* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

- Rh = Hybrid factor
- Rb = Load shedding factor (only applies to compression flange)
- Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr
- F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
- w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 5-8
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity

M+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 5-8
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
 flexure in which the web satisfies the requirement of LRFD
 Specifications Article 6.10.2.1.1

 Madawaska Critical Stringer MaineDOT Trucks 5-8
 SPECIAL #2 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
 input lateral loads have been entered.

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 5-8
 SPECIAL #2 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

 SPECIAL #2 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier
 (Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

Madawaska Critical Stringer MaineDOT Trucks 5-8
SPECIAL #2 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. F_r calculated using AASHTO Equation 6.10.8.2.3-1

B. F_r calculated using AASHTO Equation 6.10.8.2.3-2

C. F_r calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. M_r calculated using AASHTO Equation A6.3.3-1

E. M_r calculated using AASHTO Equation A6.3.3-2

F. M_r calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

$M_r(e)$ = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, F_r

$F+$ = $f_{bu} + (1/3)*f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If $F+$ prints as N/A, Appendix A calculations govern the LTB capacity

$M+$ = $M_u + (1/3)*f_l*S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If $M+$ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for $F+$ or $M+$ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress ($F+$) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress ($F+$) to the flexural resistance (F_r) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

 SPECIAL #3 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
 input lateral loads have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 5-8
 SPECIAL #3 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

SPECIAL #3 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. F_r calculated using AASHTO Equation 6.10.8.2.3-1

B. F_r calculated using AASHTO Equation 6.10.8.2.3-2

C. F_r calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. M_r calculated using AASHTO Equation A6.3.3-1

E. M_r calculated using AASHTO Equation A6.3.3-2

F. M_r calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

$M_r(e)$ = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, F_r

$F+$ = $f_{bu} + (1/3)*f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If $F+$ prints as N/A, Appendix A calculations govern the LTB capacity

$M+$ = $M_u + (1/3)*f_l*S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If $M+$ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for $F+$ or $M+$ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress ($F+$) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress ($F+$) to the flexural resistance (F_r) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

 SPECIAL #4 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
 input lateral loads have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

 SPECIAL #4 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier
 (Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

Madawaska Critical Stringer MaineDOT Trucks 5-8
SPECIAL #4 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. F_r calculated using AASHTO Equation 6.10.8.2.3-1

B. F_r calculated using AASHTO Equation 6.10.8.2.3-2

C. F_r calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. M_r calculated using AASHTO Equation A6.3.3-1

E. M_r calculated using AASHTO Equation A6.3.3-2

F. M_r calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

$M_r(e)$ = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, F_r

$F+$ = $f_{bu} + (1/3)*f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If $F+$ prints as N/A, Appendix A calculations govern the LTB capacity

$M+$ = $M_u + (1/3)*f_l*S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If $M+$ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for $F+$ or $M+$ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress ($F+$) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress ($F+$) to the flexural resistance (F_r) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

BRIDGE LOAD RATINGS W/O FWS (cont.)

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS

S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer MainedOT Trucks 5-8
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange

(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer HL-93 Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to

wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

** Legend of Resistance Calculation:

Compact Section:

A. $D_p \leq 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-1

B. $D_p > 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-2

C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)

E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)

F. Discretely braced tension flange governs (App A 6.1.2)

G. Continuously braced compression flange governs (App A 6.1.3)

H. Continuously braced tension flange governs (App A 6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange

(Article A6.2.1 or A6.2.2)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer HL-93 Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

Maximum Factored Shear Resistance (kips) 98.14
 Location (ft) 1.00R

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

			SERV-IIB	POS.	0.0	N/A	0.0	0.0	0.0	0.0	0.0	0.0

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to

wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

** Legend of Resistance Calculation:

Compact Section:

A. $D_p \leq 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-1

B. $D_p > 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-2

C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)

E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)

F. Discretely braced tension flange governs (App A 6.1.2)

G. Continuously braced compression flange governs (App A 6.1.3)

H. Continuously braced tension flange governs (App A 6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer CL-625-ONT Truck Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)
SHEAR CAPACITY
BEARING STIFFENER CHECK
DEFLECTION LIMITS FOR LIVE LOAD
RATING FACTORS - STRESS FLEXURAL CAPACITY

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer CL-625-ONT Truck Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to

wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

** Legend of Resistance Calculation:

Compact Section:

A. Dp <= 0.1*Dt, Mn calculated using A6.10.7.1.2-1

B. Dp > 0.1*Dt, Mn calculated using A6.10.7.1.2-2

C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)

E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)

F. Discretely braced tension flange governs (App A 6.1.2)

G. Continuously braced compression flange governs (App A 6.1.3)

H. Continuously braced tension flange governs (App A 6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange

(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer CL-625-ONT Lane Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

Madawaska Severe Stringer CL-625-ONT Lane Inv
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

Madawaska Severe Stringer CL-625-ONT Lane Inv
SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)
BEARING STIFFENER CHECK
RATING FACTORS - STRESS FLEXURAL CAPACITY

			SERV-IIB	POS.	0.0	N/A	0.0	0.0	0.0	0.0	0.0	0.0

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

** Legend of Resistance Calculation:

Compact Section:

A. $D_p \leq 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-1

B. $D_p > 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-2

C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)

E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)

F. Discretely braced tension flange governs (App A 6.1.2)

G. Continuously braced compression flange governs (App A 6.1.3)

H. Continuously braced tension flange governs (App A 6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer CL-625-ONT Lane Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress

due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or

A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked,
but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer MaineDOT Trucks 1-4
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 - F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity
 - M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1
 If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
 - w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
 - B. Based on the total stress in the bottom flange, this section is analyzed for positive
 flexure, so the top flange capacity is based on compression. However, the total
 factored stress (F+) in the top flange is tensile. The user should verify the
 acceptability of the section by comparing the top flange stress (F+) to the flexural
 resistance (Fr) of the top flange in negative flexure.
 - C. The unbraced range containing this analysis point varies in depth and has a flange
 transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

* An asterisk following the rating factor indicates that the rating is governed by lateral torsional buckling (AASHTO 6.10.8.2.3).

** Legend of Rating Failures:

- A. Section fails web proportion check
- B. Section fails one or more flange proportion checks
- C. Section fails ductility check
- D. Rating factor is less than 1.0

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $D_p \leq 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-1
- B. $D_p > 0.1 \cdot D_t$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 1-4
 SPECIAL #2 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 - F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity
 - M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1
 If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
 - w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
 - B. Based on the total stress in the bottom flange, this section is analyzed for positive
 flexure, so the top flange capacity is based on compression. However, the total
 factored stress (F+) in the top flange is tensile. The user should verify the
 acceptability of the section by comparing the top flange stress (F+) to the flexural
 resistance (Fr) of the top flange in negative flexure.
 - C. The unbraced range containing this analysis point varies in depth and has a flange
 transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
input lateral loads have been entered.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 1-4
SPECIAL #3 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
- F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
- M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
- w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive
flexure, so the top flange capacity is based on compression. However, the total
factored stress (F+) in the top flange is tensile. The user should verify the
acceptability of the section by comparing the top flange stress (F+) to the flexural
resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange
transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 1-4
 SPECIAL #4 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 - F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity
 - M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1
 If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
 - w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
 - B. Based on the total stress in the bottom flange, this section is analyzed for positive
 flexure, so the top flange capacity is based on compression. However, the total
 factored stress (F+) in the top flange is tensile. The user should verify the
 acceptability of the section by comparing the top flange stress (F+) to the flexural
 resistance (Fr) of the top flange in negative flexure.
 - C. The unbraced range containing this analysis point varies in depth and has a flange
 transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

OVERALL RATING SUMMARY W/O FWS (cont.)

BRIDGE LOAD RATINGS W/O FWS (cont.)

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS

S - SHEAR RATING FACTOR CONTROLS

Madawaska Severe Stringer MaineDOT Trucks 1-4
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

* Legend of General Notes:

- Rh = Hybrid factor
 Rb = Load shedding factor (only applies to compression flange)
 Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 $F+ = f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
 due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
 A6.10.8.1.2-1) and/or user input lateral effects
 w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Severe Stringer MaineDOT Trucks 5-8
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
 - F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
 - M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
 - w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
 - B. Based on the total stress in the bottom flange, this section is analyzed for positive
flexure, so the top flange capacity is based on compression. However, the total
factored stress (F+) in the top flange is tensile. The user should verify the
acceptability of the section by comparing the top flange stress (F+) to the flexural
resistance (Fr) of the top flange in negative flexure.
 - C. The unbraced range containing this analysis point varies in depth and has a flange
transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

* An asterisk following the rating factor indicates that the rating is governed by lateral torsional buckling (AASHTO 6.10.8.2.3).

** Legend of Rating Failures:

- A. Section fails web proportion check
- B. Section fails one or more flange proportion checks
- C. Section fails ductility check
- D. Rating factor is less than 1.0

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 5-8
 SPECIAL #2 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr
 - F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity
 - M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1
 If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
 - w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
 - B. Based on the total stress in the bottom flange, this section is analyzed for positive
 flexure, so the top flange capacity is based on compression. However, the total
 factored stress (F+) in the top flange is tensile. The user should verify the
 acceptability of the section by comparing the top flange stress (F+) to the flexural
 resistance (Fr) of the top flange in negative flexure.
 - C. The unbraced range containing this analysis point varies in depth and has a flange
 transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 5-8
SPECIAL #3 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

- ** Legend of General Notes:
- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
- F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
- M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
- w = Value for F+ or M+ includes lateral load effects

- *** Legend of Code Check:
- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive
flexure, so the top flange capacity is based on compression. However, the total
factored stress (F+) in the top flange is tensile. The user should verify the
acceptability of the section by comparing the top flange stress (F+) to the flexural
resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange
transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

Madawaska Severe Stringer MaineDOT Trucks 5-8
SPECIAL #4 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

BRIDGE LOAD RATINGS W/O FWS (cont.)

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS

S - SHEAR RATING FACTOR CONTROLS

Madawaska Severe Stringer MaineDOT Trucks 5-8
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.

When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to
wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

Madawaska Moderate Stringer HL-93 Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

MOMENT FLEXURAL CAPACITY (COMPOSITE, +FLEX, COMPACT OR APPENDIX A, NO LTB) (cont.)

** Legend of Resistance Calculation:

Compact Section:

A. $D_p \leq 0.1 \cdot D_t$, M_n calculated using A6.10.7.1.2-1

B. $D_p > 0.1 \cdot D_t$, M_n calculated using A6.10.7.1.2-2

C. Continuous span, M_n calculated using A6.10.7.1.2-3

Appendix A:

D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)

E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)

F. Discretely braced tension flange governs (App A 6.1.2)

G. Continuously braced compression flange governs (App A 6.1.3)

H. Continuously braced tension flange governs (App A 6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress

due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or

A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked,
but may be applicable.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Moderate Stringer HL-93 Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

SERVICE LIMIT STATE - FLEXURAL RESISTANCE (cont.)

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive

flexure in which the web satisfies the requirement of LRFD

Specifications Article 6.10.2.1.1

 SUMMARY - OVERALL REACTIONS

REACTIONS & ROTATIONS PER GIRDER (UNFACTORED, W/O IMPACT, W/ DISTRIBUTION)
 FOR ELASTOMERIC BEARING PAD DESIGN

Support No.		Minimum Reaction LC (kips)	Maximum Reaction LC (kips)	Live Load Rotation LC (radians)
1	Total DC1	0.87	0.87	
	Total DL	0.87	0.87	
	LL (SPECIAL #1)	0.00	30.68	0.003935
2	Total DC1	0.87	0.87	
	Total DL	0.87	0.87	
	LL (SPECIAL #1)	0.00	30.68	0.003935

Note: Rotation is about an axis normal to the centerline of the beam.
 The rotation value given is the larger of the positive
 rotation and absolute value of the negative rotation due
 to live load.

Location (ft)	18.54R

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)
SHEAR CAPACITY
BEARING STIFFENER CHECK
DEFLECTION LIMITS FOR LIVE LOAD
RATING FACTORS - MOMENT FLEXURAL CAPACITY
RATING FACTORS - STRESS FLEXURAL CAPACITY
RATING FACTORS - SHEAR CAPACITY

%WARNING - <Input Post Processor>:

The specified yield strength of the web should
 be greater than the maximum of 36 ksi or 70 percent
 of the specified yield strength of the higher
 strength flange. (LRFD 6.10.1.3)

For Material ID No. 1:

Web yield of 30. ksi is less than 36. ksi

 SPECIAL #1 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to
wind or user input effects, A6.10.7.1.1-1

w = Value for M+ includes lateral load effects

Madawaska Moderate Stringer HL-93 Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

MOMENT FLEXURAL CAPACITY (COMPOSITE, +FLEX, COMPACT OR APPENDIX A, NO LTB) (cont.)

** Legend of Resistance Calculation:

Compact Section:

- A. $D_p \leq 0.1 \cdot D_t$, M_n calculated using A6.10.7.1.2-1
- B. $D_p > 0.1 \cdot D_t$, M_n calculated using A6.10.7.1.2-2
- C. Continuous span, M_n calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A 6.1.2)
- G. Continuously braced compression flange governs (App A 6.1.3)
- H. Continuously braced tension flange governs (App A 6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress

due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or

A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked,
but may be applicable.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

Madawaska Moderate Stringer HL-93 Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of General Notes:

- Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr
F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity
M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1
If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity
w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

- A. Insufficient flexural resistance
B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

SERVICE LIMIT STATE - FLEXURAL RESISTANCE (cont.)

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

SPECIAL #1 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.
