SUMMARY OF BRIDGE RATING

VEHICLE TYPE		RF ¹	RT (TONS)	POSTING LOAD (TONS)
HL-93	INVENTORY	0.38	13.68	
	OPERATING	0.50	18.00	
HL-93 modified	INVENTORY	N/A	N/A	
	OPERATING	N/A	N/A	
CONFIGURATION 1		0.65	32.50	25.00
CONFIGURATION 2		0.55	25.85	16.79
CONFIGURATION 3		0.58	25.52	17.60
CONFIGURATION 4		0.60	26.40	18.86
CONFIGURATION 5		0.62	27.28	20.11
CONFIGURATION 6		0.47	17.84	9.22
CONFIGURATION 7		0.59	17.41	12.22
CONFIGURATION 8		0.92	17.20	16.56
CL-625-ONT INVENTORY		0.43	30.21	5.48
CL-625-ONT OPERATING		0.52	36.53	5.88

1 - Ratings listed reflect the overall condition of the bridge. Isolated areas of critical deterioration result in lower bridge load ratings as noted in the following tables.

Group 1 Posting Analysis (Configuration 1)

Governing Posting: 25.00
 Governing Load Model: CONFIGURATION 1

Group 2 Posting Analysis (Configurations 2 - 5)

Governing Posting: 16.79
 Governing Load Model: CONFIGURATION 2

Group 3 Posting Analysis (Configurations 6 - 8)

Governing Posting: 5.48
 Governing Load Model: N/A

Please check all the boxes that apply:

LRFR Evaluation Factors:

Live Load Distribution Factor: varies
 Impact Factor (LRFD): 0.33
 Impact Factor (CHBDM): 0.25
 Governing Condition Factor, ϕ_c : 0.9
 System Factor, ϕ_s : 0.9
 ADTT (one-way): 183

- ☐ Bridge load rating is governed by substructure rating
- ☐ Connections control the load rating
- ☐ Exterior girder controls load rating
- ☐ As-built load rating
- ☒ As-inspected load rating
- ☐ One Lane Loaded
- ☐ Advanced Analysis Used
- ☒ Actual Measurements Taken
- ☐ Finite Fatigue Life _____ years

* These rating values represent the as-inspected (2017) conditions for specific locations primarily in Spans 1 and 2. The floor system of the bridge consists of an open steel grid with tightly spaced stringers and likely has the potential to redistribute a portion of the load from these members to the adjacent members. However, based on the seriousness of the deterioration found during the inspection and the severity of the resulting ratings, a monitoring plan should be developed and implemented immediately. Repairs should be made to the stringers with critical section loss on a high-priority basis.

Madawaska International Bridge Rating

GENERAL DESCRIPTION OF SECTION LOSSES AND LOAD RATING RESULTS:

Truss and Gusset Plates:

The trusses and gusset plates are rated by adjusting the capacity condition factor based on deterioration observed during the 2017 inspection.

Floorbeams Conditions:

The floorbeams are rated based on section losses measured during the 2017 inspection. Four conditions are evaluated with the controlling rating results being reported for each vehicle. The conditions considered are: two different severe conditions with losses to the web and flanges; a section with moderate losses to the web and flanges; and a section without any losses.

For critical floorbeam locations, see the framing sketches included herein. In each span, approximately 10% of the floorbeams exhibit severe section loss and approximately 10%-20% of the floorbeams exhibit moderate section loss.

Stringer Conditions:

The stringers are rated based on section losses measured during the 2017 inspection. Four conditions are evaluated with the controlling rating results being reported for each vehicle. The conditions considered are: critical section losses to both the webs and flanges; severe section losses to the webs and flanges; moderate section losses to webs and flanges; and minor section losses. For a description of the section losses and application of the section losses within the analysis, see the calculation cover page of the stringer rating section. The critical and severe section losses are limited to Spans 1 and 2.

For critical stringer rating locations, see the framing sketch.

Span 1 (Canadian Side):

- One stringer exhibits a corrosion crack in the web at its end, which results in a shear load rating of 0.0.
- Approximately 50% of the stringers exhibit critical section loss along most of their length which results in a moment load rating of 0.12 at midspan.
- Approximately 50% of the stringers exhibit severe section loss at their ends which results in a shear load rating of 0.68 and a moment load rating of 0.44.
- Approximately 50% of the stringers exhibit moderate section loss at their ends which results in a shear load rating of 0.77.
- Approximately 50% of the stringers exhibit moderate section loss along most of their length which results in a moment load rating of 0.61.

Madawaska International Bridge Rating

Span 2 (Canadian Side):

- This span contains no critical section loss at the ends (high shear zone).
- Approximately 20% of the stringers exhibit critical section loss along most of their length which results in a moment load rating of 0.12 at midspan.
- Approximately 20% of the stringers exhibit severe section loss at their ends which results in a shear load rating of 0.68 and a moment load rating of 0.44.
- Approximately 80% of the stringers exhibit moderate section loss at their ends which results in a shear load rating of 0.77.
- Approximately 80% of the stringers exhibit moderate section loss along most of their length which results in a moment rating of 0.61.

Spans 3 and 4 (U.S. Side):

- All stringers have load ratings based on minor section losses to full section remaining.

HNTB 2017 and PB 2012 Floorbeam and Stringer Load Rating Comparison:

HL-93 Inventory Rating	HNTB 2017	PB 2012
Floorbeam Flexure	0.38	0.65
Floorbeam Shear	0.82	1.19
Stringer Flexure	0.44 (0.12*)	0.83
Stringer Shear	0.68 (0.00*)	1.40

*Critical Locations

SPAN 1 (CANADIAN SIDE) - CRITICAL LOAD RATING LOCATIONS

HL-93 Inventory

A visual inspection of all superstructure members determined that approximately 50% of the stringers in Span 1 and 20% of the stringers in Span 2 exhibit this critical condition and corresponding low load rating value. The four locations shown in the sketch below are just a sample of the critical locations that were field measured during the 2017 visual and hands-on inspection. Due to the extent of the measured section loss, these locations were selected to be load rated as part of the 2017 load rating.

Legend:

- Location of physical measurements. Measurements indicate critical section losses which are prevalent in 50% of the stringers in Span 1 and 20% of the stringers in Span 2.

SPAN 1

KEY PLAN

SPAN 2 (CANADIAN SIDE) - CRITICAL LOAD RATING LOCATIONS

HL-93 Inventory

A visual inspection of all superstructure members determined that approximately 10% of the floorbeams in all spans exhibit this severe condition and corresponding low load rating value. The location shown in the sketch below is just a sample of the a severe location that was field measured during the 2017 visual and hands-on inspection. Due to the extent of the measured section loss, this location was selected to be load rated as part of the 2017 load rating.

Legend:

- Location of physical measurements. Measurements indicate severe section losses which are prevalent in 10% of the floorbeams in all spans.

SPAN 3 (U.S. SIDE) - CRITICAL LOAD RATING LOCATIONS

HL-93 Inventory - No locations identified

SPAN 4 (U.S. SIDE) - CRITICAL LOAD RATING LOCATIONS

HL-93 Inventory

A visual inspection of all superstructure members determined that approximately 10% of the floorbeams in all spans exhibit this severe condition and corresponding low load rating value. The two locations shown in the sketch below are just a sample of the severe locations that were field measured during the 2017 visual and hands-on inspection. Due to the extent of the measured section loss, these locations were selected to be load rated as part of the 2017 load rating.

Legend:

Location of physical measurements. Measurements indicate severe section losses which are prevalent in 10% of the floorbeams in all spans.

DESCRIPTION OF BRIDGE

Bridge Number:	2399
Owner:	STATE HIGHWAY AGENCY
Maintained By:	STATE HIGHWAY AGENCY
Location:	MADAWASKA
Route Carried:	BRIDGE STREET
Feature Intersected:	ST. JOHN RIVER & CANADIAN NATIONAL RAIL
Latest NBI Inspection Date:	07/27/2017
Field Verification Date:	N/A
Date of Construction:	1921
Bridge Type:	RIVETED STEEL PARKER THROUGH TRUSS WITH ROLLED STEEL FLOORBEAMS AND ROLLED STEEL STRINGERS
Material Properties:	STRUCTURAL STEEL: $f_y = 30,000$ psi (based on year built, 1921)
Original Design Loading:	H20
Date(s) of Rebuild/Rehab :	1960, 1980, 2001
Description of Rebuild/Rehab :	VARIOUS REPAIRS INCLUDING DECK REPLACEMENT, AND SOME STRINGER REPLACEMENT
Posting:	OPEN, NO RESTRICTIONS
Superstructure:	RIVETED STEEL PARKER THROUGH TRUSS
Substructure:	CAST-IN-PLACE REINFORCED CONCRETE ABUTMENTS AND CAST-IN-PLACE REINFORCED CONCRETE PIERS
Bearings:	ROLLER NEST EXPANSION BEARINGS AND STEEL LAMINATED ELASTOMERIC BEARINGS
Bridge Spans:	SPANS 1 - 4 (EACH) = 232'-0" (c. - c. brgs.)
Bridge Skew:	0°0'0"
Bridge Width:	32'-2 1/2" OUT-TO-OUT
Roadway Width:	20'-8" CURB-TO-CURB
Roadway Surface:	OPEN GRID DECK
Curbs:	STEEL CURBS
Sidewalk/Walkway/Median:	6'-0" CONCRETE SIDEWALK 4 INSULATED PIPES ADDED IN 1980 TO CARRY PULP- RELATED SLURRY FROM PAPER PLANT
Utilities:	
Bridge Railing:	STEEL BRIDGE RAILINGS
Approach Railing:	W-SHAPED GUIDERAIL & CONCRETE BARRIER
Wearing Surface Condition:	N/A
Bridge Railing Condition:	6 SATISFACTORY
Deck Condition:	4 POOR
Superstructure Condition:	4 POOR
Bearing Condition:	3 SERIOUS
Abutment Condition:	5 SATISFACTORY
Pier Condition:	5 SATISFACTORY

(Madawaska, ME)**

Load Rating Criteria and Assumptions

As part of the 2017 bridge inspection performed by HNTB, HNTB was requested to update the 2012 load ratings performed by PARSONS BRINKERHOFF (PB). The level of effort requested for the updated ratings included revisions to the existing ratings by reusing as much available information as possible and incorporating current member conditions. In addition to accounting for current conditions, ratings for the Canadian design vehicle, CL-625-ONT, were developed.

Updating the ratings for current condition involved reusing the existing HL-93 live load and dead load effects for the elements being evaluated. For the stringers and floorbeams, the member capacities were updated according to section losses noted in the 2017 inspection. For truss members and gusset plates, the member capacities were taken from the 2012 load ratings and only adjusted based on changes to condition factors from the AASHTO MBE.

Ratings for the Canadian CL-625-ONT are based on the AASHTO methodology, but incorporated the live load factors according to the Canadian Highway Bridge Design Code (CHBDC).

The following information was obtained from As-Built bridge plans and the Highway Bridge Inspection Report. All the information listed below was utilized to develop the LRFR bridge load rating presented herein.

Project Location:

The Madawaska Bridge connects Madawaska, Maine, USA and Edmundston, New Brunswick, Canada, carrying Bridge Street over the St. John River and Canadian National Rail.

Bridge Description:

The Madawaska Bridge is a 938'-6" long (c - c brgs) 4-span structure built in 1921. All truss spans are identical spans of 232'-0" (c - c brgs) with three 3'-6" spaces between bearing lines on the piers. The bridge was rehabilitated in 1960, 1980, and 2001, which included deck replacement and some stringer replacement. The superstructure is a riveted steel Parker through truss with a stringer and floorbeam system supporting a steel grid deck. The stringers are spaced 2'-7" on center with a roadway width of 20'-8". Both abutments have a 0 degree skew.

Bridge Inspection Report & Site Visit Information:

The following information was obtained from the Highway Bridge Inspection Report which reflects the most recent MaineDOT bridge inspection findings.

Year Built:	1921
Year Reconstructed:	1960, 1980, 2001
ADT (2014):	3,684
Truck ADT:	9%
Condition Ratings:	Deck 4 (Poor) Superstructure 4 (Poor) Substructure 5 (Fair)

Condition assessment was based off of the 2017 Inspection Report. All As-Built plans are assumed to be correct and the load rating was performed based on the information provided.

Madawaska Bridge
Bridge No. 2399

Rating Criteria:

The following information was used to complete the enclosed load rating computations.

Serviceability & Fatigue

The MaineDOT Load Rating Guide article 3.7.1, indicates the serviceability checks are to be evaluated on individual basis where the bridge's use, structure type, or specific details may cause concern. HNTB was directed by the Department to not perform any additional work beyond updating the existing ratings that were developed as part of the 2012 load ratings. It should be noted that the 2017 inspection performed by HNTB did note several conditions including stress cracks to stringers, that would warrant a serviceability evaluation. Fatigue life was not evaluated as part of the 2012 load rating and following the guidance from the Department, new fatigue life calculations were not developed. Its recommended that a serviceability and fatigue life evaluation be performed during the next analysis or load rating of the structure.

Live Load

Canadian Vehicle:	The CL-625-ONT was rated based on the AASHTO methodology but used the live load factors based on the CHBDC. Therefore the member capacities, limit states, system factors, condition factors, distribution factors, dead load factor, and rating equation were based on AASHTO. The multiple presence factor, dynamic loading factors, and live load factors were based on the CHBDC.
Dynamic Impact Factor:	IM = 1.33 for HL-93 & MaineDOT Legal Loads IM = 1.25 for CL-625-ONT Truck IM = 1.00 for CL-625-ONT Lane Load
Live Load Configurations:	AASHTO HL-93 and CL-625-ONT were evaluated for all ratings. If the HL-93 inventory rating was below 1.0 then Maine State Legal Load Configurations 1 - 8 were also evaluated.

CL-625-ONT Lane load

Live Load Distribution: Transverse placement of axle loads was based on existing lanes (two 10'-0" lanes with two 4" shoulders) per article 6A.2.3.2 of the Manual for Bridge Evaluation. Distribution factors were taken from the 2012 PB Load Rating.

Live Load Factors: HL-93 $\gamma_{LL} = 1.75$ (Inventory) & 1.35 (Operating)
State Legals $\gamma_{LL} = 1.3$ per MBE Tables B6A-2 and B6A-3 for ADTT < 1,000
CL-625-ONT $\gamma_{LL} = 1.63$ (Inventory) & 1.35 (Operating) Per CHBDC 14.8
The Canadian live load factors were based on selecting a reliability index. The reliability indexes chosen for the ratings were 3.5 for inventory and 2.5 for operating based on AASHTO MBE C6A.1.3. Using the reliability indexes from the AASHTO MBE, live load factors were selected from the CHBDC Table 14.8.

Condition Factors

Stringers/Floorbeams: $\phi_c = 0.90$ (poor condition, 0.85, per Inspection Report, MBE Table 6A.4.2.3)
(add 0.05, field measured section losses, MBE C6a.4.2.3)
Truss & Gusset Plates: $\phi_c = 0.95$ (fair condition, per Inspection Report, MBE Table 6A.4.2.3)
(elements at or below the roadway)
Truss & Gusset Plates: $\phi_c = 1.00$ (satisfactory condition, per Inspection Report, MBE Table 6A.4.2.3)
(elements at mid height of the truss or above)

System Factors

Stringers: $\phi_s = 1.00$ (Redundant Stringer Subsystems btwn FBs, MBE Table 6A.4.2.4-1)
Floorbeams: $\phi_s = 0.85$ (FBs Spa > 12ft w noncontinuous stringers, MBE Table 6A.4.2.4-1)
Truss & Gussets: $\phi_s = 0.90$ (Riveted Members in Truss, MBE Table 6A.4.2.4-1)

Materials

Structural Steel: $f_y = 30$ ksi (Per the 2012 load rating, consistent with MBE Table 6A.6.2.1-1 for year built of 1921)

Madawaska Bridge
Bridge No. 2399

Summary of Load Rating Calculations:

This load rating was developed using a LRFR methodology and in accordance with the Maine Department of Transportation guidelines. The calculations herein reflect one method of analysis. The analysis was performed based on the MBE code-prescribed analytical procedures. The trusses, floorbeams, stringers, and gusset plates were rated for the HL-93 design load. If the Inventory Rating Factor for the HL-93 was less than 1.0, the controlling elements were also rated for the eight MaineDOT Legal Load Configurations. Additionally, load rating factor were provided for the Canadian vehicle CL-625-ONT. The floorbeams and stringers were found to have significantly low ratings factors based on the section losses documented in the 2017 inspection. These elements should be considered in determining the safe load carrying capacity of the structure. In revising the gusset plate ratings a few items were noted that should be further investigated regarding the way member capacities were determined.

Assumptions:

- Dead loads on all members were based on the 2012 load rating report.
- Live load effects for the HL-93 were based on the 2012 load rating report.
- Distribution factors were based on the 2012 load rating report.
- Live load effects for the State Legal loads were based on the 2012 load rating report where available. If not available, new load effects were developed for the legal loads based on the 2012 load rating approach.
- Member capacities for the truss members and gusset plates were based on the 2012 load rating report.
- Section losses and member condition factors were taken from the HNTB 2017 inspection report.
- Additional assumptions and analysis approaches were further described within each section of this rating report.

TRUSS LOAD RATING ANALYSIS

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06

Project: Madawaska Bridge Rating	Job No: 63738	Design Criteria Document: 1
Client: MaineDOT	Discipline: Structures	Calculation No: 1

Name or Description of Calculation: Madawaska Bridge Rating – Truss Members				
Calc. Rev. No.	Originator	Checker	Senior Technical Reviewer (if required)	Confirmation Required (Y/N)
1	James Anderson	Shane M. Zeller		

Calculation Objective:
Determine load ratings for the truss members of Madawaska Bridge.

Calculation Methodology/List of Assumptions:
The truss members were rated for the following vehicles:

- AASHTO HL-93
- Maine State Legal Loads
- CHBDC CL-625-ONT (Canadian Vehicle)

HNTB was requested to provide an update to the 2012 load rating performed by PARSONS BRINKERHOFF (PB). The revised ratings would consider the latest condition finding from HNTB's 2017 inspection and include the Canadian vehicle CL-625-ONT.

Per the project scope, HNTB used the existing dead loads, existing HL-93 load effects and member capacities from the 2012 PB rating. HNTB calculated load effects for the Canadian vehicle and legal loads as needed, and adjusted the member capacities using system factors and condition factors. The condition factors were based on the conditions found during the HNTB 2017 inspection. Using the revised member capacities and load effects, new rating values were calculated. HNTB was not scoped to calculate section properties based on section losses and member dimensions.

Based on the inspection, a condition factor of 0.95 was used for the bottom chord and members attached to the bottom chord. A condition factor of 1.0 was used for the top chord and members connected to mid-point gusset plates that extend to the top chord. A system factor of 0.90 was used because the bridge is a riveted truss.

In calculating the ratings for the Canadian vehicle, the method agreed upon in the scope was to follow the MaineDOT load rating manual & AASHTO MBE with the exception that the CHBDC live load factors would be used. This included the multiple presence factor (0.9, 2 lane), dynamic loading allowance factor (1.25 for truck, 1.0 lane load), and live load factors (1.63 inv. & 1.35 oper.). The Canadian live load factors were based on selecting reliability indexes. The reliability indexes chosen for the ratings were 3.5 for inventory and 2.5 for operating based on AASHTO MBE C6A.1.3.

The rating was performed in the following manner: The existing truss member ratings were performed in the TRAP program by PB. HNTB reviewed the output file from the TRAP analysis and retrieved the truss geometry, member section properties, and distribution factors. With the data from the PB analysis, HNTB created a model in PennDOT's BAR7 program. The model was run with all the required vehicles including the HL93. Though the HL93 load effects were not used for the final ratings, they were used to verify that the load effects from BAR7 matched the load effects from TRAP, which validated the BAR7 model. Following development of the BAR7 analysis the load effects were exported to EXCEL and post-processed to a usable format. EXCEL was used to combine the CL-625-ONT lane load with the CL-625-ONT truck because the truck and lane cannot be run together in BAR7. The data was used to determine if lane load

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 2 of <u>2</u>

or truck controlled for the CL-625-ONT. EXCEL spreadsheets were then developed to modify the existing member capacities and calculate new rating factors.

2012 PB Load Rating References

Conclusions:

See rating summary table.
Note the 2012 PB loading did not include a system or condition factor. Though the overall conditions of the truss members have not changed the inclusion of the appropriate factors did reduce the ratings and required the Maine State Legal loads to be rated.

BAR7 INPUT INFORMATION (FROM 2012 PB LOAD RATING)

2012 PB LOAD RATING

RATING ANALYSIS ASSUMPTIONS AND CRITERIA

The inventory and operating capacity of the bridge was rated in accordance with the provisions of:

- The Manual for Bridge Evaluation, First Edition 2008, published by AASHTO
- American Association of the State Highway and Transportation Officials (AASHTO) Load and Resistance Factor Design Specifications, 5th Ed. 2010 and Interim Revisions
- Maine Department of Transportation. *Draft Load Rating Guide*. 2012.

The following material strengths were used in the rating:

Original Section:

- Structural Steel: Fy = 30,000 psi (Assumed based on year built)
Fu = 60,000 psi (Assumed based on year built)

Live load was based on the MaineDOT Load Rating Guide. Ratings were performed using an HL-93 truck initially. If ratings were below 0.95 then Maine Legal Load truck ratings were performed.

Trusses were rated using TRAP software version 1.5 by the BEST Center. The steel stringers were rated using MERLIN-DASH Version 5.3 WSD/LFD/LRFD software by the BEST Center. Floorbeams were rated using a spreadsheet with loads generated from GTSTRUDL. Gusset plates were rated using spreadsheets. Spreadsheets for floorbeams and gusset plates were validated by manual computations.

Rating was performed based on the information shown on the drawings provided by the state, and current inspection reports. The inspection report noted corrosion in one floorbeam. This was subtracted from the moment of inertia for the floorbeams calculations. See floorbeam calculations for details. The inspection report also noted utilities which were added to the dead load calculations for the truss.

LIVE LOAD DISTRIBUTION FACTORS

BASED ON DESIGN LANES
 TRUSS TRUSS
 FORCE DEFLECTION
 1.014(2) 1.000(2)

BAR7 calculated distribution factor.

Slightly conservative to PB's 1.01 factor. →

NOTE: IF A SECTION DOES NOT MEET FLANGE OR WEB BUCKLING CRITERIA OF CURRENT AASHTO SPECIFICATIONS FOR LOAD FACTOR METHOD, THE RATING FACTORS ARE REPRINTED AS 888.88. THIS INDICATES THAT THERE IS A POTENTIAL FATIGUE PROBLEM.

NOTE: THE ALLOWABLE STRESS IN AN ECCENTRICALLY LOADED COMPRESSION MEMBER IS COMPUTED BY THE SECANT FORMULA. SEE ARTICLE 5.4.2 OF THE 1978 AASHTO MANUAL FOR MAINTENANCE INSPECTION OF BRIDGES.

NOTE: THE COMPRESSION CAPACITY OF THE CORRESPONDING TOP CHORDS AND VERTICAL CHORDS AT EACH SPECIFIED FLOORBEAM LOCATION MAY NOT BE MODIFIED BECAUSE THIS IS NOT A PONY TRUSS OR THE LATERAL STABILITY ANALYSIS IS NOT REQUESTED.

 * TRUSS - LIVE LOAD SP-1 *

LIVE LOAD DISTRIBUTION FACTORS

BASED ON DESIGN LANES
 TRUSS TRUSS
 FORCE DEFLECTION
 1.014(2) 1.000(2)

BAR7 calculated distribution factor.

Slightly conservative to PB's 1.01 factor. —→

NOTE: IF A SECTION DOES NOT MEET FLANGE OR WEB BUCKLING CRITERIA OF CURRENT AASHTO SPECIFICATIONS FOR LOAD FACTOR METHOD, THE RATING FACTORS ARE REPRINTED AS 888.88. THIS INDICATES THAT THERE IS A POTENTIAL FATIGUE PROBLEM.

NOTE: THE ALLOWABLE STRESS IN AN ECCENTRICALLY LOADED COMPRESSION MEMBER IS COMPUTED BY THE SECANT FORMULA. SEE ARTICLE 5.4.2 OF THE 1978 AASHTO MANUAL FOR MAINTENANCE INSPECTION OF BRIDGES.

NOTE: THE COMPRESSION CAPACITY OF THE CORRESPONDING TOP CHORDS

AND VERTICAL CHORDS AT EACH SPECIFIED FLOORBEAM LOCATION
MAY NOT BE MODIFIED BECAUSE THIS IS NOT A PONY TRUSS OR
THE LATERAL STABILITY ANALYSIS IS NOT REQUESTED.

* TRUSS - LIVE LOAD SP-1 *

CL-625-ONT Truck Only
(Not to combine with lane load)

LIVE LOAD DISTRIBUTION FACTORS

BASED ON DESIGN LANES
 TRUSS TRUSS
 FORCE DEFLECTION
 1.014(2) 1.000(2)

BAR7 calculated distribution factor.

Slightly conservative to PB's 1.01 factor. —→

NOTE: IF A SECTION DOES NOT MEET FLANGE OR WEB BUCKLING CRITERIA OF CURRENT AASHTO SPECIFICATIONS FOR LOAD FACTOR METHOD, THE RATING FACTORS ARE REPRINTED AS 888.88. THIS INDICATES THAT THERE IS A POTENTIAL FATIGUE PROBLEM.

NOTE: THE ALLOWABLE STRESS IN AN ECCENTRICALLY LOADED COMPRESSION MEMBER IS COMPUTED BY THE SECANT FORMULA. SEE ARTICLE 5.4.2 OF THE 1978 AASHTO MANUAL FOR MAINTENANCE INSPECTION OF BRIDGES.

NOTE: THE COMPRESSION CAPACITY OF THE CORRESPONDING TOP CHORDS

AND VERTICAL CHORDS AT EACH SPECIFIED FLOORBEAM LOCATION
MAY NOT BE MODIFIED BECAUSE THIS IS NOT A PONY TRUSS OR
THE LATERAL STABILITY ANALYSIS IS NOT REQUESTED.

* TRUSS - LIVE LOAD SP-1 *

LIVE LOAD DISTRIBUTION FACTORS

BASED ON DESIGN LANES
 TRUSS TRUSS
 FORCE DEFLECTION
 1.014(2) 1.000(2)

BAR7 calculated distribution factor.

Slightly conservative to PB's 1.01 factor. —→

NOTE: IF A SECTION DOES NOT MEET FLANGE OR WEB BUCKLING CRITERIA OF CURRENT AASHTO SPECIFICATIONS FOR LOAD FACTOR METHOD, THE RATING FACTORS ARE REPRINTED AS 888.88. THIS INDICATES THAT THERE IS A POTENTIAL FATIGUE PROBLEM.

NOTE: THE ALLOWABLE STRESS IN AN ECCENTRICALLY LOADED COMPRESSION MEMBER IS COMPUTED BY THE SECANT FORMULA. SEE ARTICLE 5.4.2 OF THE 1978 AASHTO MANUAL FOR MAINTENANCE INSPECTION OF BRIDGES.

NOTE: THE COMPRESSION CAPACITY OF THE CORRESPONDING TOP CHORDS AND VERTICAL CHORDS AT EACH SPECIFIED FLOORBEAM LOCATION

MAY NOT BE MODIFIED BECAUSE THIS IS NOT A PONY TRUSS OR
THE LATERAL STABILITY ANALYSIS IS NOT REQUESTED.

* TRUSS - LIVE LOAD SP-1 *

		ALLOWABLE STRESS RATING		LOAD FACTOR RATING	
LOAD		FACTOR	TONS	FACTOR	TONS
SP-1	IR (CRITICAL)	5.03	0.0	*****	*****
	OR (CRITICAL)	6.27	0.0	*****	*****

NOTE: LOAD FACTOR RATING WAS NOT PERFORMED BECAUSE ADDITIONAL TRUSS MEMBER PROPERTIES WERE NOT INPUT.

BAR7 v7.14.0.1 PROGRAM WAS EXECUTED COMPLETELY AND SUCCESSFULLY.

This is not applicable because it is based off of LFD and dead loads are not included and it is not combined with truck load.

HNTB

Calculation of rating factors for the Truss members. Note, base member capacities and dead loads taken from 2012 PB loading.
Condition factors based on 2017 HNTB inspection. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation

Vehicle being Evaluated is the **Maine Legal Load-1**

BAR7 used to determine live load effects, see output file.

System Factor : **0.90** Dead load Factor (γ_{DC}) **1.25**
Dynamic loading factor **1.33**

Live load Factor (γ_{LL}) **1.3**

$$\frac{C - \gamma_{DC} * DC}{\gamma_{LL} * (LL - IM)} \quad 6A.4.2.1-1$$

$$C = \phi_c \phi_s \phi_{R_n} \quad 6A.4.2.1-2$$

HNTB

Calculation of rating factors for the Truss members. Note, base member capacities and dead loads taken from 2012 PB loading.
Condition factors based on 2017 HNTB inspection. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation

Vehicle being Evaluated is the **Maine Legal Load-6**

BAR7 used to determine live load effects, see output file.

System Factor : **0.90** Dead load Factor (γ_{DC}) **1.25**
Dynamic loading factor **1.33**

Live load Factor (γ_{LL}) **1.3**

$$\frac{C - \gamma_{DC} * DC}{\gamma_{LL} * (LL + IM)} \quad 6A.4.2.1-1$$

$$C = \phi_c \phi_s \phi R_n \quad 6A.4.2.1-2$$

HNTB

Calculation of rating factors for the Truss members. Note, base member capacities and dead loads taken from 2012 PB loading.
Condition factors based on 2017 HNTB inspection. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation

Vehicle being Evaluated is the **Maine Legal Load-8**

BAR7 used to determine live load effects, see output file.

System Factor :	0.90	Dead load Factor (γ_{DC})	1.25
		Dynamic loading factor	1.33

Live load Factor (γ_{LL})	1.3

HNTB

Calculation of rating factors for the Truss members. Note, base member capacities and dead loads taken from 2012 PB loading.

Condition factors based on 2017 HNTB inspection. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation

Vehicle being Evaluated is the **Canadian CL-625-ONT Truck load**

BAR7 used to determine live load effects, see output file.

System Factor :	0.90	Dead load Factor (γ_{DC})	1.25
Multi presence factor:	0.90	Dynamic loading factor	1.25

Live load Factor (γ_{LL}) (inv)	1.63
Live load Factor (γ_{LL}) (Opr)	1.35

HNTB

Calculation of rating factors for the Truss members. Note, base member capacities and dead loads taken from 2012 PB loading.

Condition factors based on 2017 HNTB inspection. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation

Vehicle being Evaluated is the Canadian **CL-625-ONT Lane load**

BAR7 used to determine live load effects, see output file.

Combine the unfactored load effects for the lane load and determine the controlling rating factors between truck loading and lane for the Canadian CL-625-ONT on the truss members. Load effects for the CL-625-ONT Lane were taken from the BAR7 analysis. The truss was analyzed by BAR7 to develop the load effects, however the program will not combine the truck load and lane load internally.

GUSSET PLATE LOAD RATING ANALYSIS

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 1 of __

Project: Madawaska Bridge Rating	Job No: 63738	Design Criteria Document: 1
Client: MaineDOT	Discipline: Structures	Calculation No: 1

Name or Description of Calculation: Madawaska Bridge Rating – Gusset Plate				
Calc. Rev. No.	Originator	Checker	Senior Technical Reviewer (if required)	Confirmation Required (Y/N)
1	James Anderson	Shane M. Zeller		

Calculation Objective:
Determine load ratings for the gusset plates of Madawaska Bridge.

Calculation Methodology/List of Assumptions:
The gusset plates were rated for the following vehicles:

- AASHTO HL-93
- Maine State Legal Loads
- CHBDC CL-625-ONT (Canadian Vehicle)

HNTB was requested to provide an update to the 2012 load rating performed by PARSONS BRINKERHOFF (PB). The revised ratings would consider the latest condition finding from HNTB's 2017 inspection and include the Canadian vehicle CL-625-ONT.

Per the scope, HNTB used the existing dead loads, existing HL-93 load effects, and gusset plate capacities from the 2012 PB rating. HNTB calculated load effects for the Canadian vehicle and legal loads as needed, and adjusted the gusset plate capacities using system factors and condition factors. The condition factors were based on the conditions found during the HNTB inspection. Using the revised gusset plate capacities and load effects, new rating values were calculated. HNTB was not scoped to calculate gusset plate properties based on section losses and gusset plate dimensions.

Based on the inspection, a condition factor of 0.95 was used for the gusset plates attached to the bottom chord and a condition factor of 1.0 was used for the gusset plates connected to mid points and the top chord. A system factor of 0.90 was used because the bridge is a riveted truss.

In calculating the ratings for the Canadian vehicle, the method agreed upon in the scope was to follow the MaineDOT load rating manual & AASHTO MBE with the exception that the CHBDC live load factors would be used. This include the multiple presence factor (0.9, 2 lane), dynamic load allowance factor (1.25 for truck, 1.0 lane), and live load factors (1.63 inv. & 1.35 oper.). The Canadian live load factors were based on selecting reliability indexes. The reliability indexes chosen for the ratings were 3.5 for inventory and 2.5 for operating based on AASHTO MBE C6A.1.3.

PennDOT's BAR7 program was used to rate the truss members. Following the truss member ratings with the load effects from BAR7, the load effects were exported to EXCEL and post processed to a usable format. Excel was used to combine the CL-625-ONT lane load with the CL-625-ONT truck because the truck and lane cannot be run together in BAR7. The data was used to determine if the lane load or truck controlled for the CL-625-ONT. EXCEL spread sheets were then developed to modify the existing member capacities and calculate new rating factors.

Conclusions:

See rating summary table.

Throughout the rating process, some gusset plate ratings from the PB report were found to be missing pertinent information:

- Panel Point L2, member U2-L2 had no compression capacity given for compression check. The live load effects are significantly higher than the dead load effect at this location. This element should be rated to verify adequate capacity.
- Panel Point L4, members M3-L4 & U4-L4 had no compression capacity given for compression check. The live load effects are significantly higher than the dead load effect at this location. These elements should be rated to verify adequate capacity.
- Panel Point L6, member M5-L6 had no compression capacity given for compression check. The live load effects are significantly higher than the dead load effect at this location. This element should be rated to verify adequate capacity.
- Panel Point U2, member U2-L2 had no compression capacity given for compression check. The live load effects are significantly higher than the dead load effect at this location. This element should be rated to verify adequate capacity.
- Panel Point U4, members U4-L4 & M5-U44 had no compression capacity given for compression check. The live load effects are significantly higher than the dead load effect at this location. These elements should be rated to verify adequate capacity.

For gusset plates M3 & M5, HNTB did not agree with how the horizontal shear loads were calculated. It is our opinion that the force effects should be calculated along parallel to the continuous member. HNTB calculated the load effects this way, but compared them to the PB capacity. In the future, the capacity along this line should be verified. It does not appear that the 2012 load rating considered unsupported edge checks. Future rating should consider the AASHTO MBE unsupported edge requirements.

Combine the Unfactored load effects for the lane load and determine the controlling loading between truck loading and lane for the Canadian CL-625-ONT on the truss members. Load effects for the CL-625-ONT Lane were taken from the BAR7 analysis. The truss was analyzed by BAR7 to develop the load effects, however the program will not combine the truck load and lane load internally.

Dynamic load factor : 1.25 applies to Truck only, dynamic load factor for lane+truck

RATING CALCULATIONS

For	Madawaska International Crossing	Job No.	63738	Sheet No.	
Made by	SMZ	Checked by	JMA	Backchecked by	SMZ
Date	10/5/17	Date	10/7/17	Date	10/8/17

Gusset Plate being Evaluated is Panel Point L0

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Condition & System Factors, Per AASHTO MBE 6A.4.2.3 & 6A.4.2.4

	System	Condition	Combined
PB	0.90	0.95	0.855
HNTB	0.90	0.95	0.855
Adjustment Factor			1.00

Load Factors, Per AASHTO MBE 6A.4.2.2 and Canadian Highway Bridge Design Code 14.3

Dc	1.25			
Live Load	Inventory	Operating	Legal	Dynamic
HL-93	1.75	1.35	---	1.33
State Legal	---	---	1.30	1.33
CL-625-ONT	1.63	1.35	---	1.25

Multiple Presence factors

Live Load	HL-93*	State Legal	CL-625-ONT
Factor	1.00	1.00	0.90

HNTB

Gusset Plate being Evaluated is Panel Point L1

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Gusset Plate being Evaluated is Panel Point L3

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Gusset Plate being Evaluated is Panel Point L4

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

Gusset Gross Horizontal Shear Evaluation

Per the AASHTO MBE conservatively ignore concurrent member forces, and use the maximum horizontal force on the gusset plate induced by the members. Determine the worst load case then use the forces from that load case to determine the rating factor for the gusset plate.

HNTB

Gusset Plate being Evaluated is Panel Point L5

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Gusset Plate being Evaluated is Panel Point L6

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Condition & System Factors, Per AASHTO MBE
6A.4.2.3 & 6A.4.2.4

	System	Condition	Combined
PB	0.90	0.95	0.855
HNTB	0.90	0.95	0.855
	Adjustment Factor		1.00

Load Factors, Per AASHTO MBE 6A.4.2.2 and Canadian Highway
Bridge Design Code 14.3

Dc	1.25

Gusset Plate being Evaluated is Panel Point M5

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member.

Condition & System Factors, Per AASHTO MBE 6A.4.2.3 & 6A.4.2.4

Gusset Plate being Evaluated is Panel Point U2

Calculation of Gusset Plate rating factors for the HL93 and Canadian CL-625-ONT. Note, base member capacities and dead loads taken from 2012 PB load rating. Ratings calculated in accordance with AASHTO Manual for Bridge Evaluation.

BAR7 used to determine live load effects, see output files in the Truss Rating Analysis section.

Methodology used is as follows: Reuse member capacities, Dead loads, and HL93 loading from the 2012 load rating. Revise the member capacities by adjusting the System factor and Condition based on the finding from HNTB's 2017's inspection. Note the gusset plate capacities used in the 2012 load rating were further reduced by 10% to account for the possibility of sudden failure without redundant elements.

The rating calculations are in accordance with AASHTO's MBE equation 6A.4.2.1-1. This is accomplished by first determining the current element capacity, then dead and live loads are factored. A rating factor is then calculated by subtracting the dead load from the capacity and dividing by the live load.

Capacity adjustment by use of system and condition factors. Calculate the capacity modification factor used in the 2012 load rating, calculate the capacity modification factor appropriate for the current load rating. Divide the new capacity factor by the 2012 factor and then multiply the 2012 capacities by this adjustment value to determine the revised capacities. Note the capacities are given per gusset plate and there are two plates per panel point. In the rating equation, the gusset plate capacity is multiplied by two to account for this as all loads are listed per member. The gusset plate shear capacities are not multiplied by two.

Condition & System Factors, Per AASHTO MBE 6A.4.2.3 & 6A.4.2.4

FLOORBEAM LOAD RATING ANALYSIS

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 1 of __

Project: Madawaska Bridge Rating	Job No: 63738	Design Criteria Document: 1
Client: MaineDOT	Discipline: Structures	Calculation No: 1

Name or Description of Calculation: Madawaska Bridge Rating – Floorbeam Ratings				
Calc. Rev. No.	Originator	Checker	Senior Technical Reviewer (if required)	Confirmation Required (Y/N)
1	Shane M. Zeller	Eric M. Gogola		

Calculation Objective:
Determine load rating for the floorbeams of Madawaska Bridge.

Calculation Methodology/List of Assumptions:

Section Losses:
Section losses were taken from the 2017 inspection report sketches. Two (2) severe section loss cross sections and one (1) moderate section loss cross section were analyzed. The moment ratings considered the section loss to be at midspan, while the shear ratings considered the section loss to be located at stringer 2 (4'-3" from the end of floorbeam). Ratings at maximum shear points (floorbeam ends) were calculated based on full sections because no deteriorations at these locations were noted in the 2017 inspection

Member Capacities:
Moment and Shear capacities were calculated per AASHTO LRFD 6.10.8 and 6.10.9, respectively. A capacity was calculated for each section loss cross section that was analyzed.

Average flange and web thicknesses were used for capacity calculations. The average thicknesses were calculated by dividing the remaining area by the average flange width or known web depth. Floorbeam cover plate dimensions were measured during the 2017 inspection. The top flange cover plate is 5.25" wide x 0.75" thick. The bottom flange cover plate is 8" wide x 0.5" thick. These dimensions were slightly different than the values assumed in the 2012 load rating.

IES ShapeBuilder was used to determine the section modulus of each section loss cross section. The base floorbeam shape (rolled shape - I24x79.9) was input into ShapeBuilder as a plate girder to simplify the inputting of section loss to the member. The moment capacities in the rating breakdown were calculated by multiplying the section moduli and the nominal flexure resistance from the capacity calculations.

Dead Loads:
Dead loads were taken from the 2012 load rating performed by PB. The dead load shear force located at stringer 2 was found by multiplying the distance ratio from the second stringer to the end of the floorbeam (12'-0" – 4'-3" / 12'-0" ~ 65%) and the dead load shear value at the end of floorbeam.

Live Loads:
The stringers were rated for the following vehicles:

- AASHTO HL-93
- CHBDC CL-625-ONT (Canadian Vehicle)
- MaineDOT Legal Load Configurations

The vehicles were input into a 2-span planar STAAD model to determine the maximum reaction at the middle support (floorbeam). The maximum reaction from the STAAD model for the lane load was multiplied

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 2 of __

by the number of lanes and distributed along the width of the lanes (assumed to be in the center of the bridge). The maximum reaction from the STAAD model for the axle loads was divided by 2 and used as a wheel load (point load). The shear and flexure forces were calculated in Excel using the distributed load for the lane load and the point loads for the truck wheels. The wheel loads were placed to represent two trucks placed symmetrically about the center of the bridge. The live loading schematic would be a uniform load for the lane load and four point loads representing the trucks.

Factors:

The system factor, condition factor, dead load factor, live load factors, dynamic load allowance factors, and multiple presence factors are in accordance with AASHTO and CHBDC.

Inspection Report Sketches

Conclusions:

See rating summary table.

The 2012 load rating performed by PB underestimated the live load effects of the trucks on the floorbeam. PB used a single point load to represent a truck on the floorbeam. HNTB used two point loads to represent the wheels of a truck on the floorbeam. The method used by PB resulted in an ultimate moment that was 10% smaller than that of HNTB. Due to this, the updated ratings for the floorbeams are significantly worse.

INSPECTION SKETCHES

FLOORBEAM SECTIONS USED FOR LOAD RATING:

Taken from HNTB 2017 Routine and Fracture Critical Inspection

2 conditions considered: severe and moderate

NOTES:

1. SIMILAR CONDITION ON THIS FLOORBEAM AT STRINGERS S3 & S4.
2. SIMILAR LESS SEVERE CONDITION ON THIS FLOORBEAM AT STRINGERS S5 THROUGH S8.

SPAN 4, FLOORBEAM FB2S AT STRINGER S2

(Severe condition for moment and shear)

NOTES:

1. SIMILAR CONDITION AT MIDSPAN.
2. SPAN 4, FLOORBEAMS FB2N, FB3N, FB4N & FB6 AT STRINGER S2: SIMILAR LESS SEVERE CONDITION.

SPAN 4, FLOORBEAM FB5S AT STRINGER S2

(Severe condition for moment and shear)

SPAN 2, FLOORBEAM FB4N AT STRINGER S1

(Moderate condition for moment and shear)

Floorbeam Flexure Capacity - Analysis Section 1

Is the section in Positive Flexure?

Member Capacity Calculations:

Determine Web Load-Shedding Factor

$$\begin{aligned} D/t_w &= 41.63 \\ D/t_w &\leq 150 \quad \text{True} \quad \text{AASHTO 6.10.2.1.1-1} \end{aligned}$$

Does the Web satisfy AASHTO 6.10.2.1.1?

$$2D_c/t_w = 41.63$$

$$\lambda_{rw} = 5.7\sqrt{E/F_{yc}} = 177.22 \quad \text{AASHTO 6.10.1.10.2-4}$$

$$2D_c/t_w < \lambda_{rw} \quad \text{True} \quad \text{AASHTO 6.10.1.10.2-2}$$

To compute R_b use: **1.00**

$$\text{AASHTO 6.10.1.10.2-3} \quad R_b = 1 - (a_{wc}/(1200 + 300a_{wc}))(2D_c/t_w - \lambda_{rw}) < 1.0$$

$$a_{wc} = (2D_c \cdot t_w)/(b_{fc} \cdot t_{fc}) = 1.29 \quad \text{AASHTO 6.10.1.10.2-5}$$

$$R_b = 1.00$$

Determine Hybrid Factor

$$R_h = 1.00 \quad \text{AASHTO 6.10.1.10.1}$$

assumes that the web never has a yield strength less than the flanges

Determine Local buckling Resistance (FLB, Flange Local buckling)

$$\begin{aligned} \lambda_f &= b_{fc}/(2t_{fc}) = 2.03 \quad \text{AASHTO 6.10.8.2.2-3} \\ \lambda_{pf} &= 0.38\sqrt{E/F_{yc}} = 11.81 \quad \text{AASHTO 6.10.8.2.2-4} \\ \lambda_{rf} &= 0.56\sqrt{E/F_{yc}} = 17.41 \quad \text{AASHTO 6.10.8.2.2-5} \end{aligned}$$

$$\lambda_f \leq \lambda_{pf} = \text{True}$$

$$F_{yr} = \min \text{ of } (0.7F_{yc}, F_{yw}) \leq 0.5F_{yc} = 21.0 \text{ ksi} \quad \text{AASHTO 6.10.8.2.2} \quad (\text{pg 6-144})$$

$$F_{nc} = \text{AASHTO 6.10.8.2.2-1}$$

$$\text{AASHTO 6.10.8.2.2-1} \quad F_{nc} = R_b R_h F_{yc}$$

$$F_{nc(FLB)} = 30.0 \text{ ksi}$$

$$\text{AASHTO 6.10.8.2.2-2} \quad F_{nc} = \left(1 - \left(1 - \frac{F_{yr}}{R_h F_{yc}} \right) \left(\frac{\lambda_f - \lambda_{pf}}{\lambda_{rf} - \lambda_{pf}} \right) \right) R_b R_h F_{yc}$$

FLOORBEAM LOAD RATINGS

For	Madawaska Bridge Load Rating	Job No.	63738	Sheet No.	
Made by	SMZ	Checked by	EMG	Backchecked by	SMZ
Date	10/02/17	Date	10/08/17	Date	10/10/17

Floorbeam Load Ratings Information

Factors

System Factor, $\Phi_s = 0.85$ AASHTO MBE Table 6A.4.2.4-1, Floorbeams with Spacing >12 ft and Noncontinuous Stringers

Condition Factor, $\Phi_c = 0.90$ AASHTO MBE Table 6A.4.2.3-1, Poor Structural Condition per 2017 Inspection
(0.85 increased by 0.05 to 0.90 because section losses were field measured)

$\Phi_c * \Phi_s = 0.85$ (minimum 0.85 per AASHTO MBE 6A.4.2.1-3)

Dead load Factor (γ_{dc}) = 1.25 AASHTO MBE Table 6A.4.2.2-1

Live Load Factors (γ_{LL}) = 1.75 HL-93 Inventory, AASHTO MBE Table 6A.4.2.2-1

1.35 HL-93 Operating, AASHTO MBE Table 6A.4.2.2-1

1.63 CL-625-ONT Inventory, CHBDC 14.13.2.1 Table 14.8 per AASHTO LRFD C6A.1.3, Target Reliability Index, $\beta = 3.50$

1.35 CL-625-ONT Operating, CHBDC 14.13.2.1 Table 14.8 per AASHTO LRFD C6A.1.3, Target Reliability Index, $\beta = 2.50$

1.30 MaineDOT Legal Loads, AASHTO MBE Table 6A.4.2.2-1 & Table 6A.4.2.3a-1 (ADTT<1000) (See 2013 Interims)

Dynamic Load Allow Factors = 1.33 AASHTO HL-93 & MaineDOT Legal Configurations

1.25 CHBDC CL-625-ONT Truck

1.00 CHBDC CL-625-ONT Lane Load

Multiple Presence Factors = 1.00 HL-93 & MaineDOT Legal Loads, AASHTO LRFD Table 3.6.1.1.2-1 (2 lanes)

0.90 CL-625-ONT Truck & Lane Load, CHBDC Table 3.6 (2 lanes)

Capacity Information

F_{nc} & $F_{nt} = 30$ ksi (see capacity calculations)

Section Modulus, $S_{x1} = 190.80$ in³ (Minimum S_x from Analysis Section 1, IES ShapeBuilder Model)

Section Modulus, $S_{x2} = 221.40$ in³ (Minimum S_x from Analysis Section 2, IES ShapeBuilder Model)

Section Modulus, $S_{x3} = 230.70$ in³ (Minimum S_x from Analysis Section 3, IES ShapeBuilder Model)

Section Modulus, $S_{x4} = 273.40$ in³ (Minimum S_x for section without losses, IES ShapeBuilder Model)

Load Rating Considerations

Moment Member Capacity is found by multiplying the Section Modulus, S_x , and the nominal flexural resistance, F_{nc} or F_{nt} .

The CL-625-ONT has two separate configurations. The first case (Truck) is only the CL-625-ONT truck and the second case (Lane) is 80% of the CL-625-ONT truck combined with a uniform load.

From the 2017 inspection 4 typical sections were considered for evaluation.

Analysis section 1, This case considered a sever condition with moderate loss to the web and flanges plus a hole in the web, but included a repair plate.

Analysis section 2, This case considered a sever condition with moderate losses to the web and flanges but no repairs.

Analysis section 3, This case considered a moderate condition, assume minor to moderate losses to the web and flanges.

Analysis section without losses, this was considered for cases where no section losses were noted.

STRINGER LOAD RATING ANALYSIS

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 1 of __

Project: Madawaska Bridge Rating	Job No: 63738	Design Criteria Document: 1
Client: MaineDOT	Discipline: Structures	Calculation No: 1

Name or Description of Calculation: Madawaska Bridge Rating - Stringers				
Calc. Rev. No.	Originator	Checker	Senior Technical Reviewer (if required)	Confirmation Required (Y/N)
1	Shane M. Zeller	Eric Gogola		

Calculation Objective: Determine load rating for the stringers of Madawaska Bridge.

Calculation Methodology/List of Assumptions: The stringers were rated for the following vehicles: - AASHTO HL-93 - CHBDC CL-625-ONT (Canadian Vehicle) - MaineDOT Legal Load Configurations A preliminary rating was performed to compare the load ratings from STLRFD, a PennDOT program, to the previous rating done by an outside company using the analysis program, Merlin-DASH. STLRFD was determined to provide comparable results and was used to rate the stringers. STLRFD does not have an input for condition factors or system factors; therefore, these factors were calculated into a single live load factor and incorporated into the program's live load factor. While this method is slightly unconservative, the rating factors are not significantly affected because the dead load is small in proportion to the live load. The live load factors and multiple presence factor for the Canadian vehicle were taken from CHBDC. Section losses were provided via the 2017 inspection report and separated into four categories based on severity: minor, moderate, severe and critical for both shear and flexure. These losses were used to evaluate the condition of the stringers using the "Section Loss" command in STLRFD. Section losses found during the 2017 inspection are incorporated into the STLRFD analysis and ratings. Six cross sections with losses were identified for evaluation: Section 1 had extreme section losses at a stringer end. Section 2 had extreme section losses to the stringer top flange. Section 3 had severe section losses to the stringer end. Section 4 had moderate section losses to the stringer flange. Section 5 had moderate section losses to the stringer end. Section 6 had minor section losses over the entire stringer. Sections 1 & 2 are used to define a member with critical section losses. Section 1 is applied to the stringer end to define the critical shear condition and section 2 is applied to the remaining portions of the stringer to define the critical flexural conditions. Section 3 is used to define the typical severe section loss condition. These losses are applied at only the stringer end as noted in the inspection. However, the losses are significant enough to govern both shear and flexure.

HNTB	Prepared by: M. Ellis	Approved by: D. Evans	Document number: QF 06
Calculation Cover Sheet	Revision Number: 0	Revision Date: 01/22/2016	Page 2 of __

Sections 4 & 5 are used to define a member with moderate section losses. Section 5 is applied to the stringer end to define the moderate shear condition and section 4 is applied to the remaining portions of the stringer to define the moderate flexural conditions.

Section 6 is used to define the typical minor section loss condition. These losses are applied to the entire stringer as noted in the inspection. These section losses result in shear and flexure rating for the minor loss condition.

STLRFD requires slab parameters be entered for evaluation of the member. It is assumed that the steel grid deck which currently is welded at distinct locations across the length of each stringer is non-composite. Therefore, the density of the slab is set to zero so that no composite action is applied to the stringer. The dead load of the steel grid deck is applied to the stringers via the "Distributed Load" command. The stringers are considered braced at midspan following the assumption used by PB in the 2012 load rating. This assumption is supported by the fact that the steel grid deck is intermittently welded to the top flange of the stringer.

The geometry, dead loads, and distribution factors that were input into STLRFD were taken from the 2012 loading rating performed by Parsons Brinckerhoff.

SLS **Section Loss**

See Stringer Section Loss Calculations.

SLB **Slab**

STLRFD requires a concrete slab be input. Since the actual deck is non-composite steel grid, density = 0.
The steel grid deck dead load is input in the distributed load command.

Actual Slab Thickness:	5.0 in	
Effective Slab Thick:	5.0 in	
Concrete Strength:	4 ksi	
Concrete Density for Loads:	0 pcf	
Concrete Density for E _c :		default = 145 pcf
Deck Reinf Strength:		default = 60 ksi
Steel Elastic Modulus:		default = 29,000 ksi
Slab Trans Bar Size:		
Dev Len Factor Slabs:		default = 1

DPS **Deck Pour Sequence**

Stringer Section Loss Calculations

The section losses that are analyzed are broken down into four (4) categories: critical, severe, moderate, and minor. Section losses near the beam ends that affect shear are assumed to extend from the end of the stringer to 1 foot from the end of the stringer. The section losses away from the beam ends that affect flexure are assumed to run from 1 foot away from the end of the stringer to 1 foot away from the end of the stringer at the other end.

The beginning of each section loss input command in STLRFD begins with the following 4 parameters: Start Span, Start Loss Distance, End Span Number, and End Loss Distance. These parameters are filled out below for both a shear section loss location and a flexure section loss location. (There is one specific area in the critical shear section loss that only extends 3.25" from the end of the stringer - see the 2017 inspection sketches).

Shear

Start Span:	1
Start Loss Distance:	0.00 ft
End Span Number:	1
End Loss Distance:	1.00 ft

Flexure

Start Span:	1
Start Loss Distance:	1.00 ft
End Span Number:	1
End Loss Distance:	18.54 ft

The next 5 parameters are: Section Loss Element, Location, Distance, Width, and Thickness. See the sketches below for information on these dimensions.

Note that the "Distance" parameter is measured from the CL of web to the CL of section loss for plates and from the bottom of web to the CL of section loss for the webs.

Section Loss Element Key:

BP = Bottom Plate
W = Web
TP = Top Plate

Location Key

B = Bottom
T = Top
L = Left Side
R = Right Side

For section losses that are tapered, the average loss is taken across the width of the section loss.

ADDITIONAL FACTORS

For	Madawaska Bridge Load Rating	Job No.	63738	Sheet No.	
Made by	SMZ	Checked by	EMG	Backchecked by	SMZ
Date	9/22/17	Date	9/29/17	Date	9/29/17

Additional Factors for Rating Stringers (STLRFD Input)

HL-93 Runs

Condition Factor = **0.9** MBE Table 6A.4.2.3-1 (2017 Inspection Structural Condition of Poor = 0.85)
Per C6a.4.2.3, increase by 0.05 because section losses were field measured

System Factor = **1.0** Table 6A.4.2.4-1 (For Redundant Stringer Subsystems between Floorbeams)

Live Load Factors = **1.75** Strength I Inventory - Table 6A.4.2.2-1
1.35 Strength I Operating - Table 6A.4.2.2-1

Final LL Factors For STLRFD = **1.95** Inventory
1.50 Operating

The HL-93 tandem controlled over the HL-93 truck by inspection because of the increased axle loads located within the ~20 foot stringer span.

CL-625-ONT Runs

Note that STLRFD has an input under the "CTL" command for dynamic load allowance. The CL-625-ONT Truck (without the lane load) has a 1.25 dynamic load allowance factor per CHBDC 3.8.4.5.3(d). The truck with the lane load does not have a dynamic load allowance factor per CHBDC 3.8.4.5.1 (input as 1.00).

Condition Factor = **0.9** MBE Table 6A.4.2.3-1 (Poor = 0.85)
Per C6a.4.2.3, increase by 0.05 because section losses were field measured

System Factor = **1.0** Table 6A.4.2.4-1 (For Redundant Stringer Subsystems between Floorbeams)

Multiple Presence Factor = **0.9** CHBDC 3.8.4.2.1 Table 3.6 (2 lanes)

Live Load Factors **1.63** Per AASHTO LRFD C6A.1.3, Target Reliability Index, $\beta = 3.50$ (Inventory)
(CHBDC 14.13.3.1 Table 14.8) **1.35** Per AASHTO LRFD C6A.1.3, Target Reliability Index, $\beta = 2.50$ (Operating)

Final LL Factors For STLRFD = **1.63** CL-625-ONT Truck - Inventory
1.35 CL-625-ONT Truck - Operating
1.63 CL-625-ONT Lane Load - Inventory
1.35 CL-625-ONT Lane Load - Operating

MaineDOT Legal Loads

Condition Factor = **0.9** MBE Table 6A.4.2.3-1 (Poor = 0.85)
Per C6a.4.2.3, increase by 0.05 because section losses were field measured

System Factor = **1.0** Table 6A.4.2.4-1 (For Redundant Stringer Subsystems between Floorbeams)

Live Load Factors = **1.30** Strength I - Table 6A.4.2.2-1 & Table 6A.4.4.2.3a-1 (ADTT<1000)
See 2013 Interims for updated Table 6A.4.4.2.3a-1

To simplify the input, the product of the above factors will be used as the live load factors in STLRFD.

Final LL Factors For STLRFD = **1.45** Strength I

STLRFD WARNINGS/FAILURES

STLRFD Warnings/Failures:

Below is a summary of the warnings/failures from the STLRFD output that are not relevant to the outcome of the load rating. STLRFD notifies the user of input values that are outside parameters of the current standards, but does not override the input values.

GEO – Geometry

Warning: STLRFD does not allow beam/stringer spacing to be less than 3 feet.

Response: The stringer spacing is 2'-7" and should be analyzed as such.

APL – Analyze Plate

Warning: The values entered for plate dimensions are not within STLRFD's applicable range.

Response: The plate dimensions are accurately entered and should be analyzed as such.

Yield Strength Warning

Warning: The web yield strength should be greater than 36ksi or 70% flange yield strength.

Response: Yield strengths are entered based on 2012 PB load rating.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer HL-93 Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacityM+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer HL-93 Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

Maximum Factored Flexural Resistance (kip-ft) 171.46 Span Length(ft) = 19.54
 Location (ft) 18.54R

Maximum Factored Shear Resistance (kips) 98.14
 Location (ft) 1.00R

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer HL-93 Inv
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

DUCTILITY AND WEB/FLANGE PROPORTION CHECKS

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)

SHEAR CAPACITY

WEB SPECIFICATION CHECK

BEARING STIFFENER CHECK

DEFLECTION LIMITS FOR LIVE LOAD

UNCURED SLAB WEB SPECIFICATION CHECK

RATING FACTORS - STRESS FLEXURAL CAPACITY

%WARNING - <Input Post Processor>:

The specified yield strength of the web should
 be greater than the maximum of 36 ksi or 70 percent
 of the specified yield strength of the higher
 strength flange. (LRFD 6.10.1.3)

For Material ID No. 1:

Web yield of 30. ksi is less than 36. ksi

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer HL-93 Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacityM+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer HL-93 Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

 This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Truck Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacityM+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Truck Inv
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

Maximum Factored Flexural Resistance (kip-ft) 171.46 Span Length(ft) = 19.54
 Location (ft) 18.54R

Maximum Factored Shear Resistance (kips) 98.14
 Location (ft) 1.00R

NOTES:
 GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:
 M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer CL-625-ONT Truck Inv
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

Madawaska Critical Stringer CL-625-ONT Truck Inv
SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

DUCTILITY AND WEB/FLANGE PROPORTION CHECKS
STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB)
LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE)
SHEAR CAPACITY
WEB SPECIFICATION CHECK
BEARING STIFFENER CHECK
DEFLECTION LIMITS FOR LIVE LOAD
UNCURED SLAB WEB SPECIFICATION CHECK
RATING FACTORS - STRESS FLEXURAL CAPACITY
RATING FACTORS - SHEAR CAPACITY

%WARNING - <Input Post Processor>:
The specified yield strength of the web should
be greater than the maximum of 36 ksi or 70 percent
of the specified yield strength of the higher
strength flange. (LRFD 6.10.1.3)
For Material ID No. 1:
Web yield of 30. ksi is less than 36. ksi

Input Check Completed
- 6 warnings were issued.
- Please verify that the input is correct.
- The program will continue running.

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.

TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis. When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Truck Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacityM+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Truck Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

Span No.	Dist. (ft)	Flng	Limit State	Flex.	Resist. Stress Fr (ksi)	Total DL Stress (ksi)	Total LL Stress (ksi)	Rating Factor	Rating Failures**
1	18.542R	TOP	STR-I	POS.	-11.8	-2.4	-48.1	0.196*	D
1	18.565	TOP	STR-I	POS.	-11.8	-2.4	-48.1	0.196*	D

* An asterisk following the rating factor indicates that the rating is governed by lateral torsional buckling (AASHTO 6.10.8.2.3).

** Legend of Rating Failures:

- A. Section fails web proportion check
- B. Section fails one or more flange proportion checks
- C. Section fails ductility check
- D. Rating factor is less than 1.0

- A. D/tw has exceeded limit of 150 for unstiffened webs
- B. D/tw has exceeded limit of 300 for stiffened webs
- C. Rating factor is less than 1.0

 Madawaska Critical Stringer CL-625-ONT Truck Oper
 SUMMARY - OVERALL REACTIONS

REACTIONS & ROTATIONS PER GIRDER (UNFACTORED, W/O IMPACT, W/ DISTRIBUTION)
 FOR ELASTOMERIC BEARING PAD DESIGN

Support No.		Minimum Reaction LC (kips)	Maximum Reaction LC (kips)	Live Load Rotation LC (radians)
1	Total DC1	0.87	0.87	
	Total DL	0.87	0.87	
	LL (SPECIAL #1)	0.00	35.27	0.004168
2	Total DC1	0.87	0.87	
	Total DL	0.87	0.87	
	LL (SPECIAL #1)	0.00	35.27	0.004168

Note: Rotation is about an axis normal to the centerline of the beam.
 The rotation value given is the larger of the positive
 rotation and absolute value of the negative rotation due
 to live load.

 Madawaska Critical Stringer CL-625-ONT Truck Oper
 SUMMARY - OVERALL REACTIONS (cont.)

REACTIONS & ROTATIONS PER GIRDER (UNFACTORED, W/ IMPACT, W/ DISTRIBUTION)
 FOR POT, STEEL OR DISC BEARING DESIGN

Support No.		Minimum Reaction LC (kips)	Maximum Reaction LC (kips)	Rotation LC (radians)
1	Total DC1	0.87	0.87	-0.000311
	Total DL	0.87	0.87	-0.000311
	LL (SPECIAL #1)	0.00	44.09	-0.005210
2	Total DC1	0.87	0.87	0.000311
	Total DL	0.87	0.87	0.000311
	LL (SPECIAL #1)	0.00	44.09	0.005210

Note: Rotation is about an axis normal to the centerline of the beam.

Madawaska Critical Stringer CL-625-ONT Truck Oper
SUMMARY - OVERALL REACTIONS (cont.)

REACTIONS (UNFACTORED) FOR ABUTMENT DESIGN

DL REACTIONS (UNFACTORED) PER GIRDER

Support No.		Minimum Reaction (kips)	Maximum Reaction (kips)
1	Total DC1	0.87	0.87
	Total DL	0.87	0.87
2	Total DC1	0.87	0.87
	Total DL	0.87	0.87

LL REACTIONS PER LANE (UNFACTORED, W/O IMPACT)

Support No.		Minimum Reaction (kips)	Maximum Reaction (kips)
1	SPECIAL #1	0.00	58.78
2	SPECIAL #1	0.00	58.78

Note: These values are to be used only if the end supports are abutments. Do not use these values for the pier design at a discontinuous superstructure.

 Madawaska Critical Stringer CL-625-ONT Truck Oper

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer CL-625-ONT Truck Oper
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA

WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY

ECONOMIC FEASIBILITY CHECKS

Madawaska Critical Stringer CL-625-ONT Truck Oper
SUMMARY - SPECIFICATION CHECKS (cont.)

SPECIFICATION CHECK FAILURES

For the live loadings input by the user, the program encountered one or more specification check failures. The following is a list of output table headings, listed separately for each live loading for which failures have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

DUCTILITY AND WEB/FLANGE PROPORTION CHECKS

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

 This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Lane Inv
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange

(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr

F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity

M+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Lane Inv
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

 Location (ft) 1.00R

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA
WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY
ECONOMIC FEASIBILITY CHECKS

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

 This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

SPECIAL #1 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
Dt = Total depth of the composite section (A6.10.7.1.2)
Rh = Hybrid factor (A6.10.1.10.1)
Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
Dc = Total depth of the web in compression, per Appendix D6.3.1
Myt = Yield moment to the top flange, per Appendix D6.2
Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
F. Discretely braced tension flange governs (App A A6.1.2)
G. Continuously braced compression flange governs (App A A6.1.3)
H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Lane Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

*** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either flange under uniform bending with consideration of compression-flange residual stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacityM+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer CL-625-ONT Lane Oper
SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
 USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
 LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
 LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
 S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer CL-625-ONT Lane Oper
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA
WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY
ECONOMIC FEASIBILITY CHECKS

* Legend of General Notes:

TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user input lateral loads have been entered.

* Legend of General Notes:

N/A* = Since the flexural capacity at this analysis point, limit state, flexure state and flange is moment-governed, the total factored flexural stress is not used for any specification checks and therefore is not applicable.

N/A** = This check is not required or not applicable at this analysis point, limit state, and flexure state.

FACTORED LATERAL STRESSES

This output report is not applicable because no lateral loads (wind or user input lateral loads) have been entered.

INTERMEDIATE VALUES FOR MOMENT FLEXURAL CAPACITY CALCULATIONS (cont.)

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, FrF+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
(Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
flange under uniform bending with consideration of compression-flange residual
stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier

(Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange

(Article A6.2.1 or A6.2.2)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = $f_{bu} + (1/3) \cdot f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If F+ prints as N/A, Appendix A calculations govern the LTB capacity

M+ = $M_u + (1/3) \cdot f_l \cdot S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #1 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

*** Legend of Code Check:

- A. Insufficient flexural resistance
- B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.
- C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

* Legend of General Notes:

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from the stress flexural resistance, Fr

Fu = For bottom flanges of composite sections or both flanges of noncomposite sections, this value includes lateral stresses when input by the user (A6.10.4.2.2)

** Legend of Resistance Calculation:

A. Composite, top flange, Fr calculated using A6.10.4.2.2-1

B. Composite, bottom flange, Fr calculated using A6.10.4.2.2-2

C. Noncomposite, Fr calculated using A6.10.4.2.2-3

* Legend of Intermediate Calculations:

Dc = Depth of web in compression

Rh = Hybrid factor

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fcrw

Fcrw = Nominal bend-buckling resistance, LRFD Specifications 6.10.4.2.2-4

fc = Compression-flange stress calculated without flange lateral bending

N/A = This check is not required for composite sections in positive
flexure in which the web satisfies the requirement of LRFD
Specifications Article 6.10.2.1.1

 SPECIAL #2 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
 TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
 TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
 When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
 input lateral loads have been entered.

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #2 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier
 (Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

$M_r(e)$ = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, F_r

$F+$ = $f_{bu} + (1/3)*f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If $F+$ prints as N/A, Appendix A calculations govern the LTB capacity

$M+$ = $M_u + (1/3)*f_l*S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If $M+$ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for $F+$ or $M+$ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress ($F+$) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress ($F+$) to the flexural resistance (F_r) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

Madawaska Critical Stringer MaineDOT Trucks 1-4
SPECIAL #3 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
input lateral loads have been entered.

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #3 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

 SPECIAL #3 - SPECIFICATION CHECKING (cont.)

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier
 (Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

Madawaska Critical Stringer MaineDOT Trucks 1-4
SPECIAL #3 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. F_r calculated using AASHTO Equation 6.10.8.2.3-1

B. F_r calculated using AASHTO Equation 6.10.8.2.3-2

C. F_r calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. M_r calculated using AASHTO Equation A6.3.3-1

E. M_r calculated using AASHTO Equation A6.3.3-2

F. M_r calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

$M_r(e)$ = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, F_r

$F+$ = $f_{bu} + (1/3)*f_l$, total factored flexural + lateral stress due to wind (per
A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
If $F+$ prints as N/A, Appendix A calculations govern the LTB capacity

$M+$ = $M_u + (1/3)*f_l*S_{xt}$, total factored flexural + lateral moment due to wind or user
input effects, A6.10.7.1.1-1

If $M+$ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for $F+$ or $M+$ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress ($F+$) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress ($F+$) to the flexural resistance (F_r) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
(wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

SPECIAL #4 - ANALYSIS (cont.)

UNFACTORED FLEXURAL STRESSES (cont.)

* Legend of General Notes:
TOTAL DC1 INST = the total DC1 stress assuming instantaneous placement of the deck slab and haunch.
TOTAL DC1 DECK POUR = the total DC1 stress at the end of the deck pour analysis.
When computing the total factored stress, STLRFD uses the total DC1 stress (either instantaneous or deck pour) that causes the largest stress in the flanges.

USER INPUT LATERAL STRESSES

This output report is not applicable because no user
input lateral loads have been entered.

* Legend of General Notes:

- Dp = Distance from top of concrete deck to neutral axis of the composite section at the plastic moment (A6.10.7.1.2)
- Dt = Total depth of the composite section (A6.10.7.1.2)
- Rh = Hybrid factor (A6.10.1.10.1)
- Rpc = Web plastification factor for the compression flange (App A A6.2.1-4 or A6.2.2-4)
- Rpt = Web plastification factor for the tension flange (App A A6.2.1-5 or A6.2.2-5)
- Dc = Total depth of the web in compression, per Appendix D6.3.1
- Myt = Yield moment to the top flange, per Appendix D6.2
- Myb = Yield moment to the bottom flange, per Appendix D6.2

** Legend of Resistance Calculation:

Compact Section:

- A. $Dp \leq 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-1
- B. $Dp > 0.1 \cdot Dt$, Mn calculated using A6.10.7.1.2-2
- C. Continuous span, Mn calculated using A6.10.7.1.2-3

Appendix A:

- D. Discretely braced compression flange, local buckling governs (App A A6.3.2-1)
- E. Discretely braced compression flange, local buckling governs (App A A6.3.2-2)
- F. Discretely braced tension flange governs (App A A6.1.2)
- G. Continuously braced compression flange governs (App A A6.1.3)
- H. Continuously braced tension flange governs (App A A6.1.4)

* Legend of General Notes:

Rh = Hybrid factor

Rb = Load shedding factor (only applies to compression flange)

Mr(e) = Flexural resistance in terms of moment, back-calculated from
from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress
due to wind (per A6.10.7.2.1-2, A6.10.8.1.1-1, or
A6.10.8.1.2-1) and/or user input lateral effects

w = Value for F+ includes lateral load effects

Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #4 - SPECIFICATION CHECKING (cont.)

STRESS FLEXURAL CAPACITY (NONCOMPOSITE OR -FLEX OR COMPOSITE/NONCOMPACT, NO LTB) (cont.)

** Legend of Resistance Calculation:

Composite Section in Positive Flexure, Noncompact Section:

A. Compression flange governs, Fr calculated using A6.10.7.2.2-1

B. Tension flange governs, Fr calculated using A6.10.7.2.2-2

Composite Section in Negative Flexure or Noncomposite Section:

C. Compression flange governs, Fr calculated using A6.10.8.1.3-1

D. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-1

E. Compression flange governs, Fr calculated using FLB, A6.10.8.2.2-2

F. Tension flange governs, Fr calculated using A6.10.8.1.3-1

G. Tension flange governs, Fr calculated using A6.10.8.3-1

H. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable.

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

INTERMEDIATE VALUES FOR LATERAL TORSIONAL BUCKLING CALCULATIONS (cont.)

* Legend of General Notes:

Values that are the same for Article 6.10.8.2.3 and Appendix A

rt = Effective radius of gyration for lateral torsional buckling
 (Equations 6.10.8.2.3-9 or A6.3.3-10)

Rh = Hybrid factor (Article 6.10.1.10.1)

Rb = Load shedding factor (Article 6.10.1.10.2)

Dc = Depth of the web in compression (Article D6.3.1)

Lp = Limiting unbraced length to achieve the nominal flexural resistance of RbRhFyc
 under uniform bending (Equations 6.10.8.2.3-4 or A6.3.3-4)

Values that are different for Article 6.10.8.2.3 and Appendix A

Lr = Limiting unbraced length to achieve the onset of nominal yielding in either
 flange under uniform bending with consideration of compression-flange residual
 stress effects (Equations 6.10.8.2.3-5 or A6.3.3-5)

Cb = Moment gradient modifier
 (Equations A6.10.8.2.3-6, A6.10.8.2.3-7, A6.3.3-6, or A6.3.3-7)

Values that are specific to Appendix A

Myc = Yield moment with respect to the compression flange (Article D6.2)

Rpc = Web plastification factor for the compression flange
 (Article A6.2.1 or A6.2.2)

 Madawaska Critical Stringer MaineDOT Trucks 1-4
 SPECIAL #4 - SPECIFICATION CHECKING (cont.)

LATERAL TORSIONAL BUCKLING CAPACITY (NONCOMPOSITE OR NEGATIVE FLEXURE) (cont.)

* Legend of Resistance Calculation:

LRFD Specifications Article 6.10.8.2.3

A. Fr calculated using AASHTO Equation 6.10.8.2.3-1

B. Fr calculated using AASHTO Equation 6.10.8.2.3-2

C. Fr calculated using AASHTO Equation 6.10.8.2.3-3

LRFD Specifications Chapter 6, Appendix A

D. Mr calculated using AASHTO Equation A6.3.3-1

E. Mr calculated using AASHTO Equation A6.3.3-2

F. Mr calculated using AASHTO Equation A6.3.3-3

G. Girder skew angle has not been entered. Appendix A provisions have not been checked, but may be applicable

H. Appendix A provisions are not applicable at this location

** Legend of General Notes:

Mr(e) = Flexural resistance in terms of moment, back-calculated from
 from the stress flexural resistance, Fr

F+ = fbu + (1/3)*fl, total factored flexural + lateral stress due to wind (per
 A6.10.7.2.1-2, A6.10.8.1.1-1, or A6.10.8.1.2-1) and/or user input lateral effects
 If F+ prints as N/A, Appendix A calculations govern the LTB capacity

M+ = Mu + (1/3)*fl*Sxt, total factored flexural + lateral moment due to wind or user
 input effects, A6.10.7.1.1-1

If M+ prints as N/A, 6.10.8.2.3 calculations govern the LTB capacity

w = Value for F+ or M+ includes lateral load effects

*** Legend of Code Check:

A. Insufficient flexural resistance

B. Based on the total stress in the bottom flange, this section is analyzed for positive flexure, so the top flange capacity is based on compression. However, the total factored stress (F+) in the top flange is tensile. The user should verify the acceptability of the section by comparing the top flange stress (F+) to the flexural resistance (Fr) of the top flange in negative flexure.

C. The unbraced range containing this analysis point varies in depth and has a flange transition more than one foot away from the ends of the unbraced range.

FLANGE LATERAL CAPACITY

This output report is not applicable because no lateral loads
 (wind or user input lateral loads) have been entered.

NET SECTION FRACTURE CHECK

Not applicable due to absence of section holes

OVERALL RATING SUMMARY W/O FWS (cont.)

BRIDGE LOAD RATINGS W/O FWS (cont.)

NOTES:

GIVEN DISTRIBUTION FACTOR IS THE VEHICULAR LIVE LOAD DISTRIBUTION FACTOR
USED TO PRODUCE THE GIVEN RATING. FOR THE STR-IP LIMIT STATE, THE VEHICULAR
LIVE LOAD DISTRIBUTION FACTOR ACCOUNTS FOR THE PRESENCE OF PEDESTRIAN
LOADS, IF APPLICABLE.

ALL RATINGS ARE BASED ON THE EXCLUSION OF THE DESIGN FUTURE WEARING SURFACE.

SYMBOL DESIGNATION FOR RATING FACTORS:

M - MOMENT RATING FACTOR CONTROLS
S - SHEAR RATING FACTOR CONTROLS

Madawaska Critical Stringer MainedOT Trucks 1-4
SUMMARY - SPECIFICATION CHECKS

SPECIFICATION CHECK WARNINGS

For the live loadings input by the user, the program encountered one or more specification check warnings. Specification check warnings indicate conditions that do not fail a specification check, but may need to be reviewed by the user. The following is a list of output table headings, listed separately for each live loading for which warnings have occurred. It should be noted that the program does not perform specification checking corresponding to commands that have not been input by the user.

SPECIAL #1

COMPACTNESS CRITERIA
WEB-TO-FLANGE WELD DESIGN: WELD CAPACITY
ECONOMIC FEASIBILITY CHECKS

SPECIAL #2
