All information is obtained from peer reviewed scientific literature and compiled to provide guidance on average detection times of drugs in average individuals. All material provided is from infrequent drug usage, chronic drug usage may result in the continual presence of a drug in an individual's blood, oral fluid, or urine.

SAMPLE COMPARISON

- Blood and Oral fluid have comparable detection windows.
- Blood or oral fluid are more appropriate samples to indicate recent, relevant drug use in comparison to urine.

ORAL FLUID TO BLOOD RATIOS- LIMITATIONS

Table 2. Average oral fluid to blood concentration ratios for selected drugs.

Drug (type)	Average oral fluid to blood concentration ratio
Alcohol (ethanol)	1.07
Barbiturates	0.3
Buprenorphine	1
Codeine (basic)	4

- Not all compounds transfer readily from blood to oral fluid.
 - Benzodiazepines and Morphine
 - Example: Blood concentration of Diazepam 10 ng/mL would result in an average oral fluid concentration of 0.1-0.2 ng/mL.
 - The recommended lower reporting limit for diazepam in oral fluid is 1 ng/mL.
