Wetland Delineation Report

Introduction

On behalf of the Maine Department of Transportation (MaineDOT), Vanasse Hangen Brustlin, Inc. (VHB) conducted wetland and waterbody site reconnaissance, wetland delineation and surveys for potential vernal pools within a study area located on Sears Island in Searsport, Maine (Study Area or Site). The purpose of this report is to describe delineated wetland and water resources within the Study Area that may fall under the jurisdiction of the U.S. Army Corps of Engineers (USACE) and the Clean Water Act (CWA) and under the jurisdiction of the Maine Natural Resources Protection Act (NRPA).

VHB conducted wetland and waterbody field investigations during multiple site visits in March of 2022 and August and September of 2023. In addition to describing identified wetland resource areas, this report describes existing conditions within the Study Area and the methodologies employed for identification of wetlands and water resources at the Site. Please see Appendix 1 – USGS Site Location Map and Appendix 2 – Natural Resource Mapping for an overview of the Study Area and the wetlands and natural resources identified at the Site.

Existing Site Conditions

The Study Area is approximately 230 acres in size and located within Sears Island, an island within Searsport Harbor, connected via a constructed causeway to the mainland of Searsport, Maine. The Study Area consists of a portion of an existing MaineDOT owned parcel, currently zoned as Transportation/Marine Development (Town of Searsport Parcel: Map 8/Lots 1 and 1-A).

The Study Area consists largely of undeveloped and forested land. The approximate center of the Study Area is 44.443236° north latitude and 68.887058° west longitude. Topography generally slopes to the west across the Study Area, with the highest elevations present in the center of the island. Elevations across the Study Area range from sea level to approximately 200 FT above sea level at the highest point. The only named waterbody proximate to the Study Area is Searsport Harbor along the western shoreline. USGS topographic mapping shows two USGS-designated intermittent streams mapped within the northern extent of the Study Area. The hydrologic characteristics of the Site are largely driven by drainages which form gullies and low areas where wetlands or intermittent streams drain west/northwest downslope to the water's edge.

The Study Area includes Sears Island Road (also named Stetson Hills Lane) which is a paved and gravel surface road that provides access to the island from the mainland. The road enters the island from the north and then bends in a westerly direction until it ends at the west shoreline of the mid-island. The area at the west extent of the road includes cleared fields and evidence of previous development activities including remnant stormwater features. There is also a large constructed wetland restoration area present in this portion of the Site. The remainder and large majority of the Study Area is forested and shows evidence of previous human disturbance interspersed throughout its extent. Please see Appendix 3 – Site Photographs for representative photos of the Study Area.

Soils Within the Study Area

Soil survey mapping by the Natural Resources Conservation Service (NRCS) indicates that the Study Area contains seven (7) soil designations (See Appendix 4 – NRCS Soils Map). According to the published USDA-NRCS soil survey data, 54 percent of the soils consist of Peru fine sandy loam, 23 percent consist of Marlow fine sandy loam, 13 percent consist of Boothbay silt loam, 3 percent consist of Brayton fine sandy loam or Swanville silt loam, and then less than 1 percent consist of Masardis variant fine sandy loam (very rocky). Please see Appendix 4 – NRCS Soil Mapping for additional information.

FEMA Flood Zone Designations

According to the Flood Insurance Rate Map (FIRM) Number 23027C0459E, published by FEMA and made effective on July 5, 2015, portions of the Study Area fall within Zones VE, AE, and X. The boundary of these three zones generally follow the shoreline, with the VE zone outward of the shoreline and the AE zone inland of the shoreline. The large majority of the site is located in Zone X and is outside of the coastal flood zone. The FEMA FIRM is included in Appendix 5. The three zones are defined as follows:

VE Zone (Site Base Flood Elevation – EL. 15 FT NAVD88): A coastal hazard area subject to high velocity water including waves; this area is defined by the 1% annual chance (base) flood limits (also known as the 100-year flood) and wave effects 3 FT or greater. The hazard zone is mapped with base flood elevations (BFEs) that reflect the combined influence of still-water flood elevations, primary frontal dunes, and wave effects 3 Ft or greater.

AE Zone (Site Base Flood Elevations – EL. 13 FT NAVD88): A hazard zone area within the 100-year flood limits defined with BFEs that reflect the combined influence of still-water flood elevations and wave effects less than 3 FT.

X Zone (Site Average Flood Elevation) – N/A): An area determined to be outside the 0.2% annual chance floodplain.

Methodology

Wetlands

Environmental Scientists from VHB conducted wetland delineations in March of 2022 and August and September of 2023. VHB delineated the boundary of wetlands in accordance with the *Army Corps of Engineers 1987 Wetland Delineation Manual* (1987 Manual) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (Version 2.0)* (Regional Supplement). All wetland delineations were conducted using Routine Determination Methods, which require that a wetland must contain a dominance of hydrophytic vegetation, hydric soils and evidence of hydrology to be considered a wetland. Wetland boundaries were demarcated with flagging and flag locations were recorded using a Trimble® GPS unit capable of sub-meter accuracy, post-processed and incorporated onto the Study Area Natural Resource mapping.

Field notes were taken to record the classification of wetlands in accordance with the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin Classification), for the purposes of U.S. Army Corps of Engineers Wetland Determination Data Forms, and to note general site characteristics and any unique site features observed during the delineation.

Waterbodies and Waterways

VHB also evaluated the site for the presence or absence of waterbodies and waterways. Streams were evaluated in accordance with NRPA criteria and definitions. A river, stream or brook is defined by NRPA in Title 38 M.R.S.A. § 480- A as a channel between defined banks. The channel is created by surface water and has two or more of the following five characteristics:

- The channel is depicted as a solid or broken line on the most recent addition of the U.S. Geological Survey 7.5-minute series topographic map, or 15-minute series topographic map if the 7.5 minute series is unavailable;
- The channel contains or is known to contain flowing water continuously for a period of at least 6 months of the year in most years;
- The channel bed is primarily composed of mineral material such as sand and gravel, parent material or bedrock that has been deposited or scoured by water;
- The channel contains aquatic animals such as fish, aquatic insects or mollusks in the water or, if no surface water is present, the stream bed;
- The channel contains aquatic vegetation and is essentially devoid of upland vegetation.

The Army Corps General Permit does not include a definition of river, stream or brook. However, the ordinary highwater mark (OHW) of watercourses was identified following USACE's Regulatory Guidance Letter No. 05-05 Ordinary High water Mark Identification (2005).

Vernal Pools

During the course of the wetland delineation field work, VHB scientists also evaluated the property for the presence of potential vernal pool features that may be regulated by Maine DEP and the USACE. Please see below for more information on vernal pool regulations in the State of Maine.

The Maine DEP defines “vernal pools, also referred to as seasonal forested pools, as natural temporary to semi-permanent bodies of water that occur in shallow depressions that typically fill with water during the spring or fall and may dry during the summer. Vernal pools have no permanent inlet or outlet and have no viable populations of predatory fish. A vernal pool may provide the primary breeding habitat for wood frogs (*Rana sylvatica*), spotted salamanders (*Ambystoma maculatum*), blue-spotted salamanders (*Ambystoma laterale*), and fairy shrimp (*Eubranchipus sp.*), as well as valuable habitat for other plants and wildlife, including several rare, threatened, and endangered species. A vernal pool intentionally created for the purposes of compensatory mitigation is included in this definition.”

DEP further differentiates vernal pools as ‘significant’ (regulated under NRPA) and ‘non-significant’ (not regulated under NRPA). Significant vernal pool habitat consists of vernal pools depression and that portion of the critical terrestrial habitat within 250 feet of the spring or fall high water mark of the depression. Whether a vernal pool is a significant vernal pool is determined by the number and type of pool-breeding amphibian egg masses in a pool, the presence of fairy shrimp, or use by certain rare, threatened or endangered species that commonly requires a vernal pool to complete a critical portion of its life-history as specified in NRPA A Chapter 335 Significant Wildlife Habitat Rules Section 9(B). Table 1 identifies the Chapter 335 abundance criteria required for wood frogs (*Rana sylvatica*), spotted salamanders (*Ambystoma maculatum*), blue-spotted salamanders (*Ambystoma laterale*), fairy shrimp (*Eubranchipus sp.*) and certain state-listed species to define an area as a significant vernal pool.

Species	Abundance Criteria
Fairy shrimp	Presence in any life stage.
Blue spotted salamanders	Presence of 10 or more egg masses.
Spotted salamanders	Presence of 20 or more egg masses.
Wood frogs	Presence of 40 or more egg masses.
Certain rare, threatened, or endangered species ¹	Presence
¹ Per NRPA Chapter 335 Section 9(B), examples of vernal pool dependent state-listed endangered or threatened species include, but are not limited to, Blanding’s turtle (<i>Emydoidea blandingii</i>), spotted turtle (<i>Clemmys guttata</i>), and ringed boghaunter dragonflies (<i>Williamsonia lintneri</i>). The rare species that must be considered are limited to: wood turtle (<i>Glyptemys insculpta</i>), ribbon snake (<i>Thamnophis sauritus</i>), swamp darner dragonflies (<i>Epiaschna heros</i>), and comet darner dragonflies (<i>Anax longipes</i>).	

The USACE Maine General Permit (GP) applies a different definition of 'vernal pool' and states "the State of Maine, Department of Environmental Protection has specific protections for VPs. For the purposes of these GPs, VPs are depressional wetland basins that typically go dry in most years and may contain inlets or outlets, typically of intermittent flow. Vernal pools range in both size and depth depending upon landscape position and parent material(s). In most years, VPs support one or more of the following obligate indicator species: wood frogs (*Rana sylvatica*), spotted salamanders (*Ambystoma maculatum*), blue-spotted salamanders (*Ambystoma laterale*), and fairy shrimp (*Eubranchipus* sp.). However, they should preclude sustainable populations of predatory fish."

General Condition 20. Vernal Pools of the Department of the Army General Permits for the State of Maine states the following:

- A Preconstruction Notification (PCN) is required if a discharge of dredged or fill material is proposed within a vernal pool depression located within waters of the U.S.
- GC 20(a) above does not apply to projects that are within a municipality that meets the provisions of a Corps-approved vernal pool Special Area Management Plan (SAMP) and are otherwise eligible for SV, and the applicant meets the requirements to utilize the vernal pool SAMP.

At its discretion, the Corps may determine during permit review that a waterbody should or should not be regulated as a vernal pool based on available evidence. The USACE does not differentiate vernal pools as 'significant' or 'non-significant' based on the abundance of biological indicators. As stated in the USACE definition, the presence of any of the specified indicator species in any abundance qualifies a feature as a regulated vernal pool. An additional important distinction between the USACE and the Maine DEP definition of vernal pools is that under the Maine DEP rules, a vernal pool must be 'natural' in origin, where under the USACE rules a vernal pool may be natural or manmade.

Study Results

Using the methodologies and criteria described above, VHB conducted wetland resource area evaluations and delineations within the Study Area. The following subsections provide a description of identified wetland areas and types.

Freshwater Wetlands

VHB identified a network of vegetated freshwater wetlands within the Study Area. Delineated freshwater wetlands within the Study Area fall into three main categories: palustrine forested (PFO), palustrine scrub-shrub (PSS) and palustrine emergent (PEM) wetlands. Several wetlands were associated with or contained intermittent streams.

Palustrine Forested Wetlands

The palustrine forested wetlands consist of a mixture of broad-leaved deciduous species along needle-leaved evergreen species, 6 meters or taller. Woody species commonly observed include red maple (*Acer rubra*), balsam fir (*Abies balsamea*), speckled alder (*Alnus incana*) and yellow birch (*Betula alleghaniensis*). The forest floor and low-lying vegetation included skunk cabbage (*Symplocarpus foetidus*), cinnamon fern (*Osmunda cinnamomea*) and New York fern (*Parathelypteris noveboracensis*).

Palustrine Scrub-Shrub Wetlands

The palustrine scrub-shrub wetlands are dominated by broad-leaved deciduous species with some needle-leaved evergreen species also present, less than 6 meters tall. Woody species commonly observed include speckled alder, winter berry (*Ilex verticillata*), witch hazel (*Hamamelis virginiana*) along the fringes of wetland areas, as well as balsam fir and red maple saplings.

Palustrine Emergent Wetlands

Emergent wetlands are characterized by erect, herbaceous hydrophytes, excluding mosses and lichens (Cowardin et al. 1979). Portions of wetlands that VHB delineated within the Study Area may be categorized as emergent wetlands. Common species include cattail (*Typha sp.*), common reed (*Phragmites australis*) and reed canary grass (*Phalaris arundinacea*). The PEMs identified within the Study Area were all associated with the on-site constructed wetland restoration area in the central portion of the Study Area.

Wetlands Of Special Significance

Wetlands of Special Significance (WOSS) are defined in NRPA Chapter 310: Wetlands and Waterbodies Protection Section 4. According to Chapter 310, WOSS include all coastal wetlands and great ponds, and freshwater wetlands that exhibit one or more of the following characteristics:

- “(1) Critically imperiled or imperiled community. The freshwater wetland contains a natural community that is critically imperiled (S1) or imperiled (S2) as defined by the Natural Areas Program.
- (2) Significant wildlife habitat. The freshwater wetland contains significant wildlife habitat as defined by 38 M.R.S.A. § 480-B (10).
- (3) Location near coastal wetland. The freshwater wetland area is located within 250 feet of a coastal wetland.
- (4) Location near GPA great pond. The freshwater wetland area is located within 250 feet of the normal high water line, and within the same watershed, of any lake or pond classified as GPA under 38 M.R.S.A. § 465-A.
- (5) Aquatic vegetation, emergent marsh vegetation or open water. The freshwater wetland contains under normal circumstances at least 20,000 square feet of aquatic vegetation, emergent marsh vegetation or open water, unless the 20,000 or more square foot area is the result of an artificial ponds or impoundment.

- (6) Wetlands subject to flooding. The freshwater wetland area is inundated with floodwater during a 100-year flood event based on flood insurance maps produced by the Federal Emergency Management Agency or other site-specific information.
- (7) Peatlands. The freshwater wetland is or contains peatlands, except that the department may determine that a previously mined peatland, or portion thereof, is not a wetland of special significance.
- (8) River, stream or brook. The freshwater wetland area is located within 25 feet of a river, stream or brook."

WOSS identified within the Study Area are shown in the Natural Resources Maps in Appendix 2. Wetlands that met the NRPA WOSS criteria included wetlands located within 250 feet of a coastal wetland (Criteria 3) and wetlands within 25 feet of a river, stream or brook (Criteria 8).

Freshwater Waterbodies

VHB identified five separate intermittent streams within the Study Area during the delineation effort that met the NRPA stream definition criteria as described above. These streams are shown on the Natural Resources Maps in Appendix 2.

Vernal Pools

VHB did not identify any potential vernal pools within the Study Area.

Coastal Wetlands

The western and northern portions of the Study Area border the shoreline of Sears Island and therefore include or are proximate to areas of marine/coastal wetlands. Under NRPA, coastal wetlands include the following:

"Coastal Wetlands" means all tidal and subtidal lands; all areas with vegetation present that is tolerant of salt water and occurs primarily in salt water or estuarine habitat; and any swamp, marsh, bog, beach, flat or other contiguous lowland that is subject to tidal action during the highest tide level for each year in which an activity is proposed in tide tables published by the National Ocean Service. Coastal wetlands may include portions of coastal sand dunes.

These coastal wetland areas were not field delineated as part of the wetland delineation effort but may be subject to NRPA and Section 10 of the Rivers and Harbors Act of 1899 which governs work impacting navigable waters. The coastal wetlands within or proximate to the Sears Island Study Area include marsh, beach, tidal flats and subtidal areas. Additionally, according to Maine Natural Areas Program (MNAP), the northwestern shore of the Study Area includes a section of mapped Dune Grassland, which is an MNAP Exemplary Natural Community (State Rank: S2), as well as mapped Sand Dune area according to the Maine Sand Dune Boundaries GIS layer. See the Natural Resources Maps in Appendix 2 for additional information.

Wetland Functions and Values

The functions and values of a wetland are determined based on a descriptive, best professional judgment approach, with reference to the methodology recommended by the U.S. Army Corps of Engineers New England District - *The Highway Methodology Workbook Supplement: Wetland Functions and Values - A Descriptive Approach*. Thirteen wetland functions and values are recognized under the USACE methodology:

- Groundwater Recharge/Discharge;
- Floodflow Alteration (Storage & Desynchronization);
- Fish and Shellfish Habitat;
- Sediment/Toxicant Pathogen Retention;
- Nutrient Removal/Retention/Transformation;
- Production Export (Nutrient);
- Sediment/Shoreline Stabilization;
- Wildlife Habitat;
- Recreation (Consumptive & Non-Consumptive);
- Educational/Scientific Value;
- Uniqueness/Heritage;
- Visual Quality/Aesthetics; and,
- Threatened or Endangered Species Habitat.

The USACE Highway Methodology provides a list of considerations and qualifiers that are used to assess the occurrence of each function or value, followed by a subjective determination of Principal Functions and Values.

The principal wetland functions and values associated with the wetlands identified in this Study Area are: Groundwater recharge and discharge; fish & shellfish habitat, nutrient removal/retention/transformation; production export (nutrient); sediment/shoreline stabilization; wildlife habitat; recreation; educational/scientific value; and visual quality/aesthetics.

Summary

The information contained in this report was collected to provide an overview of wetland, waterbody, and potential vernal pool resources falling under the jurisdiction of the USACE and the Maine DEP within the specific Sears Island Study Area surveyed by VHB. These features may

be regulated by the USACE under the Clean Water Act, and by the Maine DEP under the Natural Resources Protection Act.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Waldo County, Maine

Survey Area Data: Version 22, Aug 30, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 11, 2021—Oct 29, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
Be	Beaches	2.1	1.0%
BoB	Boothbay silt loam, 3 to 8 percent slopes	27.8	13.0%
BvB	Brayton fine sandy loam, 0 to 8 percent slopes, very stony	7.3	3.4%
EIB	Eldridge fine sandy loam, 3 to 8 percent slopes	1.7	0.8%
MbC	Marlow fine sandy loam, 8 to 15 percent slopes	3.3	1.5%
MeC	Marlow fine sandy loam, 8 to 15 percent slopes, very stony	46.6	21.7%
MrB	Masardis variant fine sandy loam, very rocky, 3 to 8 percent slopes	0.3	0.1%
PbB	Peru fine sandy loam, 0 to 8 percent slopes, very stony	63.0	29.3%
PbC	Peru fine sandy loam, 8 to 15 percent slopes, very stony	53.9	25.1%
Sw	Swanville silt loam, 0 to 3 percent slopes	5.9	2.7%
W	Water bodies	3.0	1.4%

Appendix 5 – FEMA FIRM

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The community map repository should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations (BFEs)** and/or **footways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Shoreline Elevation Tables contained within the Flood Insurance Study (FIS) Report that accompanies the FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only to landward of 0.0 North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Shoreline Elevation Tables in the Flood Insurance Study Report for this jurisdiction. Elevations shown in the Summary of Shoreline Elevation Tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **footways** were computed at cross sections and interpolated between cross sections. The footways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Footway widths and other pertinent footway data are provided in the Flood Insurance Study Report for this jurisdiction.

The AE Zone category has been divided by a **Limit of Moderate Wave Action (LMWA)**. The LMWA represents the approximate landward limit of the 1.5-foot breaking wave. The effects of wave hazards between the VE Zone and the LMWA (or between the shoreline and the LMWA for areas where VE Zones are not identified) will be similar to, but less severe than those in the VE Zone.

Certain areas not in Special Flood Hazard Areas may be protected by **lood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM zone 18). The **horizontal datum** was NAD 83, GRS 1980 epoch, differences in datum, spheroid projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same vertical datum. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at <http://www.ngs.noaa.gov> or contact the National Geodetic Survey at the following address:

NGS Information Services
 NOAA, NAD83/2
 National Geodetic Survey
 SSMC-3, #0202
 1315 East-West Highway
 Silver Spring, Maryland 20910-3282
 (301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242, or visit its website at <http://www.ngs.noaa.gov>.

Base map information shown on the Flood Insurance Rate Map (FIRM) was derived from the Maine Office of GIS (MEGIS) produced at a scale of 1:2,000, from aerial photography dated 2005, or later.

The **profile baselines** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the **profile baselines** in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses, and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels in which each community is located.

For information on available products associated with this FIRM, visit the **Map Service Center (MSC)** website at <http://msc.fema.gov>. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products, or the National Flood Insurance Program in general, please call the **FEMA Map Information Exchange (FMIX)** at 1-877-FEMA-MAP (1-877-366-6277) or visit the FEMA website at <http://www.fema.gov/business/fip>.

State of Maine Floodway Note: Under the Maine Revised Statutes Annotated (M.R.S.A.) Title 26 § 439-A, 7C where the floodway is not designated on the Flood Insurance Rate Map, the floodway is considered to be the channel of a river or other water course and the adjacent land areas to a distance of one-half the width of the floodplain, as measured from the normal high water mark to the upland limit of the floodplain, unless a technical evaluator certified by a registered professional engineer is provided demonstrating the actual floodway based upon approved FEMA modeling methods.

Only coastal structures that are certified to provide protection from the 1-percent annual chance flood are shown on this panel. However, all structures taken into consideration for the purpose of coastal flood hazard analysis and mapping are present in the OFIRM database as of 05/01/2010.

LEGEND

- SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO FLOODING BY THE 1% ANNUAL CHANCE FLOOD**
- The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of occurring in any given year. Flood depths, velocities, and other characteristics of the 1% annual chance flood are shown on this map.
- ZONE A** No Base Flood Elevations determined.
 - ZONE AE** Base Flood Elevations determined.
 - ZONE AH** Flood depths of 1 to 3 feet (average velocity of goring); Base Flood Elevations determined.
 - ZONE AD** Flood depths of 1 to 3 feet (average crest flow on sloping terrain); average depth determined; the area of shallow flooding, velocities also determined.
 - ZONE AR** Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was substantially destroyed. Zone AR includes that former flood control system as being reduced to provide protection from the 1% annual chance or greater flood.
 - ZONE APF** Area to be protected from the 1% annual chance flood by a flood control structure. Inland water construction; no Base Flood Elevations determined.
 - ZONE V** Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
 - ZONE VE** Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.
- FLOODWAY AREAS IN ZONE AE**
- The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.
- OTHER FLOOD AREAS**
- ZONE X** Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile, and are protected by levees from the 1% annual chance flood.
 - OTHER AREAS** Areas determined to be outside the 0.2% annual chance floodplain.
 - ZONE D** Areas in which flood hazards are undetermined, but possible.
- COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS**
- OTHERWISE PROTECTED AREAS (OPAs)**
- CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas:
- 1% Annual Chance Floodplain boundary
 - 0.2% Annual Chance Floodplain boundary
 - Floodway boundary
 - Zone D boundary
 - CBRS and OPA boundary
 - Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities.
 - Limit of Moderate Wave Action
 - Limit of Moderate Wave Action coincident with Zone Break
 - Base Flood Elevation line and value, elevation in feet
 - Base Flood Elevation value where uniform system zone; elevation in feet
- Referenced to the North American Vertical Datum of 1988.
- Other symbols:**
- Circle with 'A' or 'B': Chert action line
 - Circle with 'X': Traversed line
 - Circle with '44 52 58, 69 52 52': Geographic coordinates referenced to the North American Datum of 1983 (NAD 83) Western Hemisphere
 - Circle with '100-meter Universal Transverse Mercator grid values, zone 18'
 - Circle with '185510 X': Bench mark (see explanation in notes to Users section of this FISRM)
 - Circle with 'M10': Flood risk
- MAP REPOSITORIES**
- Refer to Map Repositories list on Map Index.
- EFFECTIVE DATE OF COMMUNITY FLOOD INSURANCE RATE MAP**
 (MAY 8, 2015)
- EFFECTIVE DATES OF REVISIONS TO THIS PANEL**
- For community map revision history prior to geographic mapping, refer to the Community Map history table located in the Flood Insurance Study report for this jurisdiction.
- To determine if flood insurance is available in this community, contact your insurance agent or call the National Flood Insurance Program at 1-800-438-6623.

Appendix 6 - USACE Wetland Determination Data Forms

WETLAND DETERMINATION DATA FORM – Northcentral and Northeast Region

Project/Site: Sears Island City/County: Seasport, Waldo County Sampling Date: 8/17/2023
 Applicant/Owner: Maine Department of Transportation State: ME Sampling Point: W1-313 Up
 Investigator(s): Jim Bolduc Section, Township, Range: N/A
 Landform (hillside, terrace, etc.): Slope Local relief (concave, convex, none): convex Slope (%): 17
 Subregion (LRR or MLRA): LRR R, MLRA 144B Lat: 44.44275958 Long: -68.88343617 Datum: WGS84
 Soil Map Unit Name: PbB - Peru fine sandy loam, 0 to 8 percent slopes, very stony NWI classification: Upland
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> If yes, optional Wetland Site ID: _____
Remarks: (Explain alternative procedures here or in a separate report.) Based on the Antecedent Precipitation Tool, the site was experiencing wetter than normal conditions.

Sampling Point: W-100

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)								
Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-2	10YR 2/2	100					Muck	Muck
2-7	10YR 2/2	100					Loamy/Clayey	Clay loam
7-13	2.5YR 5/1	100					Loamy/Clayey	Clay
13-18+	10YR 6/1	70	10YR 5/6	30	C	M	Loamy/Clayey	Clay

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Dark Surface (S7)

- Polyvalue Below Surface (S8) (LRR R, MLRA 149B)
- Thin Dark Surface (S9) (LRR R, MLRA 149B)
- High Chroma Sands (S11) (LRR K, L)
- Loamy Mucky Mineral (F1) (LRR K, L)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- Marl (F10) (LRR K, L)

Indicators for Problematic Hydric Soils³:

- 2 cm Muck (A10) (LRR K, L, MLRA 149B)
- Coast Prairie Redox (A16) (LRR K, L, R)
- 5 cm Mucky Peat or Peat (S3) (LRR K, L, R)
- Polyvalue Below Surface (S8) (LRR K, L)
- Thin Dark Surface (S9) (LRR K, L)
- Iron-Manganese Masses (F12) (LRR K, L, R)
- Piedmont Floodplain Soils (F19) (MLRA 149B)
- Mesic Spodic (TA6) (MLRA 144A, 145, 149B)
- Red Parent Material (F21)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____
 Depth (inches): _____

Hydric Soil Present? Yes No

Remarks:

This data form is revised from Northcentral and Northeast Regional Supplement Version 2.0 to reflect the NRCS Field Indicators of Hydric Soils version 7.0 March 2013 Errata. (http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/nrcs142p2_051293.docx)

WETLAND DETERMINATION DATA FORM – Northcentral and Northeast Region

Project/Site: Sears Island City/County: Seasport, Waldo County Sampling Date: 8/17/2023
 Applicant/Owner: Maine Department of Transportation State: ME Sampling Point: W-200
 Investigator(s): Sean Hale Section, Township, Range: N/A
 Landform (hillside, terrace, etc.): Relatively flat Local relief (concave, convex, none): concave Slope (%): 0%
 Subregion (LRR or MLRA): LRR R, MLRA 144B Lat: 44.44546 Long: -68.88954 Datum: WGS84
 Soil Map Unit Name: PbB - Peru fine sandy loam, 0 to 8 percent slopes, very stony NWI classification: PFO
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> If yes, optional Wetland Site ID: _____
Remarks: (Explain alternative procedures here or in a separate report.) Based on the Antecedent Precipitation Tool, the site was experiencing wetter than normal conditions.	

HYDROLOGY

SOIL

Sampling Point: U-400

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)								
Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-2	10YR 2/2	100					Sandy	Sandy loam
2-6	10YR 3/6	100					Sandy	Sandy loam
6-10	10YR 4/3	100					Sandy	Sandy loam
10-14	10YR 3/6	100					Sandy	Sandy loam

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Dark Surface (S7)

- Polyvalue Below Surface (S8) (LRR R, MLRA 149B)
- Thin Dark Surface (S9) (LRR R, MLRA 149B)
- High Chroma Sands (S11) (LRR K, L)
- Loamy Mucky Mineral (F1) (LRR K, L)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- Marl (F10) (LRR K, L)

Indicators for Problematic Hydric Soils³:

- 2 cm Muck (A10) (LRR K, L, MLRA 149B)
- Coast Prairie Redox (A16) (LRR K, L, R)
- 5 cm Mucky Peat or Peat (S3) (LRR K, L, R)
- Polyvalue Below Surface (S8) (LRR K, L)
- Thin Dark Surface (S9) (LRR K, L)
- Iron-Manganese Masses (F12) (LRR K, L, R)
- Piedmont Floodplain Soils (F19) (MLRA 149B)
- Mesic Spodic (TA6) (MLRA 144A, 145, 149B)
- Red Parent Material (F21)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes _____ No X

Remarks:

This data form is revised from Northcentral and Northeast Regional Supplement Version 2.0 to reflect the NRCS Field Indicators of Hydric Soils version 7.0 March 2013 Errata. (http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/nrcs142p2_051293.docx)
