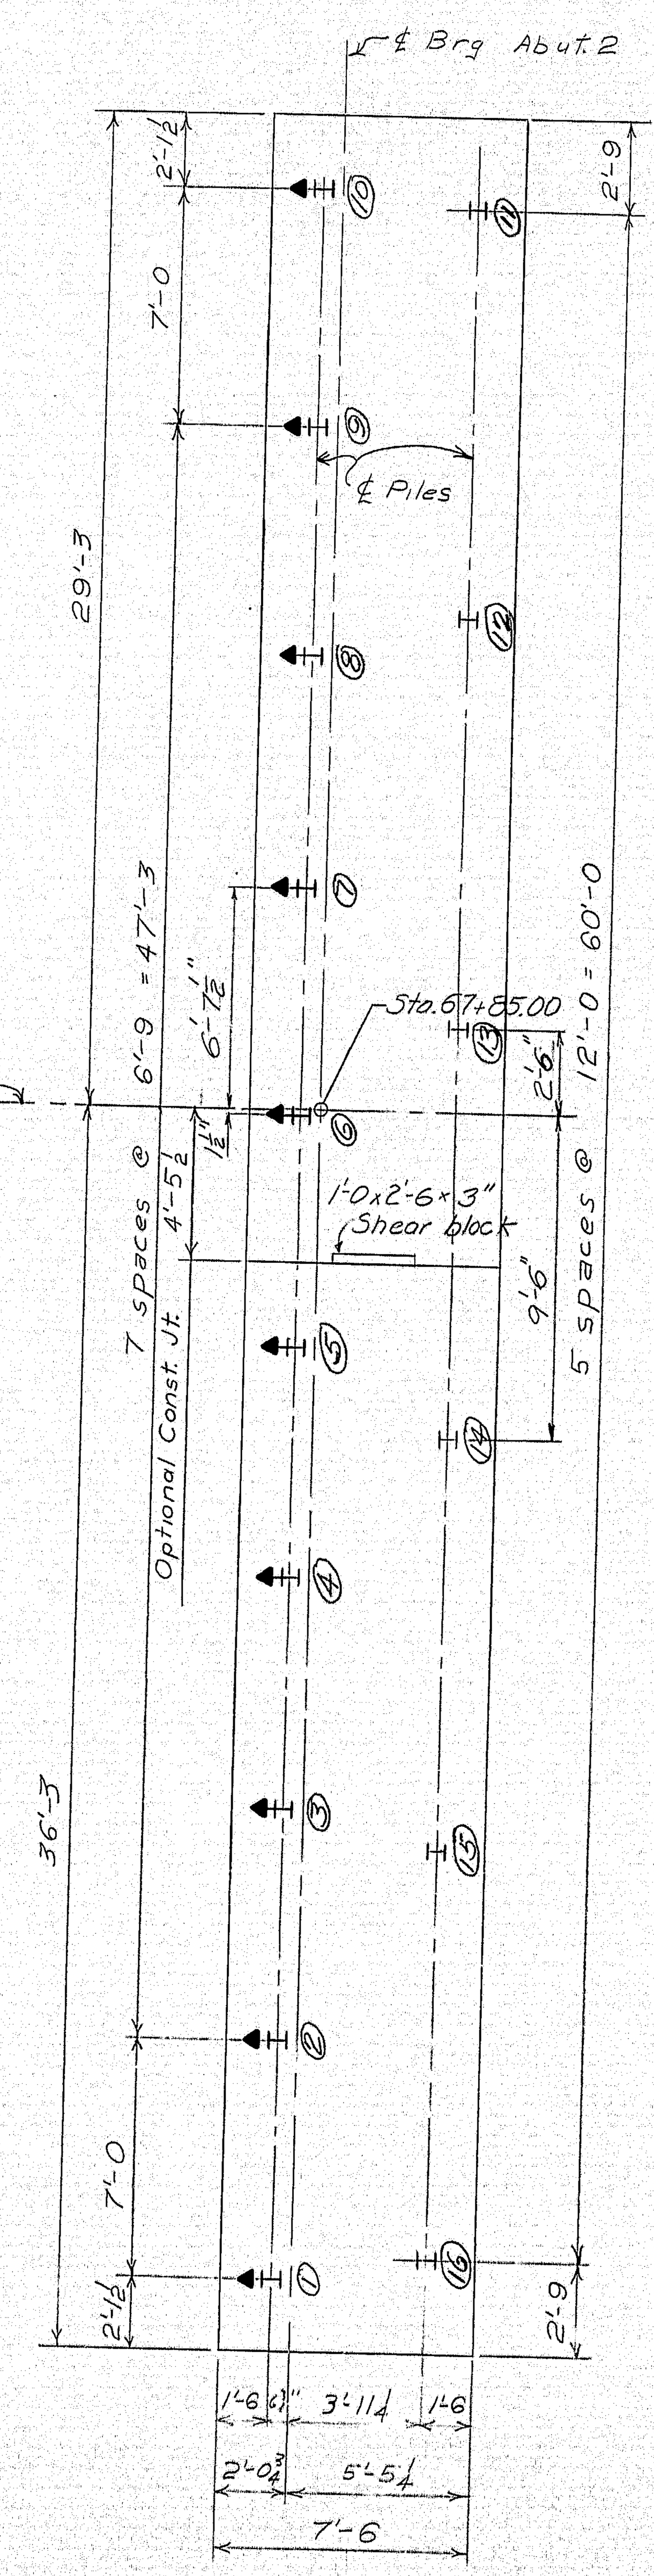
POINTED REINFORCED PILE TIP

Used Pile Point



REINFORCING PLAN



FOOTING & PILE PLAN

PILE NOTES

1. Piles ~~shall be~~ driven to ledge or practical refusal.
2. All piles shall have pointed reinforced tips.
3. (used) Alternate types of pointed reinforced pile tips may be used if they are approved by the Engineer.
4. Estimated driven lengths of piles are determined from available soils information with no allowance for pile cut-offs and no allowance for uncertain pile penetration.
5. Piles marked thus, ⊢+, ~~shall be~~ were battered 1 1/2 inches per foot in the direction of the arrow.
6. Maximum pile load equals: 96 tons.
7. Following are pile locations, number of piles required, size of piles and estimated driven lengths:
   Abutment No. 2 8-HP14x73 @ 50 ft

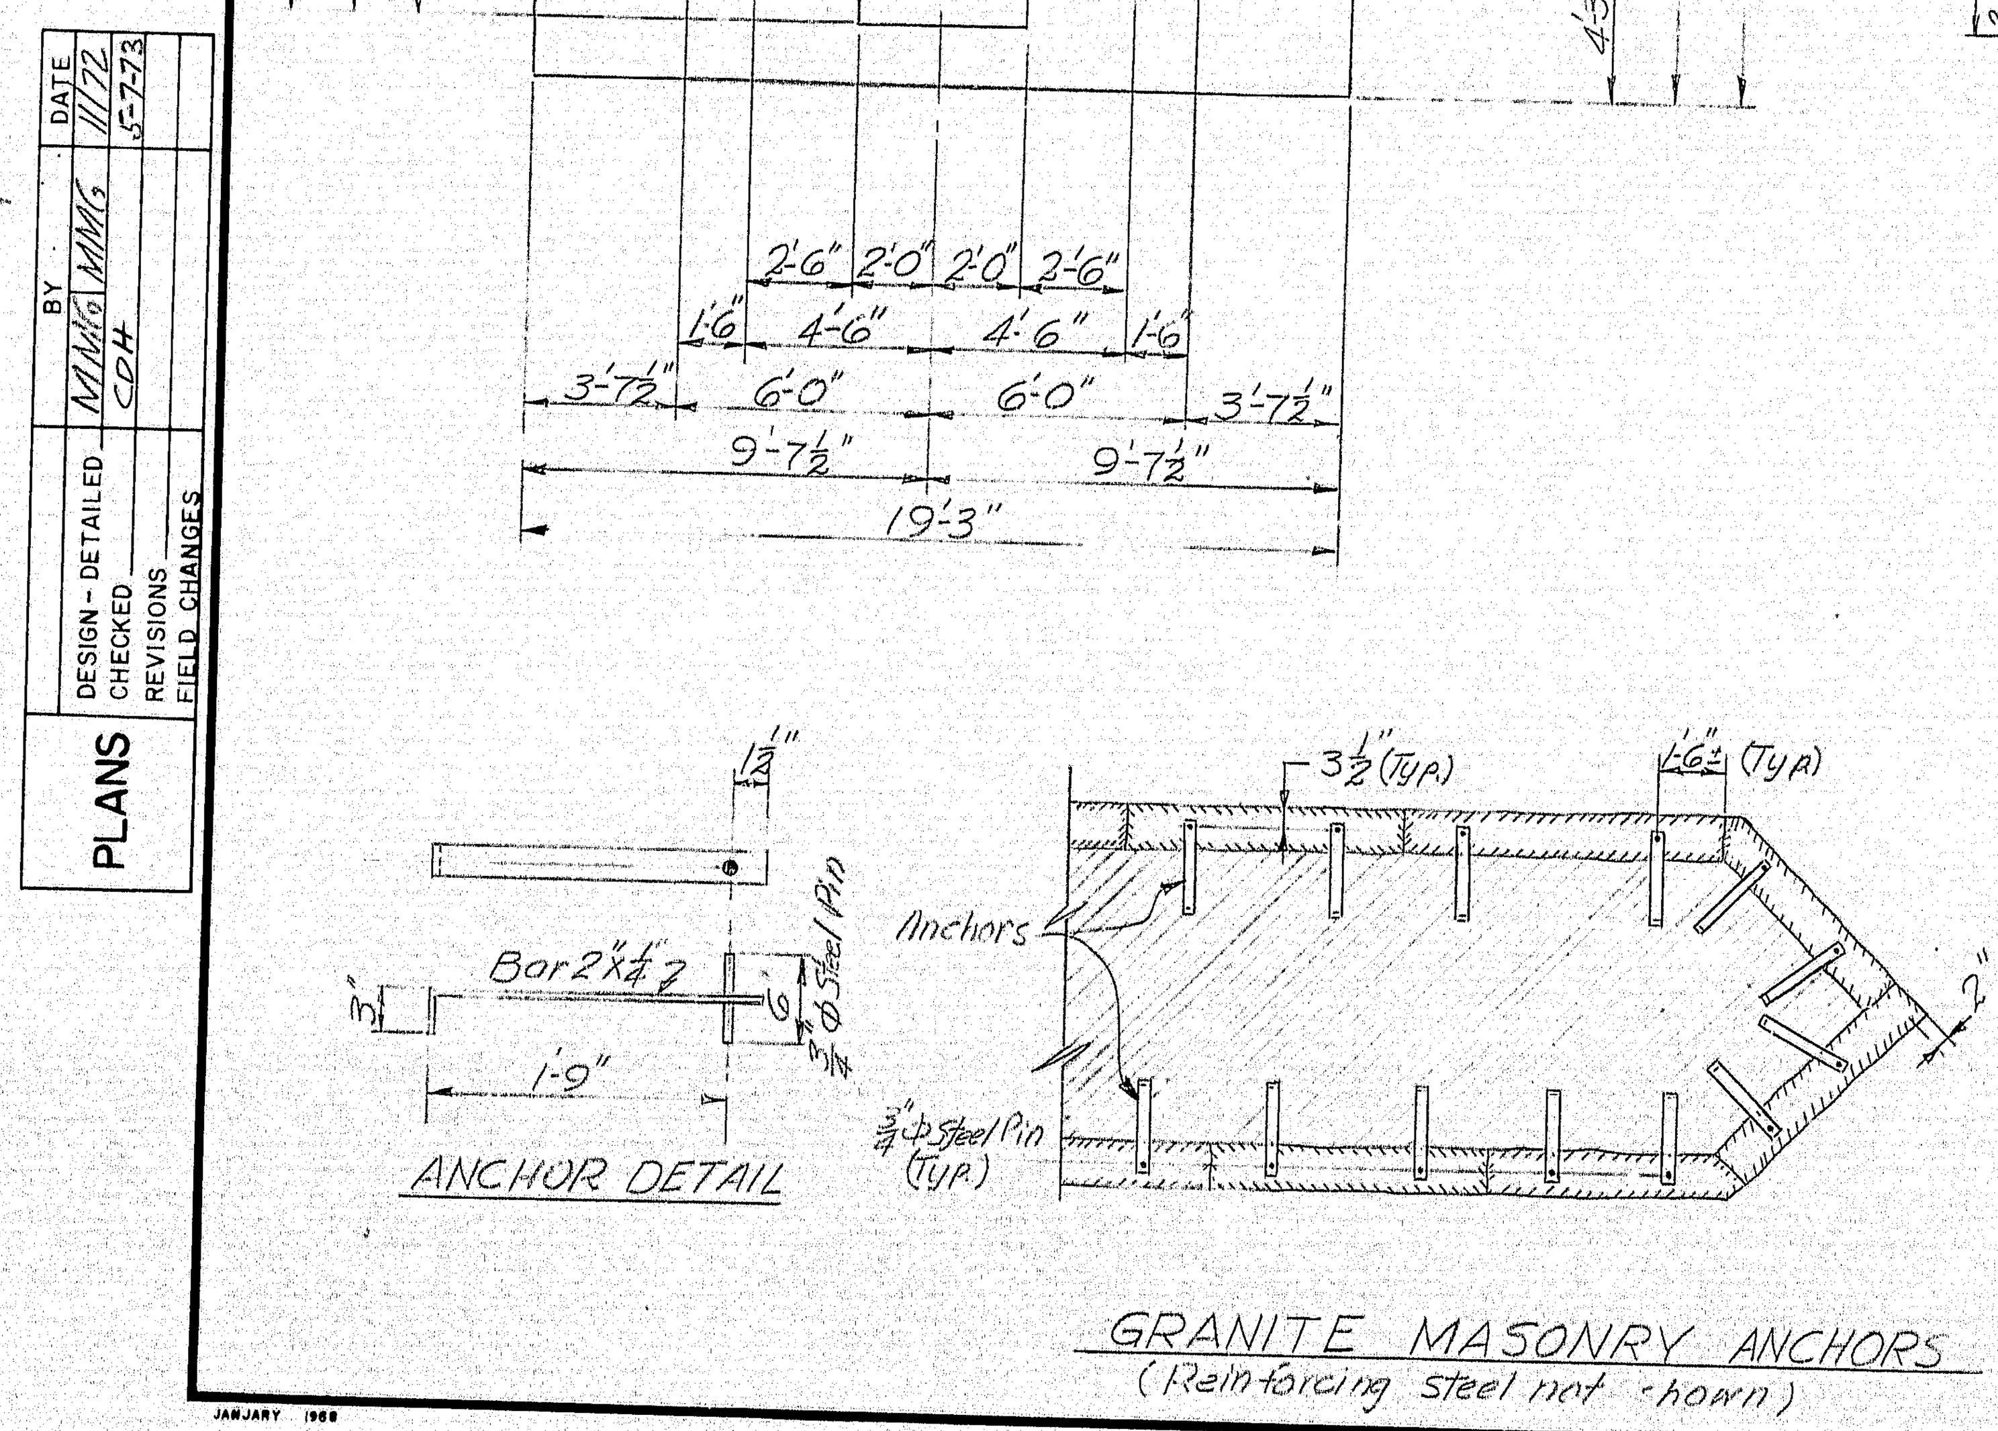
* Note:
Ledge shall be excavated in the area where seal are to be placed such that the average slope of the ledge will be not more than 4 feet vertical to 20 feet horizontal. Measurement and payment will be according to section 206 of the Standard Specifications except the depth measured for payment shall not extend below a horizontal plane thru the lowest point of existing ledge inside the neat lines of the seal. Typical for both piers.

It was not necessary to excavate any ledge. ARC

* Added March 22, 1973



GENERAL PIER NOTES

1- ~~Chamfer~~ chamfered all exposed edges of concrete ½ inch unless otherwise indicated

2- Reinforcing steel shall have 2 inches minimum cover above elev 10.0 and 4" min cover below elev 10.0

3- Place reinforcing steel in bridge seats to clear anchor bolts.

4- All reinforcing steel splices and embedments shall be a minimum of 36 bar diameters unless otherwise indicated.

5- The method of placing dowels in the concrete seal shall be approved by the Engineer.

6- Maximum calculated footing pressure = 6.2 Tons per square foot.

7- Seal concrete dimensions are predicated on use of MP-116, DP-2, I-27 or equivalent steel sheet piling with appropriate standard rolled corners. Pay dimensions for seal concrete shall be to the neat lines shown plus five inches all around.

8- The top of seal elevations have been set assuming a pumped head from El. 6.0 to the top of the seal and considering only the buoyant weight of the concrete seal. If the average ledge elevation is above than -33.0 at Pier #1 & -21.0 at Pier #2, the seal depth must be re-designed. The cofferdoms ~~shall be~~ were vented at El. 6.0.

9- Provide a minimum of two anchors per stone in Granite Masonry. Payment for anchors will be considered incidental to Item 525.06. Adjust granite masonry anchors to clear shaft reinforcing steel, where necessary.

10- Intermediate concrete construction joints ~~shall be~~ were at least 6" from horizontal granite joints and shear blocks ~~shall be~~ were provided.

DESIGN CRITERIA

Critical AASHO Loading ------ Group IX
Buoyancy ------ Water Level assumed at El. 4.7
Stream Flow ----- Velocity of 4 Ft. per second skewed at 10° to longitudinal axis of pier.
Wind --------- 41 psf Transverse; 12 psf Longitudinal.
Ice ----------- 6 Inches thick, producing 200 psi. Ice skewed at 10° to longitudinal center line of pier, with water Elev. at 4.7.

FABRICATION NOTES

1. No transverse butt weld splices will be allowed in the flange plates or web plates within 10 feet from the points of maximum negative moment at pier or maximum positive moment. (See sh# 13.

2. Sections of flange plates or web plates between transverse butt weld splices or from field splices shall be not less than 10 feet in length unless otherwise shown on the plans.

3. Butt weld splices in flanges shall be not closer than one foot from transverse welds in the web plates.

4. One longitudinal butt weld splice in the web will be allowed in the haunched sections of the girders. Feather edges between the longitudinal welds and the bottom flanges will not be allowed.

5. Bearing stiffeners shall be plumb after erection and dead loading of the structure. Intermediate web stiffeners may be either plumb or normal to the top flange.

6. Crossframe connection plates may be either plumb or normal to the top flange.

7. Filler plates may be ASTM A36 steel and mill tests for filler plate material will not be required.

8. Intermediate stiffeners and crossframe connection plates shall extend to the top and bottom flanges, and shall have a "paint tight fit", except intermediate stiffeners adjacent to abutments (6 per beam section) shall be attached to the top flange with a 5/16" double fillet weld; and intermediate stiffeners adjacent to piers (15 each side of each pier) shall be attached to the bottom flange with a 5/16" double fillet weld.

9. Bearing stiffeners shall be attached to both sides of webs at all abutments and piers, and shall have a "paint tight fit" at the top flange and shall be ground to bear at the bottom flange or attached with a full penetration groove weld.

10. At the contractor's option additional bolted field splices may be utilized at locations shown on the plans. Design details will be provided upon written request by the contractor.

11. All structual steel except as otherwise indicated shall conform to ASTM A36. Girder flange plates shall conform to ASTM A572 Gr 50 where shown on framing plan. Bolts shall conform to ASTM A325.

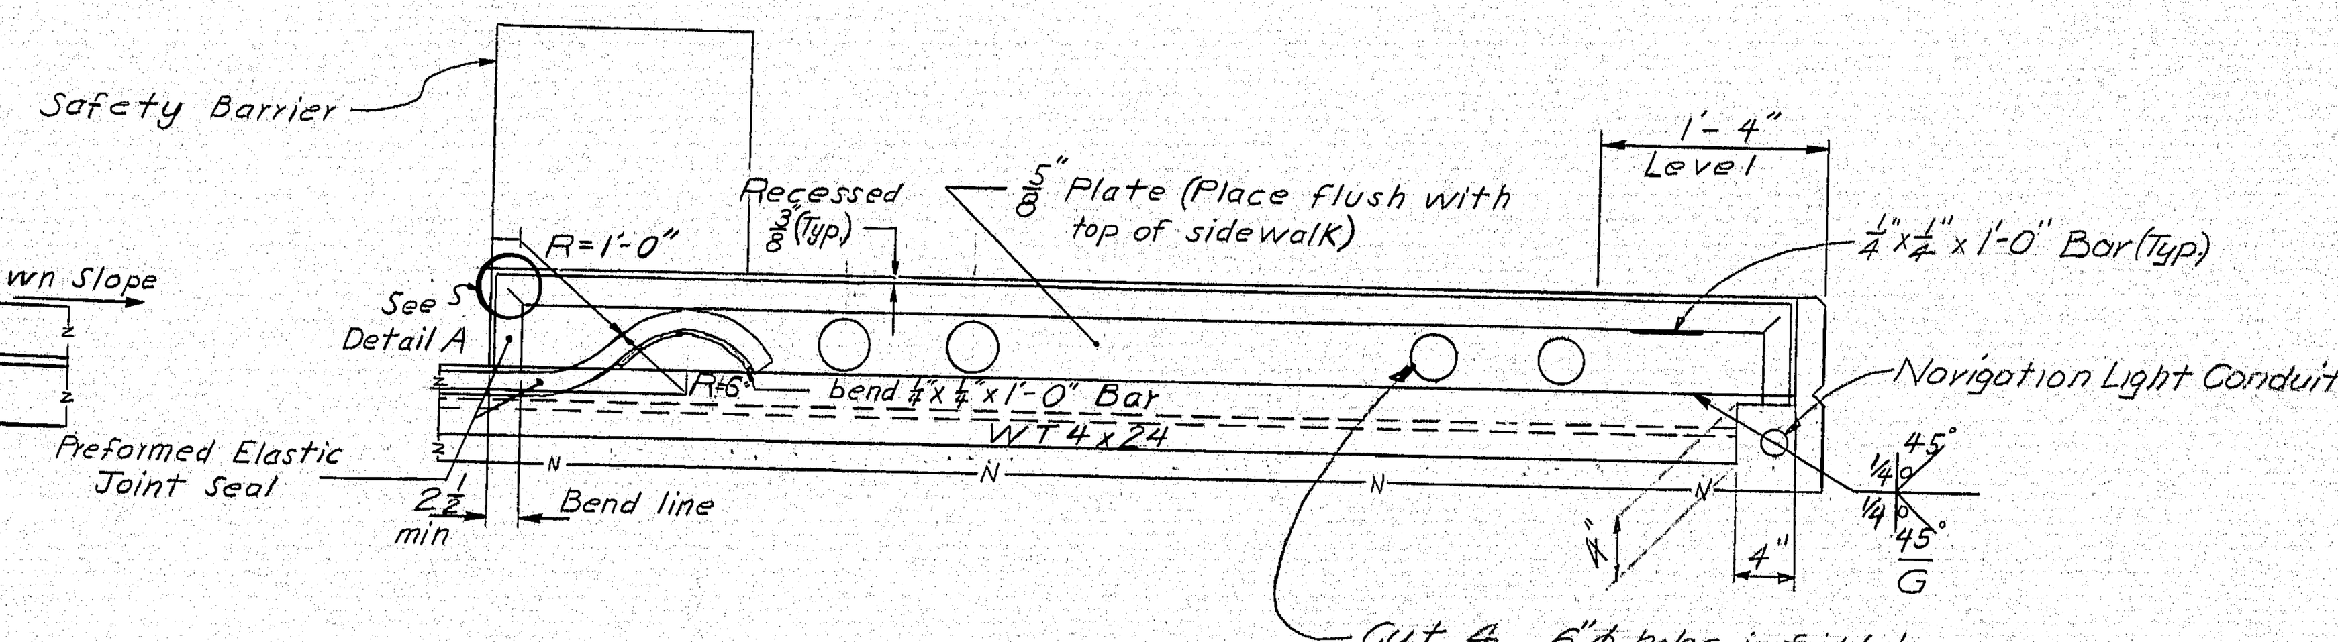
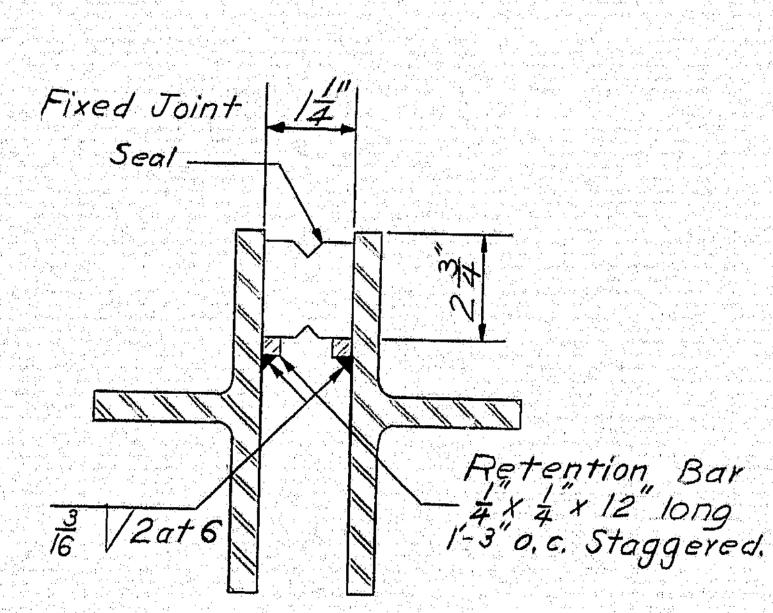
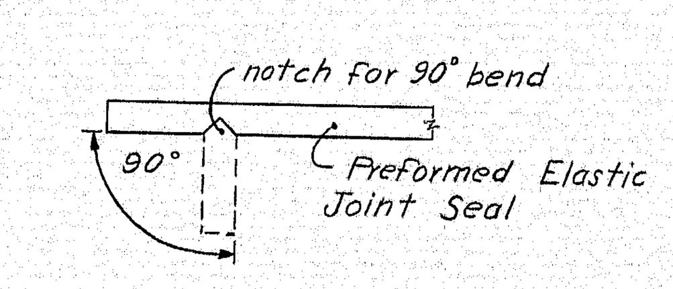
SECTION C-C



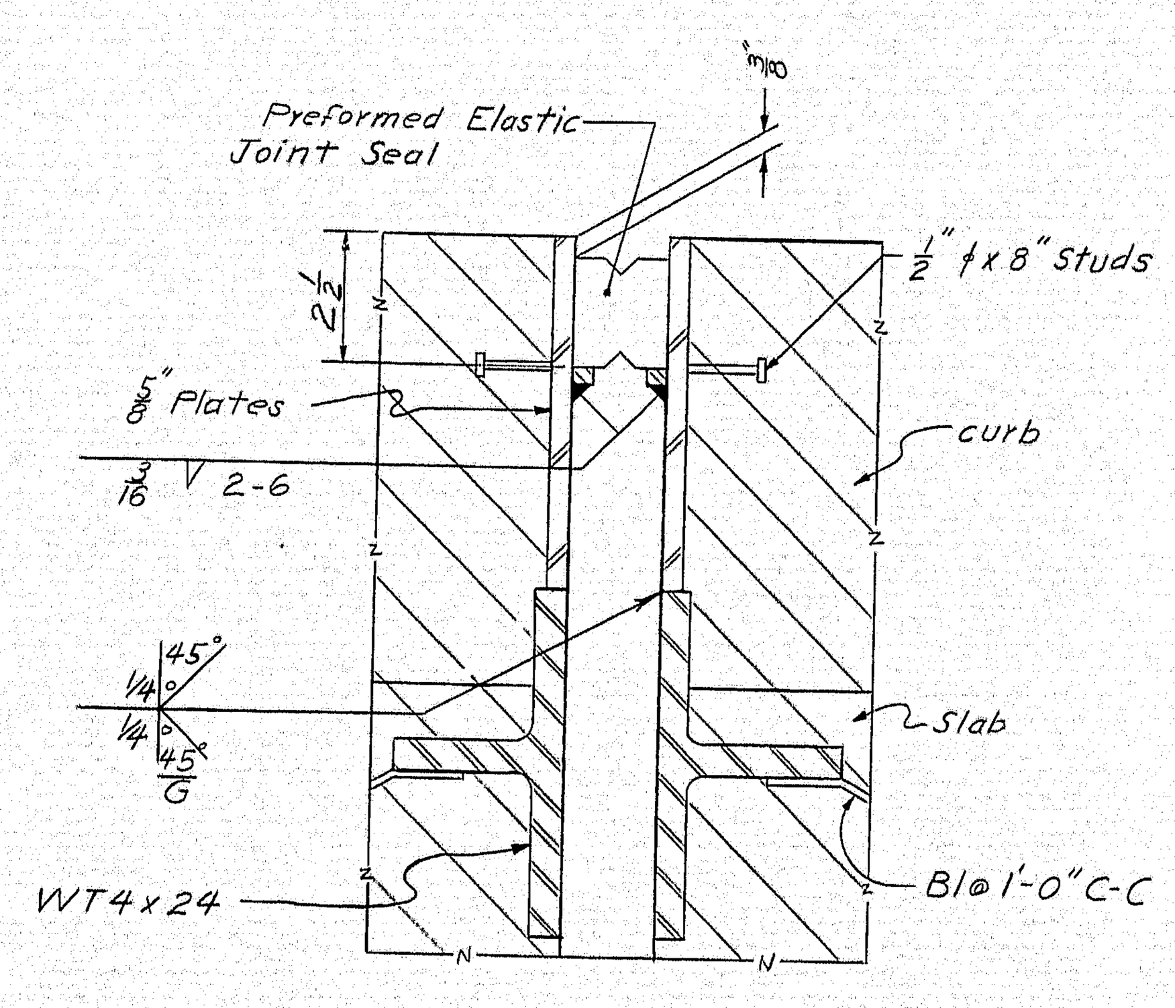
SECTION D-D



SEAL ARRANGEMENT



DETAIL A



SECTION B-B

NOTES:

1) The seal furnished shall be type A or type B and shall have a movement rating of 1/2 inch.

2) The joint opening shown, is for design only and is subject to change due to differences in seals as supplied by various manufactures. Do not use for setting of joint opening during construction.

3) The seal characteristics shall be submitted to the engineer for approval, prior to the fabrication of the armored joint.

4) A movement of 1/2 inch, due to dead loads (slab, curb, and wearing surface), shall be taken into account when setting the armored joint.

NOTE:

For armored joint details not shown, refer to Bridge Standard Details BD 104-71.

BLOCKING PLAN

① Superimposed Dead Load Deflection
② Steel Dead Load Deflection
③ Fluid Dead Load Deflection

For Blocking Detail see sheet 16 of 25

Note:
Bottom of slab elevations have been adjusted to compensate for concrete dead load deflections (fluid and superimposed). Use in conformance with subsection 502.10 (a) of the specifications.

SUPERSTRUCTURE NOTES

1. ~~Chamfer~~ Chamfered all exposed edges of concrete 1/2" unless otherwise indicated.
2. Formed a 1" V-groove on the outside faces of each contraction joint in the curbs, at each construction joint in the slab, and at the horizontal joint between the curb and slab.
3. Broke the bond in contraction joints in the concrete curbs by a method approved by the Engineer. Did not break the bond in construction joints in the superstructure slab.
4. Provided joints in the Vertical Bridge Curb Type 1, at each contraction joint in the concrete curb.
5. Reinforcing steel had a minimum cover of 2 inches unless otherwise indicated.
6. Reinforcing steel splices were a minimum of 36 bar diameters unless otherwise indicated.
7. Placed 1 inch diameter plastic tube drains at 10 foot intervals along the curb at both sides of the superstructure, and as described in Subsection 502.17.
8. Protective Coating for Concrete Surfaces was applied to the following areas: top of concrete curb & sidewalks; Fascia to drip notch under slab; and End of concrete slab at Abutment No. 2, to drip notch under slab, safety barrier.
9. Mortar for bedding and for joints in the granite curb contained an approved non-shrink additive.
10. Panel placement was used to construct the superstructure slab. Panels were placed in the ascending numerical order indicated on the Panel Placement Diagram. (See Sheet No. 19. A minimum of 5 days shall elapse between placement of panels marked ① and ② and between panels marked ② and ③

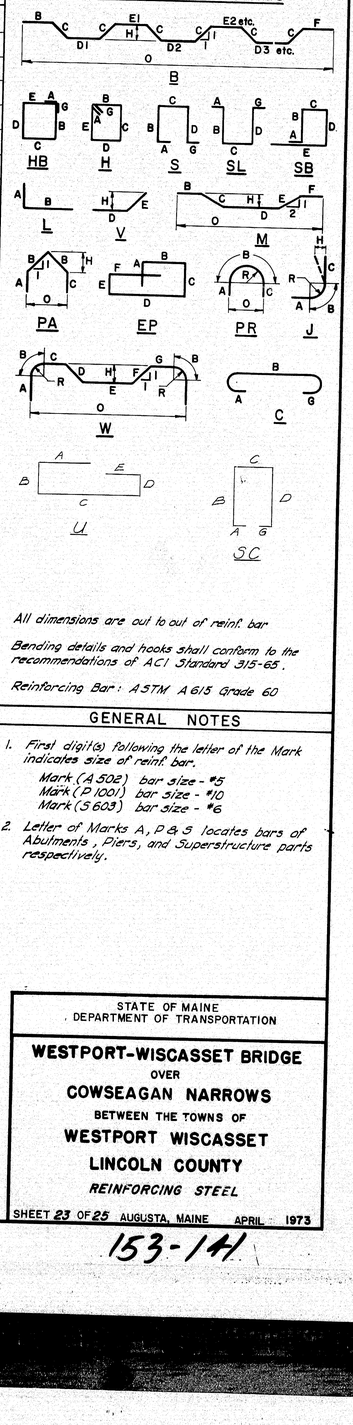
TYPE-BENDING DIAGRAMS



All dimensions are out to out of reinf. bar.

Bending details and hooks shall conform to the recommendations of ACI Standard 315-65.

Reinforcing Bar: ASTM A615 Grade 60

GENERAL NOTES

1. First digit(s) following the letter of the Mark indicates size of reinf. bar.
   Mark (A502) bar size - #5
   Mark (P1001) bar size - #10
   Mark (S603) bar size - #6
2. Letter of Marks A, P & S locates bars of Abutments, Piers, and Superstructure parts respectively.

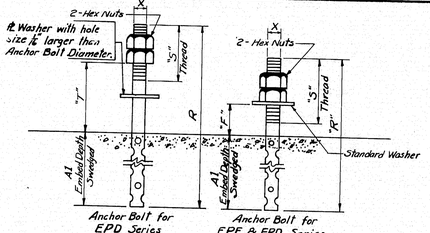
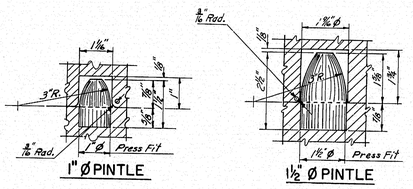
ANCHOR BOLT DETAILS



PINTLE DETAILS



NOTE:
Use 1"Ø Pintles with 1"Ø Anchor Bolts & 1½"Ø Pintles with 1½"Ø Anchor Bolts.

GENERAL NOTES:

At the location of bearing pedestals the concrete bridge seats shall be dressed one inch larger all around than size of masonry plates and to exact elevations shown on the plans. If dressed areas are below the surface of the surrounding bridge seat a small channel shall be cut to the edge of the bridge seat for drainage where required by the Engineer. Channels shall have a min. width of 2", and a min. slope of ¼ inch per foot. No separate payment for this work will be made as it shall be considered incidental to contract items.

Fabricate pedestals with ¼" fillet welds. The diameter of the pin hole shall not exceed that of the pin by more than ⅛ inch.

Pedestals EPD-1 thru EPD-9 and EPE-1 thru EPE-10 have no center stiffeners and have only one drainage hole.

Pedestals EPD-10 and EPE-11 thru EPE-17 have a center stiffener and have two drainage holes.

Pedestals FPD-1 thru FPD-3 have no center stiffeners and have no drainage holes.

Pedestals FPD-4 thru FPD-6 have a center stiffener and no drainage holes.

DESIGN SPECIFICATIONS

A.A.S.H.O., Standard Specifications for Highway Bridges, 1969

A.S.T.M. STEEL CLASSIFICATION

All structural steel shall be - A36 except the following:

2"Ø Pin - A36; A235, Class E or A108, Grade 1016 - 1030 inclusive.

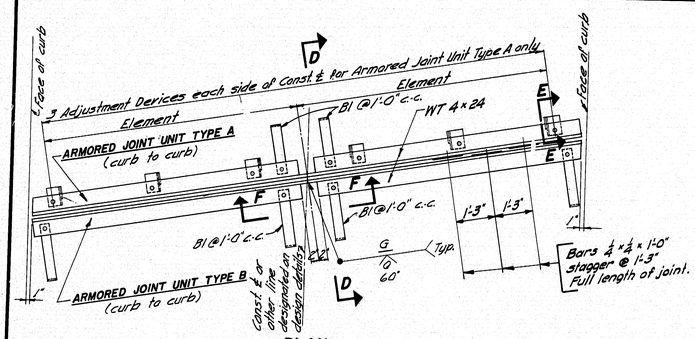
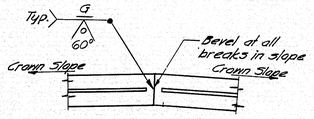
DRAIN NO. 1

DIAPHRAGMS



PLAN

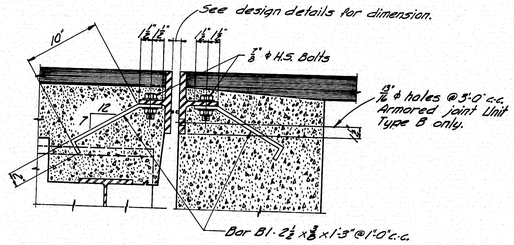


SECTION F-F
Note: See design details for Const. ℄ to curb dimensions, skew, crown slope, slab thickness, other dimensions necessary to complete the fabrication details, and location.

NOTE

1. Type A Armored Joint Units are intended to be used for attachment to superstructures. Type B Armored Joint Units are intended to be used for attachment to abutments. At armored joints over piers, two (2) Type A Armored Joint Units shall be used.
2. If more elements than the two shown in the 'Plan' are required by the design details, there shall be three adjustment devices for each element for Armored Joint Unit Type A and the elements of both units shall be field welded together in the same manner as shown in the 'Plan'.
3. Armored Joints to be paid for as Structural Steel.

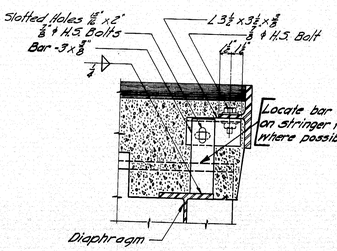
ARMORED JOINT
An armored joint consists of two armored joint units. See note 1.



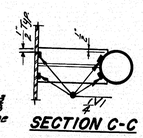
ARMORED JOINT UNIT TYPE A

ARMORED JOINT UNIT TYPE B

SECTION D-D

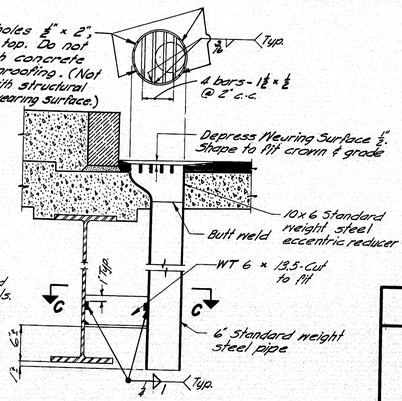


SECTION E-E
Showing Adjustment Device Armored Joint Unit Type A only - After Unit is in final position weld ⅜ bar to angle with ¼ Fillet

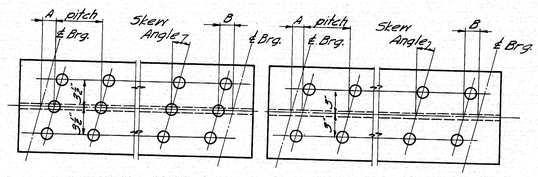


SECTION C-C

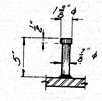
NOTE
1. Drain may be rotated 180°. See design details.
2. See design details for location and number of drains and beam size to which it is connected.



DRAIN NO. 2



TRIPLE STUDS **DOUBLE STUDS**



STUD DETAIL

NOTE
1. Studs shall be granular or solid flux filled and automatically end welded to top flange in the shop or field.
2. See the design details for Dimensions 'A' & 'B', stud pitch and skew angle for studs.

SHEAR CONNECTORS

GENERAL NOTE
Use only those items called for on design details. In case of conflict between these Standard Details and the design details, the requirements of the design details shall be followed.
Drains to be incidental, see Section 502.20

MATERIALS

Diaphragms, Crossframes and All Plates (Filler, gusset, and connection) ASTM A36

High Strength Bolts 7/8" diameter ASTM A325

FABRICATION NOTES

1. For location and type of diaphragm or crossframe see design details.
2. Holes for ⅞" diameter bolts shall be 15/16" dia. and Edge distances shall be 1¼" minimum unless otherwise shown.
3. Connection plates and gusset plates shall have a minimum thickness of ⅜" and shall have sufficient width to provide erection clearances. When bearing stiffeners or intermediate stiffeners are used as connection plates, the plate size will be given on the design details.
4. Connection plates shall be fastened to beam and girder webs as follows:
   - 0° to 30° skew — fillet weld both sides.
   - Over 30° skew — full penetration groove weld (See Detail B) except as indicated in Note 5
   - Over 45° skew — weld prequalification will be required.

   The skew angle is the angle between the connection plate and a line normal to the beam.
5. Bearing stiffeners shall be used as connection plates when the skew is not over 30°. When the skew is over 30° a bent connection plate shall be attached to the web adjacent to the bearing stiff. as shown in Detail A.
6. All fillet weld sizes shall be the minimum for the thickness of metal being joined according to AWS Specifications for Welded Highway & Railway Bridges.
7. Connection plates on welded beams and girders shall extend to the top flange in areas where the top flange is always in compression or when used as a bearing stiffener or intermediate stiff.
8. Connection plates shall extend to the bottom flange when used as a bearing stiffener, at points where lateral bracing is attached & on welded beams and girders in areas where the bottom flange is always in compression.
9. When a conn. plate is extended to a flange it shall be a paint tight fit except as otherwise indicated on design details.
10. Conn. plates shall be 2⅜" clear from flanges, except as indicated by Notes 7&8.
11. Use only those items called for on the design details. In case of conflict between these standard details and the design details, the design details shall be followed.

PIER REPAIR NOTES:

1.- The Construction Engineer and Divers from the Department shall be ferried from shore (Wiscasset Public Landing) to the site upon request. This item shall be considered incidental to Item 659.10, Mobilization.

2.- All work, materials and payment involved in the underwater pier repair shall conform to Special Provision Section 502, Structural Concrete (Underwater Grout Bags).

3.- Disturbance to the seabed shall be limited to installation of Underwater Grout Bags. No dredging or dumping of material is authorized.

4.- Barges and boats shall be moored to the seabed independent of the existing bridge structure under Span #1.

5.- Item 629.06, Diver/Hand Labor shall cover unanticipated work activities authorized by the Construction Manager that are not part of the placement of Underwater Grout Bags.

6.- Travel by marine vessels in and out of the bridge channel shall not be impeded by construction activities. Barges shall be marked with lights at night as an aid to navigation. Signs shall be provided on barges in the bridge channel notifying marine traffic of construction activities above and below the water. These items shall be considered incidental to Item 659.10, Mobilization.

7.- Unstable material along the bottom of the undermined area shall be removed prior to grouting the bags. All bags are to be placed on ledge.

8.- All vent/fill tubes shall be spaced at no more than 2 m and shall be field cut to length. The length shall be to the back of the void and no more than the outer edge of the grout bags.

9.- All vent/fill tube connections shall be threaded or other attachment approved by the Construction Manager.

9.- Grout bags shall not be tied together with reinforcing steel or by any other means. Grout bags shall be allowed to settle to a state of equalibrium individually to fit the contours of the ledge and concrete pier seal.

10.- The grout bags shall be overlapped both horizontally and vertically to prevent any gaps between the bags. The grout bags act as a stay-in-place form.

PIER REPAIR NOTES CONT.

11.- A liquid anti-washout admixture, such as RHEOMAC UW 450 or an equal product shall be added to the concrete on site as per manufacturer's recommendations. Any remaining product after the grouting operation is complete shall become the property of the Department. Bridge Maintenance Office in Augusta shall be notified to pick up the remaining product.

12.- The grout bags shall not be filled more than 300 mm average thick except the top bag which can be greater to ensure a good seal.

13.- After the grout bags and vent/fill tubes are installed, The void shall be pressure filled by starting at the lowest end and continuing around the pier. The grout shall be pumped at each vent/fill tube until it exits from the adjacent one. Rags or other flexible material shall be used to plug the vent/fill tubes after pumping operation is complete.

14.- An Underwater Inspection Report is available for the Contractors reference at the Bridge Maintenance Office in Augusta.
