Final Design Report, Hydrology/Hydraulics  
Cumberland Mills Bridges over Presumpscot River in Westbrook, ME.

## 1.0 Introduction:

The Cumberland Mills Twin Bridges carry Cumberland Street over the Presumpscot River in Westbrook, just upstream of the Sappi Mill dams. The two bridges span two river channels divided by an island and are single span bridges on granite block abutments. The bridges are set for replacement. Note that project datum is NAVD 1988. NAVD 1988 = NGVD 1929 – 0.67' for this location.

## 2.0 River Environment:

The Cumberland Mills Bridges are about 300' upstream of the Sappi Mill dams. The dams were recently evaluated for fish passage through consideration of dam removal. Following evaluation of impacts of dam removal, Sappi chose to construct a fish passage structure on one of the dams. In studies and plans for fish passage, the two channels are known as the “freshet” channel (on the left when facing downstream) and the “main” channel (on the right when facing downstream). River flow is divided downstream of the dams as it passes under and through mill structures. The two dam structures can be seen in the air photo following. The freshet dam is orange and the main dam is shown in blue. Flow is to top of photo, and twin bridges are at bottom of photo.

The river channel merges above the dams and splits again at the bridges where the channels pass by an island. The channels merge upstream of the bridge and bend around from the west.

The flow environment at the bridges is influenced by:

- Flow through the bridge structures
- Backwater from the two dams
- Under high flows, backwater from the mill buildings and channels below the dams

The flow environment will be modified due to:

- Reconstruction of the bridges
- Addition of the fishway to the freshet channel
- Changes in the spillway/flashboards on the freshet channel dam due to fishway addition

### 3.0 Review of Existing Data:

Existing data related to the bridges was reviewed including:

- FEMA 1980 Flood Insurance Study (Effective study as of January 2011). FEMA did not model the buildings or the dam in their flood profile. FEMA used the following flow distribution (cfs), and flood elevations upstream of the Cumberland Mills Bridges: (1929 NGVD)

|    |        |        |      |
|----|--------|--------|------|
| a. | 10-yr  | 8,500  | 44.9 |
| b. | 50-yr  | 11,800 | 45.5 |
| c. | 100-yr | 13,300 | 46.5 |

d. 500-yr 17,000

46.9

- Preliminary Data for FEMA MAPMOD update program. USGS has recently redone the hydraulic model in this area. The model was furnished by USGS. Because the USGS model was designed to map the City of Westbrook, limited geometric data was obtained for the Sappi buildings, the channels below them, the dams and the twin bridges. The new model does use the same flow distribution as used for this study, and downstream elevations used for that model were evaluated for use as boundary conditions for the HECRAS model for the Bridge PDR study. Model results from the USGS model (assumed NAVD) are summarized below:

| Flood Frequency | US Sappi Bridge | US dams | US Cumberland Mills BR |
|-----------------|-----------------|---------|------------------------|
| 1996            | 44.8            | 52.3    | 52.6                   |
| 50-year         | 41.1            | 50.1    | 50.0                   |
| 100-year        | 42.4            | 51.0    | 50.9                   |
| 500-year        | 45.7            | 53.3    | 53.9                   |

- USGS Gage Data at Sappi Bridge downstream of Mill. Gage No. 01064118 Presumpscot River at Westbrook.  
From 1976 to present, USGS reported measured gage height. From 1976 to 1997, flow rate was also reported. The gage datum is 13.42' above NGVD 1929 and the river drains 577 square miles at this location, including Sebago Lake.
- USGS Regional Formula for Peak Flow: Estimating the Magnitude and Frequency of Peak Flows for Streams in Maine for Selected Recurrence Intervals. Based on this report and on MDOT recommendations, the following flow-frequency distribution was adopted for this project.

|            |            |
|------------|------------|
| 1.1-yr:    | 2,450 cfs  |
| 1916/1954: | 12,400 cfs |
| 25-yr      | 13,000 cfs |
| 50-yr      | 15,700 cfs |
| 100-yr     | 18,900 cfs |
| 1996:      | 23,300 cfs |
| 500-yr:    | 28,000 cfs |

- Sappi Dam Removal and Fishway Studies:
  - Kleinshmidt worked with Sappi to determine potential effects of dam removal. Dam removal was investigated as a means to address fish passage issues. Kleinshmidt Associates did extensive and detailed survey and modeling through the Sappi buildings for the dam removal study. This study was focused on low flows, but also found that under high flow conditions, the dam became completely submerged. The frequency of flow for the submerged condition was not determined, but was found to occur at high flows. The Kleinshmidt model was obtained through Sappi. This data was purchased by MDOT rather than resurvey the Sappi property (which would have required draining the

Sappi head-pond, and shutting down the mill since Sappi's water supply is from the pond) in addition to considerable time and expense.

- o Following evaluation of dam removal potential effects, Sappi evaluated and designed a fishway to meet fish passage requirements, rather than dam removal. Acheron Engineering of Newport, Maine prepared the design for the new fishway. Sappi provided Acheron's design drawings for the fishway and discussions were held with Acheron Engineering to clarify spillway operation.

- **Historical Flood Data:**

Data on historical flooding was obtained from USGS in a report titled Flood of October 1996 in Southern Maine. In addition, flood data from the USGS gaging station in Westbrook was used. The following table summarized known flood elevations and flows for this reach of river in order of magnitude.

| Year | Flow   | At Gage (DS of mill) |      | At Dam/DS bridges |      | US of Bridges |      |
|------|--------|----------------------|------|-------------------|------|---------------|------|
|      |        | NGVD                 | NAVD | NGVD              | NAVD | NGVD          | NAVD |
| 1987 | 7,360  |                      |      |                   |      |               |      |
| 1916 | 12,400 |                      |      | 46.0              | 45.3 |               |      |
| 1954 | 12,400 |                      |      | 45.8              | 45.1 |               |      |
| 1977 | 12,500 |                      |      |                   |      |               |      |
| 2007 | 13,300 |                      | 38.0 |                   |      |               |      |
| 1991 | 13,900 |                      | 38.9 |                   |      |               |      |
| 1996 | 23,300 |                      | 47.5 | 51.6              | 50.9 | 52.5          | 51.8 |

Sappi furnished numerous photos of flooding conditions at and around the Sappi mill dams and buildings. Note that these photographs are copyrighted by Sappi. Examples of these photos follow:

April, 2005. Flow into freshet channel. Note flow over finger-wall walkway. (Sappi photo)

April, 2005. Flow from main channel dam under Sappi building. Other flood photos show water at or above the elevation of the base of the building. (Sappi photo)

April, 2005. This photo shows water in the walkway between the buildings. Other photos show actual flow occurring through this section. (Sappi photo)

This photo shows the site in aerial view during the 1996 flood and is from a report on that flood. Although this photograph was not taken at the peak of this flood, note flow through building in center of photo and note that main channel dam is submerged.

The photos furnished by Sappi were used to fine tune the HECRAS model for high flows to assure that all areas through which flow occurs were included in the model.

#### **4.0 Hydrologic Analysis.**

The flood flow frequency distribution for this bridge design study is based on the data at the USGS gaging station on Presumpscot River just downstream of Sappi Mill. MDOT also recommended use of these flows.

| Frequency | Flow, cfs |
|-----------|-----------|
| 1.1-yr    | 2,450     |
| 2-yr      | 5,310     |
| 10-yr     | 9,890     |
| 25-yr     | 13,000    |
| 50-yr     | 15,700    |
| 100-yr    | 18,900    |
| 500-yr    | 28,000    |

Historical Flows at this gaging station are summarized below:

| Year       | Flow, cfs |
|------------|-----------|
| 1991       | 13,900    |
| 1996       | 23,300    |
| 1896       | 13,800    |
| 1895       | 13,000    |
| 1954, 1916 | 12,400    |
| 1900       | 11,300    |
| 1936, 1977 | 11,200    |

#### Summary of Hydrologic Data:

|                                       |        |
|---------------------------------------|--------|
| Drainage Area, sq. mi.                | 577    |
| 25-year Discharge, cfs (Q25)          | 13,000 |
| Design Discharge, cfs (Q50)           | 15,700 |
| Check Discharge, cfs (Q100)           | 18,900 |
| Scour Check Discharge, cfs (Q500)     | 28,000 |
| Ordinary Annual Discharge, cfs (Q1.1) | 2,450  |
| Flood of Record (1996)                | 23,300 |

## 5.0 Hydraulic Analysis:

The Cumberland Mills Bridges will be replaced. Existing openings are 77' at the freshet channel and 90' at the main channel. Existing low chords on the freshet side are 49.5' and 49.6' (L/R). Existing low chords on the main channel are 47.5' left and 47.0' right.

Proposed bridges will be slightly lengthened. The new spans will be 82' on the freshet side and 100' at the main channel. Proposed low chord will range from 49.9' to 50.5' on the freshet side and from 49.0' to 49.5' on the main channel side.

Flow elevations at the twin bridges are controlled by downstream conditions at the Sappi dams and in very high flows by the Sappi buildings and conditions downstream of the buildings. Under existing conditions, both dams have flashboards that are designed to fail under high flow conditions. Based on historic flood and repair photos furnished by Sappi, the exact amount of failure (if any) cannot be predicted. To be conservative, it was assumed that under existing conditions, the flashboards remain upright and in-place. It was also assumed that the dam gates remain closed because flooding can occur at any time of the day, flooding may limit access, and the gates require some manual operation.

The Sappi dam that discharges to the freshet channel will be modified when the fishway is constructed. The flashboards on this dam will be replaced with an Obermeyer spillway with an automatic headpond elevation control system. According to Sappi's consultant for the fishway dam, the spillway will normally keep the headpond at a target elevation, and under high flow conditions, will decrease in height and therefore pass more flow than under existing conditions. Acheron summarized the new spillway function as follows:

*“Under “normal” flow conditions, defined at 300 to 4,500 +/- cfs, the sluice gates in the main channel spillway will remain closed, the flashboards on the main channel spillway will remain in place and the new Obermeyer gates on the freshet channel will move up and down as the flow changes so as to maintain a headpond elevation of approximately 41.5 ft (NGVD 1929) at all times. As the flow rate in the river declines (below 4,500 cfs), the position of the gates will be raised. As the flow rate in the river increases, the position of the gates will be adjusted automatically based on a water level monitoring system in the headpond. Once the flow rate in the river increases above 4,500 +/- cfs, all of the spillway gates will be in the full down position and the water level in the headpond will rise as water will be flowing over the flashboards on the main channel and through the fully open crest of the freshet channel spillway. The top of the Obermeyer gates in the fully lowered position is approximately 36.0 ft (NGVD 1927- ed. Note 1929). The future configuration of the freshet channel spillway (during high flows) will be similar to a situation that could exist today if all of the flashboards on the freshet channel spillway were completely removed.”*

The hydraulic model for the twin bridges was compiled using model HECRAS. The model includes data from the Kleinshmidt dam removal study, from the Acheron fishway project, and from the MDOT survey for the bridge project. In addition, photographs of historical floods at the mill were used to supplement model data and to accurately reflect the various paths that flood water takes through the Sappi buildings.

- o The Kleinshmidt model was used for the portion of the current HECRAS model downstream of the Sappi dam. Elevations were added to sections to reflect high flow conditions and several areas of the split dam were added to the model that experience overflow during high flows, such as the finger wall walkway, and the walkway between the buildings. These areas were identified through discussions with Sappi engineering and by studying flood photos from 1996, 1991, 2007 and 2010.
- o Information from the Acheron fishway plans was used for the proposed dam condition model.

- o The Sappi model (converted to NAVD), the Acheron fishway data (converted to NAVD) and the MDOT survey data (at NAVD) were used to compile one working model of existing conditions at the dam and at the bridges. Four geometry files were compiled by Northstar for Stantec, including
  - the existing dam/existing bridge model,
  - the existing dam, proposed bridge model,
  - the fishway/existing bridge model and
  - fishway/proposed bridge conditions.

The dams and downstream channels were modeled as split flow with the flow optimization routine in HECRAS assisting in balancing flows. The split flow reaches are the “freshet” reach (on left) and the “main” reach on the right (facing downstream). In the main reach, the buildings downstream of the dam were modeled as bridges as flood photos show water reaching the floor/low chord of the buildings. In the freshet reach, it does not appear that the buildings provide such “pressure” type of flow.

Boundary conditions downstream were based on data from the USGS gage. USGS was consulted relative to the gage and the rating curve used at the gage. USGS indicated that the rating curve may need to be updated, but data is not currently available. The proposed FEMA profile was considered as a source of boundary condition at the downstream end, but does not appear to reflect historical data at that location. Therefore the gage data was used as best available information. Model results indicate that the downstream starting water surface elevations only affect floods above 100-year frequency. Upstream boundary condition was assumed to be critical flow, although upstream is backwater so the “critical flow” assumption does not affect the model at the bridges, but allows it to run in “mixed flow” mode. The model was run as “mixed” flow meaning mix of sub- and super-critical.

The HECRAS model indicates that the dams submerge somewhat in lower flows, and completely submerge (meaning no significant drop in WSEL over the dam) in the 1996 type of flood event. The model indicates that up to about a 100-year event, the dam still has some drop in water surface elevation and so controls water surface. Water elevations in the downstream channels are above the crest of the flashboards.

Pictures show flow in 2007 and 2004 going over the fingerwall walkway into the channel by at least a foot, maybe 2’. The model spillways were configured to include that flow. In addition, the model accounts for flow that goes into the building walkway between the two channels, and assumes it flows into the freshet channel. These areas are modeled as straight-on not lateral spillways in the HECRAS model. The model assumes that the gates remain shut due to the need for manual operation and the uncertainty of this occurring during a high flow event. The model also assumes that the flashboards do not fail, even in high water. While this is a conservative assumption, historic flood photos show great variation in flashboard outcomes after flood events.

The following critical elevations were incorporated into the model:

**Key elevations: (known)**

|                                                       |                               |            |
|-------------------------------------------------------|-------------------------------|------------|
| Freshet dam crest (w boards)                          | 40.6 NGVD                     | 39.9 NAVD  |
| Freshet dam crest w fishway, Obermeyer gates lowered. | 36.0' NGVD                    | 35.3' NAVD |
| Main channel dam (w boards)                           | 41.5 NGVD                     | 40.8 NAVD  |
| Top of walkway into channel                           |                               | 43.0 NAVD  |
| Existing Bridges Low Chords                           |                               |            |
| Freshet:                                              | 49.5-49.6' NAVD, - width: 77' |            |
| Main:                                                 | 47.5-47.0' NAVD, - width: 90' |            |
| Proposed Bridges Low chords:                          |                               |            |
| Freshet:                                              | 49.9-50.5' NAVD, – width: 82' |            |
| Main:                                                 | 49-49.5' NAVD, – width: 100'  |            |

**Assumed/Estimated Elevations:** (based on photos of flooding)

|                                          |                                        |
|------------------------------------------|----------------------------------------|
| Walkway below central building           | Floor: 43.0', concrete wall 45.0' NAVD |
| Ceiling of building over walkway         | 51.0' NAVD                             |
| Building base over piers in main channel | 42.0' NAVD                             |

Data/model results for existing condition and model calibration are summarized in the following table. Calibration is not perfect. Unknowns remain and may not be able to be resolved, including exact nature of flow through buildings and channels and downstream water surface elevations at the USGS gage. HECRAS is limited in ability to model more complex flow, so the model appears to be adequately simulating flows for bridge design purposes. Engineering judgment based on historical flooding is necessarily included in interpreting the HECRAS model results for this bridge evaluation.

| Year | Flow  | Elevations           |      | At Dam/DS bridges | US of Bridges | Existing HECRAS  |              |

| Q100 | 18900 |                      | 42.8 |                   |               |                  | 47.2    47.7 |
| 1996 | 23300 |                      | 47.5 | 51.6              | 50.9          | 52.5    51.8     | 48.3    49.0 |
| Q500 | 28000 | 51.5                 | 50.8 |                   |               |                  | 52.1    53.1 |

For the 1916/1954 flow (just under 25 year), the model is 0.9 – 1.1’ too high. For the 1996 flood, the model is 2.6-2.8’ too low. The latter is likely due to starting elevation at the downstream end of the model.

#### Hydraulic Evaluation Summary:

|                                 | Existing Bridge | LC=47.4   | Proposed Bridge | LC = 49.0 |
|---------------------------------|-----------------|-----------|-----------------|-----------|
|                                 | Existing Dam    | w/Fishway | Existing Dam    | w/Fishway |
| Headwater at Q25, cfs           | 46.4            | 45.2      | 46.3            | 45.1      |

| Clearance at Q50                | 0.4             | 1.5       | 2.1             | 3.2       |

## 6.0 Scour

For preliminary design, scour was not computed in detail. Scour history, and apparent bedrock at base of foundations suggests little to no potential for scour at this site. Additional borings and geotechnical evaluations are being considered for final design. At this stage of design, it is expected that foundations will be on solid rock and that scour will not be a design consideration. If deep sequences of unconsolidated materials are found with additional geotechnical investigation, such that foundations will not be on rock, then potential scour will be computed for final design such that foundations can be designed to resist potential scour. According to Stantec, the existing abutment foundations pre-date the 1951 construction and have no known scour issues, despite a long history of flooding. Potential scour computations would be done with fishway gates down under high flow conditions.

## 7.0 Summary of Findings

- The Cumberland Mills Bridges are impacted by backwater from dams downstream at the Sappi Mill.
- The “freshet” dam will be reconfigured within two years to include a fishway and an Obermeyer spillway.
- The channels and buildings downstream of the dams also have some impact on backwater at the twin bridges.
- The 1980 Flood Insurance Study had limited data on the mill buildings and dam. The new draft model for an updated FIS also has limited data and modeling through the Sappi site.
- The USGS gaging station downstream of the mills was used for the flow-frequency distribution for this study. The gage has a record of just over 30 years of data. The gage rating curve may need to be updated, but has not been recently.
- Fish passage requirements below the bridges will be met by construction of a fishway, rather than through dam removal.

- Historic flows and flood elevations are available at or near this site, dating back to 1916.
- The 1996 flood was approximately a 250-year event, but may have been of higher frequency. Prior events included 5 floods that are just lower than the 25-year storm magnitude, including April of 2007.
- Flood photos show complex flow through the mills and over the various spillways during high flow events. Photos also show inconsistency in how many or where flashboards fail.
- The new spillway for the freshet channel/fishway will include an Obermeyer spillway designed to depress in high flows, such that flood elevations should be lower once this construction is complete.
- The HECRAS model simulated flood flows to within 1' of recorded events for 25-year type of storms but is somewhat low on predictions for the 1996 flood. It is likely that additional backwater from downstream causes the dam to be inundated by more than the current model shows.
- The proposed bridge spans will be slightly lengthened and freeboard will be added to improve clearance for the 50- and 100-year flood flows. Under existing conditions, 50-year clearance is 0.5'. By adding the fishway/spillway this clearance is improved to 1.6'. With the new bridge, existing dam, 50-year clearance is 2.1' and with the new fishway/spillway, clearance is expected to be 3.2' if the construction proceeds as shown on plans.
- Potential scour was computed roughly using model HECRAS, but it is most likely that foundations will be constructed on bedrock, with shapes nearly identical to existing. The bridge does have the potential to experience scour through contraction, abutment and pier scour if significant depths of unconsolidated material underlies the foundations.
- Despite the addition of the fishway lowering high flood levels, Stantec recommends maintaining the low chord for existing dam conditions. The fishway is not yet constructed and the mechanical flashboards may not always operate as planned during flood events. Therefore, the minimum low chord is proposed to be 49.0' (NAVD).
