

PREHOSPITAL TREATMENT PROTOCOLS

Effective January 8, 2018

Maine Emergency Medical Services 152 State House Station Augusta, Maine 04333 TEL (207) 626-3860 TTY (207) 287-3659 FAX (207) 287-6251

AUTHORIZATION FOR PROTOCOLS

These protocols are issued by the Medical Direction and Practices Board and govern the practice of EMS licensees by the authority of 32 MRSA § 86.2-A. All Maine emergency physicians and the regional EMS programs were invited to participate in the review and adoption of these protocols through their MEMS Regional Councils.

The Regional Medical Directors agree that when treatments are adopted in their regions, they will be consistent with these protocols.

The protocols will be continually reviewed. New or revised protocols will be listed on the Protocol Errata form located on the Maine EMS website.

Michael Bohanske, M.D.	Region 1 Medical Director	
Seth Ritter, M.D.	Region 2 Medical Director	
Timothy Pieh, M.D.	Region 3 Medical Director	
Jonnathan Busko, M.D.	Region 4 Medical Director	
Beth Collamore, M.D.	Region 5 Medical Director	
Tracy Jalbuena, M.D.	Region 6 Medical Director	
Matthew Sholl, M.D.	Maine EMS Medical Director	
Kate Zimmerman, D.O.	Assistant Maine EMS Medical Director	
Kevin Kendall, M.D.	American College of Emergency Physicians	
Bethany Nash, PharmD	Clinical Pharmacist /Pharmacology Representative	
David Saquet, D.O.	At Large	
Shaun A. St. Germain	Maine EMS Director

<u>*O</u>	

ACLS means Advanced Cardiac Life Support.

Advanced Airway means the skills of endotracheal intubation and use of other airway modalities such as Blind Insertion Airway Devices (BIAD) performed only by those who have completed practical training in each of these skills.

AEMT (Advanced EMT) means the ability to provide Advanced EMT level of care (previously called Intermediate EMT).

AHA means the American Heart Association

ALS (Advanced Life Support) means the ability to provide advanced level of medical care, which in the prehospital realm means *Paramedic*. The ALS skills may include the following: IV access, advanced airway, cardiac monitoring, and/or oral or parenteral medications.

ALS (Advanced Life Support) If Available means that the patient shall receive the highest appropriate ALS intervention as soon as possible. The decision in this realm as to which interventions may be appropriate rests with the Paramedic, if available. If any skills other than basic life support are deemed necessary or initially implemented, an ALS response should be sought, with simultaneous dispatch if possible. The use of a medical priority dispatching program, approved by the State Medical Director, is encouraged. When this cannot happen, the crew in attendance should bring ALS care and the patient together in the fastest of three ways: (1) ALS back-up at the scene; (2) ALS back-up met en route; or (3) ALS by hospital staff in the emergency department if prehospital rendezvous is not possible.

The BLS providers on the scene may modify the ALS response as appropriate.

BP in these protocols refers to the systolic blood pressure.

Continuous Nebulization is administration of 3 unit doses of albuterol or albuterol-ipratropium without interruption; that is, put all 3 unit doses into the nebulizer at the same time (if volume allows) and administer until complete OR administer 1 unit dose x 3 without waiting between administrations.

Emergency Department means a hospital that provides an organized Emergency Service or Department that is available twenty-four (24) hours a day, seven (7) days a week and has the capability to provide On-Line Medical Control, to evaluate, treat, stabilize, and to refer to an appropriate outside resource all persons who present themselves for treatment.

Page 6 Purple 1

Emergency Medical Responder

The MDPB recognizes the Emergency Medical Responder (EMR) scope of practice to include the following:

- a. Airway management, including manual maneuvers, suctioning, application of supplemental O_2 , and use of the following airway adjuncts pocket mask, OPA/NPA, BVM
- b. Acquisition of manual vital signs
- c. Application of medications for force protection only (such as the Mark 1 kit)
- d. Performance of manual CPR and use of AED
- e. Assistance in normal childbirth
- f. Manual stabilization of the cervical spine or extremity injuries
- g. Hemorrhage control, including use of a tourniquet
- h. Emergency moves
- i. Eye irrigation

The Maine EMS EMR may practice within this scope of practice to include these skills

EMS Provider means any person or service licensed by Maine EMS to provide emergency medical services.

End-tidal CO₂ (ETCO₂) is a measurement of carbon dioxide in exhaled air used to assess ventilation, also referred to as capnography. The capnography monitoring must be *continuous* and with a device that displays a waveform

Fluid Bolus indicates maximum fluid administration achievable without pumps or other special equipment in the field setting. Specifically, running a large bore IV wide open until the desired clinical condition or blood pressure, based on the patient's underlying condition, is achieved. A true IO bolus, at the appropriate dose with a syringe/3-way stop-cock assembly or pressure bag, is acceptable. Pediatric boluses are 20 mL/kg, and may be repeated one time if patient remains hypotensive, unless a specific alteration is noted in the protocols. Unless a specific volume of fluid is specified in the specific protocol, if the patient requires more than 40 mL/kg of IV fluid, contact OLMC to further guide fluid administration.

Hypoglycemia is a blood glucose less than 60 mg/dL.

IO in these protocols, means intraosseous access. IO may be used by the Advanced EMT or Paramedic. The IO route should be considered in any patient if an IV is not established within two attempts or 90 seconds and that patient has one of the following:

- a. Altered mental status (GCS less than or equal to 8)
- b. Respiratory failure (SpO_2 less than or equal to 90% after appropriate oxygen therapy, respiratory rate less than 10 or greater than 40 breaths per minute) with alteration of mental status
- c. Profound hypovolemia or hemodynamic instability with alteration of mental status or other evidence of shock recall, the use of an IO for volume resuscitation requires the use of a pressure bag/3-way stop-cock to achieve optimal flow rates
- d. Cardiac arrest (medical or traumatic)

(Continued on next page)

Page 7 Purple 2

(continued)

Additionally, the provider may choose to utilize the IO route first in critical patients for whom IV access may be difficult.

With discussion with OLMC, may consider IO placement for the following conditions:

- a. Profound hypovolemia (Systolic BP less than 90 mmHg) without alterations in mental status or other evidence of shock
- b. Burn patients with bilateral upper extremity burns

*IO is CONTRAINDICATED in the following conditions

- a. Fracture of the tibia or femur in lower extremity placement or fracture of the humerus in upper extremity placement
- b. Infection at insertion site
- c. IO within the prior 24 hours in the same bone
- d. Knee replacement (identified by midline vertical scar over the patella)
- e. Tumor near site
- f. Inability to locate landmarks
- g. Excessive tissue at insertion site
- h. IO access is not intended for prophylactic use

Approved Sites (one per bone): Per manufacturer recommendations

Paramedic: If infusion of medications or fluids causes significant pain, consider the following:

- 1. Adult: Consider lidocaine 2% (preservative free) 40 mg slow push followed by 10 mL Normal Saline flush. If pain continues, contact OLMC for OPTION of additional 20 mg bolus
- 2. Pediatric: Consider lidocaine 2% (preservative free) 0.5 mg/kg (MAX 40 mg) slow push followed by 10 mL Normal Saline flush. If pain continues, contact OLMC for OPTION of additional 0.25 mg/kg (MAX 20 mg) slow push

IV means any balanced electrolyte solutions may be used, such as Lactated Ringers, Normal Saline and 5% Dextrose in Water. IV solutions, as defined in this document, DO NOT include other additives (such as potassium) or medications. Normal Saline is the fluid of choice for patients with history of renal failure, not Lactated Ringers. Recommended catheter size for rapid fluid resuscitation in adults is 14-18 gauge. If rapid fluid resuscitation is not required, smaller catheter sizes and heparin/saline locks may be used. Heparin used for this procedure is not considered a medication.

MDPB means Maine EMS Medical Direction and Practices Board, which consists of the six Regional Medical Directors, a physician representing the Maine Chapter of the American College of Emergency Physicians, an At-Large physician representative, a Clinical Pharmacist or Toxicologist, the State Assistant EMS Medical Director and the State EMS Medical Director.

NR means a non-rebreather oxygen mask.

 $\mathbf{O_2}$ means oxygen therapy as appropriate for patient.

Page 8 Purple 3

On-Line Medical Control (OLMC) refers to the on-line physician/physician assistant/nurse practitioner who is licensed by the State of Maine and authorized by a hospital to direct emergency medical services persons consistent with the protocols developed by the MDPB.

Other Appropriate Destination means a facility that has been approved by the Board of EMS to receive, via ambulance, patients who are in need of emergency care.

Paramedic Back-up means use of an advanced life support resource when a presenting patient needs more than basic life support. As noted above, in the prehospital setting this indicates a Paramedic response. An ALS back-up agreement should be written between EMS provider services routinely offering and accepting ALS back-up support. This would establish medical/operational/ liability expectations of both services. These protocols cannot mandate any service to routinely offer or receive back-up. However, any decision in this regard, particularly to refuse to offer or accept ALS back-up, should be grounded in reasonable medical, operational, or financial considerations and should be reviewed by the individual service's legal counsel.

Pediatric Patient in these protocols, means pre-pubertal (without pubic, axillary, or facial hair).

PPV means Positive Pressure Ventilation such as (in order of preference): two- person bag-valve-mask technique with oxygen, one-person bag-valve-mask technique with oxygen, mouth-to-mask ventilation with oxygen, and mouth-to-mask ventilation without oxygen.

Page 9 Purple 4

These protocols were developed for the following reasons:

- 1. To provide the EMS provider with a quick field reference, and
- To develop written standards of care which are consistent throughout the State of Maine

Users of these protocols are assumed to have knowledge of more detailed and basic patient management principles found in EMS textbooks and literature appropriate to the EMS provider's level of training and licensure.

EMS providers are encouraged to contact OLMC in any situation in which advice is needed, not only in situations as directed by theses written protocols.

To use these protocols as they were intended, it is necessary to know the philosophy, treatment principles, and definitions which guided the physicians and other EMS providers who drafted these protocols:

- **Delays in treatment should very RARELY delay transport!** This is especially true for trauma patients, patients with chest pain and patients with suspected stroke. IVs should be started en route except in those situations where treatment at the scene is in the patient's best interest, such as shock, prolonged extrication, or a cardiac patient when full ACLS care is available. Delays in transport should be discussed with OLMC.
- Inability to establish voice contact with OLMC: There are rare situations where the patient is unstable and delay in treatment threatens the patient's life or limb. If, after good faith attempts, the EMS provider cannot contact OLMC, then the EMS provider is authorized to use any appropriate treatment protocols as if they were standing orders. In such cases, treatments must still be consistent with the EMS provider's training and licensure. Continue attempts to contact OLMC and document these attempts on the patient run record.
- Transports and transfers: During transports and transfers, ambulance crews will follow these MEMS protocols, including use of only those medications and procedures for which they are trained and authorized by protocol.
- **Hospital destination choice**: If a patient needs care which the ambulance crew, in consultation with OLMC, believes cannot be provided at the most accessible hospital, the patient will be transported to the nearest facility capable of providing that care upon the patient's arrival. If, with OLMC consultation, a patient is believed to be too unstable to survive such a diversion, then the patient will be transported to the most accessible hospital with an emergency department. Diversion is also non-binding, and if a patient insists or if the crew deems that bypass is not in the patient's best interest, then going to a hospital "on diversion" is appropriate. If OLMC contact is not possible, the ambulance crew is authorized to make this determination. OLMC cannot legally refuse these patients.

Page 10 Brown 1

- **Regional destination**: Each region has the authority to develop protocols which designate the appropriate destination for patients transported from the scene. Any such protocol should be patient-centric and created exclusively to offer patients emergent care only available at selected regional sites. Examples of such protocols include the Maine EMS Trauma System.
- Treatments/medications should be given in the order specified. However, the MDPB recognizes that often treatments are delivered simultaneously and more than one protocol may be used. OLMC may request treatments/medications out of sequence for medical reasons.
- MEMS patient/run record will be legible and thoroughly completed for each call or for each patient when more than one patient is involved in a call. This document is our legacy of patient care and holds valuable information for hospital providers. This information is essential to patient care and safety. Services must provide a patient care document before leaving the hospital. In MOST circumstances, this document will be a completed copy of the patient run report, although, in rare circumstances, when it is not possible to complete the electronic patient care record before leaving the hospital, services may provide the hospital with a Maine EMS-approved, one page, patient care summary. THIS DOCUMENT DOES NOT REPLACE THE COMPLETED RUN REPORT. These documents may become part of the patient's hospital record and, in an effort to ensure excellent patient care, all information on this written summary must reflect the information in the electronic run report. Services must still complete the electronic patient care report and make the report available to the hospital as soon as possible.
- Quality Assurance: All EMS providers and services must be in compliance with the Regional and State Quality Improvement Program to the satisfaction of the Regional Medical Director.
- Assuming and Reassessing care already provided: EMS providers who will be
 assuming the responsibility for patient care will also be responsible for assessing the
 care provided before their arrival, and for all subsequent care after they arrive up to
 and including their level of training and licensure. If an EMS provider has not been
 trained in a particular treatment listed at his level, or if that treatment is not within the
 EMS provider's scope of practice, the provider may not perform the treatment.
- If there is a Paramedic on scene that is willing to:
 - a. Accompany the AEMT on the call, and
 - b. Accept responsibility for the AEMT's actions

Then the Paramedic may direct the AEMT to administer medications that are within the AEMT's scope of practice. This may be accomplished without contacting OLMC as long as the medication administration would not require OLMC for the Paramedic. If the Paramedic is unwilling to accept the above responsibilities, then the AEMT must contact OLMC before administering any medications.

Page 11 Brown 2

- **Defibrillations**: Advanced EMTs are expected to follow these protocols within the limitations of the monitor/defibrillator available to them.
- Carbon monoxide monitors: Carbon monoxide monitors may be used for informational purposes only. Any alterations of treatment based on pulse carboximetry readings must be approved by OLMC.
- Medical Control permission: If a treatment is listed as requiring Medical Control
 permission at one level and is listed again without requiring OLMC permission at a
 higher level, the higher-level EMT need not seek OLMC permission.
- **Deviation from protocols:** These protocols represent a consensus of the MDPB. In unusual situations, OLMC may deviate from these protocols if done in the patient's best interest. The deviation in care ordered must be within the scope of practice, training and skill of the EMS provider. The reasons for deviating from these protocols must be documented in the patient's chart. Under such circumstances, if the ALS provider agrees, the ALS provider will verify and will comply with OLMC orders, will fully document the deviation on the patient run record, and will not consider the care rendered to be an emergency medical treatment to be routinely repeated.
- Arrival of officially dispatched EMS personnel: Once EMS personnel have arrived on the scene, they may interact with other medical personnel on the scene who are not a part of the organized EMS system responses in the following manner:
 - Maine EMS licensees not affiliated with one of the responding services may only provide care within their scope of practice with the approval of the ambulance crew-member in charge of the call.
 - The patient's own physician, physician assistant, or nurse practitioner may direct care as long as they remain with the patient (in their absence, direction of care is subject only to these protocols and OLMC). You may assist this person within the scope of your practice and these protocols. Only a physician, physician assistant authorized to offer OLMC by their hospital, or independent nurse practitioner may give orders outside of the MEMS protocols. Questions in this regard should be resolved by OLMC. You may show this person **Black 1**, the "Non-EMS System Medical Interveners" protocol to assist with your explanation.
 - Other unsolicited medical interveners must be Maine licensed physicians, nurses, nurse practitioners or physician assistants whose assistance you request. The **Black 1** "Non-EMS System Medical Interveners" protocol describes this, and should be shown to such interveners.
 - Other healthcare providers in the home: Other healthcare providers in the home attending the patient (i.e. R.N., L.P.N., C.N.A., Nurse Midwife, etc.) are a valuable source of information and assistance. Any aid or treatment they wish to give must be authorized by OLMC. Any dispute over treatment or transport should be settled by OLMC.

Page 12 Brown 3

- Home healthcare devices and appliances: Many patients will have devices and appliances (drains, ports, LVAD, insulin pumps, etc.) with which they are routinely discharged home. Patients (or their licensed care providers or previously instructed family members), are expected to maintain them on their own. These devices have some risks associated with them, but are generally considered safe in the home environment. As such, EMS providers are not restricted in the care or transfer of these patients based solely on the presence of these devices or appliances. If an issue arises and unfamiliarity with, or any questions concerning these devices that cannot be immediately resolved by the patient or caregivers, it should be referred to OLMC.
- Left Ventricular Assist Device (LVAD): A surgically implanted pump to assist left ventricular function. An LVAD can be a bridge to a heart transplant (although used for chronic care as well). Inform OLMC as soon as possible when interacting with a patient with an LVAD, as diversion to a hospital with a higher level of care may be suggested. Direct contact with the cardiac service responsible for this patient is also suggested at the earliest possible moment. The patient or patient's family should have this contact information readily available. No cardiac arrhythmia should be treated if the LVAD is functioning, as judged by an audible sound or pulse, without medical control approval for any treatment. Be sure to bring the patient's batteries (including the 24-hour battery), the large battery charger and all other accessories. Local EMS services may receive specialized training and protocol exemptions to extend help to these patients by working with regional EMS Medical Directors and MEMS.
- **Graduates with a current certification from a Maine EMS-approved wilderness EMT course** may apply the principles of care taught in that course with the approval of the service Medical Director and when patient arrival at a definitive care setting will be more than 2 hours.
- **Repeated Treatment:** Unless otherwise indicated, any treatment included in these protocols may be repeated after reassessment and with OLMC permission.
- External Pacing (where indicated in these protocols) should be performed if a pacer is available.
- Oxygen supplementation will be by nasal cannula or non-rebreather mask as appropriate.
- Patient Sign-Offs: There exist three origins for patient sign-offs:
 - a. A patient refuses transport and the provider agrees transport is not warranted
 - b. The patient refuses transport but the provider does not feel this is safe
 - c. The patient requests transport but the provider refuses (this final example is called an EMS System-initiated sign-off)

Page 13 Brown 4

Patient-initiated sign-offs should only be considered in patients with decision-making capacity and resources available to care for themselves and when non-transport is considered safe. These sign-offs do not require discussion with On-Line Medical Control. In situations which the patient requests sign-off but the EMS provider deems inappropriate, please refer to OLMC. EMS System-initiated patient sign-offs (i.e.: when the patient requests transfer but the EMS provider refuses) are tremendously risky interactions and are not permissible. These sign-offs must be approved by OLMC and the service is expected to review all of these events through the service's quality assurance mechanism. Patient medical records must be completed for all of these interactions.

- Maine EMS Special Circumstance Protocols: Maine EMS protocols are intended to address the vast majority of medical emergencies encountered by an EMS provider. While intended to be comprehensive, certain patients exist with rare medical conditions that require highly specialized emergent care. In such situations, Maine EMS has created the "Special Circumstance Protocols". These are prearranged medical protocols specialized to individual patients, suggested by the patient's medical provider and ratified by the EMS service Medical Director. Patients will present with a "Maine EMS Special Circumstance Protocol Form" that outlines the patient's individual protocol and is signed by the patient's physician, the EMS service Medical Director and the State of Maine EMS Medical Director. These special circumstance protocols should be made known to local EMS services and providers. In cases of question or uncertainty regarding the nature of the protocol, please refer to OLMC.
- **During transport**, patients should be secured to the stretcher utilizing both lateral and shoulder straps.
- **Paramedics and AEMTs** are expected to perform all duties in their listed scope of practice as well as those of the prior scopes of practice in the appropriate logical order.
- Vagus Nerve Stimulators (VNS) are implanted devices that are used to treat refractory partial seizures by stimulating the vagus nerve. They are not currently approved to treat generalized seizures. The exact mechanism is unclear but the devices provide continuous on-off cycles of vagal stimulation to prevent seizure. Patients with a VNS typically have a magnet that they can use to trigger an additional 30 second stimulation period when they feel a seizure coming on or when they are having a seizure. Caregivers are typically trained to assist with the magnet. In the event no one is available who is trained to use the magnet, the EMS provider at any level may assist the patient if the patient can confirm that the device is a VNS and after the EMS provider consults with medical control.
- In the critically ill patient, vascular access may be difficult to obtain. The decision on which technique to use first, IV versus IO, is based on the assessment and judgment of the provider. Ultimately, an IV is the superior form of vascular access but the IO is appropriate for the initial resuscitation of the critically ill patient if, in the provider's judgment, attempts to obtain IV access would lead to an unreasonable delay in initiating fluid resuscitation.

Page 14 Brown 5

- **Option to Cancel ALS policy**: If the patient meets the protocol specific cancellation criteria, the EMT and AEMT, in consultation with OLMC, may determine that it is appropriate to cancel the ALS response based on transport time, patient co-morbidities, and any other applicable factors.
- All equipment referenced in these protocols must be "Maine EMS-Approved." In addition, it is expected that all providers will be appropriately trained before using any piece of equipment, device, or technique.

TASER PROBES

The use of a TASER does not automatically necessitate an EMS response or involvement. In assessing such patients, be cognizant of the potential for underlying metabolic dysfunction. TASER probes may be removed from the subject by the deploying officer. Probes that are embedded in a sensitive area (i.e. face, neck, breast, and genital area) may need to be removed by medical personnel. In these cases, the subject should be transported to the hospital for examination and removal of the probes by medical personnel at the hospital. Other adverse affects, if any, (i.e. respiratory difficulty, seizures, etc.) should be treated as appropriate by the applicable protocol(s).

Page 15 Brown 6

Maine EMS Statement on "Rescue" or "Alternate" Airway Devices

Maine EMS recognizes 2 major classes of Blind Insertion Airway Devices (BIADs). The first class, periglottic devices, includes the LMA® and Cobra PLA®. The second class, transglottic or potentially transglottic devices, includes the Combitube® and King LT®. Any FDA-approved devices from these classes are approved for use.

A c-spine collar should be considered to help protect placement of all endotracheal intubations, periglottic and transglottic airway devices.

There are periglottic devices on the market that can be used to facilitate endotracheal intubation (i.e. ILMA®, LMA®). If these devices are placed without an attempt at endotracheal intubation, they may be treated as any other periglottic device. If they are used to assist in placing an endotracheal tube, that tube must be treated and confirmed as any other endotracheal intubation.

It is recommended to have *NO MORE THAN* one device per class (periglottic and transglottic). If a service elects to have multiple options per class, then training and maintenance in proficiency for all devices available are required.

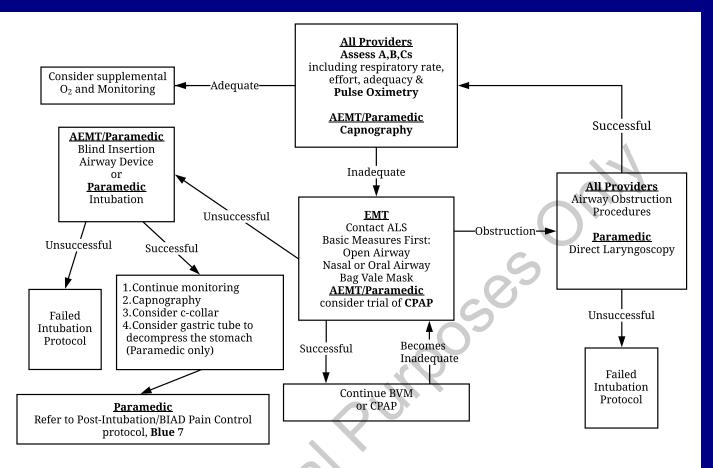

Page 16 Blue 1

Airway Management Checklist

1.	Airway adjuncts ready Suction Oropharyngeal airway/ 2 nasopharyngeal airways Nasal cannula for apneic oxygenation
2.	Intubation equipment ready Laryngoscope assembled and functional ET tube ready with lubricant, bougie and syringe Tube-securing device ready Continuous end-tidal CO ₂ monitor ready
3.	Back-up equipment ready Blind Insertion Airway Device (LMA, iLMA, or King) available Quick-trach or other surgical airway available
4.	Team ready Airway manager Ventilator Assistant
5.	Plan discussed
6.	Patient ready Non-rebreather, BVM, or CPAP pre-oxygenation/de-nitrogenation At least one IV/IO in place Head elevated laryngoscope position (30 degree head-of-bed elevation) unless contraindicated BP cuff / pulse oximetry / cardiac monitor attached Evaluate airway difficulty: 3-3-2 rule, dentures, recessed mandible, facial hair or trauma, c-collar in place Prep for surgical airway as needed
7.	Medications ready Post-intubation: pain control: fentanyl sedation: midazolam OR ketamine
8.	Automatic ventilator settings (if available) Volume: 8 mL/kg Rate: 16 (10 in asthma/COPD)

Page 17 Blue 2

Adult Airway Algorithm

- This protocol is for use in patients whose age is greater than 12 years old or patients longer than the Broselow Tape® (or equivalent).
- An intubation attempt is defined as passing a bougie or the endotracheal tube past the teeth or inserted into the nasal passage.
- Continuous capnography is mandatory with all patients with BIAD or Endotracheal Tube; if prolonged use of BVM, consider use of capnography.
- The goal of airway management is adequate oxygenation, ventilation, and airway protection. If an effective airway is being maintained by BVM with OPA and/or NPA(s), it is acceptable to continue with basic airway measures rather than BIAD or Intubation.
- Consider addition of high-flow nasal cannula in addition to BVM/face-mask prior to intubation attempt if not meeting oxygenation goals. Keep in place during intubation attempt.

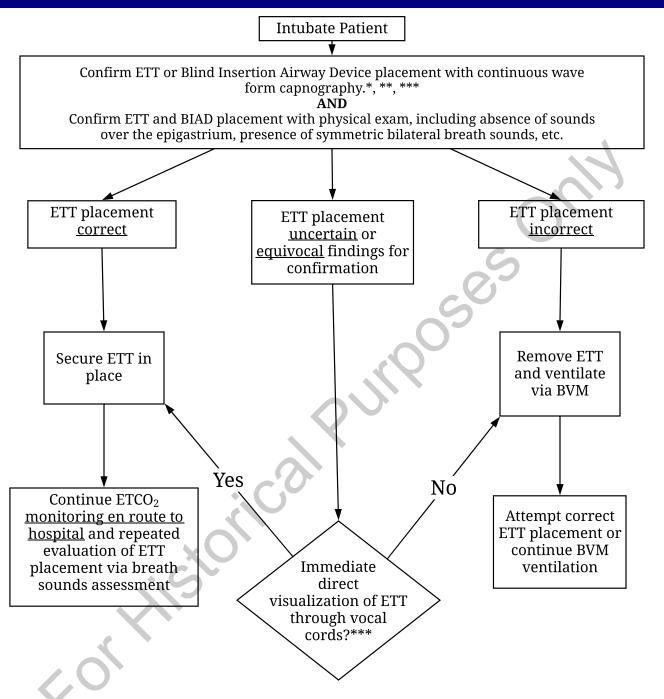

Patients are more effectively ventilated with face-mask ventilation when:

- 1) A two-person ventilation technique is used
- 2) ETCO₂ is used to guide ventilation
- 3) Avoiding hypo- and hyperoxia
- 4) Avoiding hypo- and hyperventilation
- 5) Minimizing peak airway pressure
- 6) When tolerated, both oral and nasal airways
- **Face mask ventilation can be achieved with a transport vent if so trained**

PEARLS for Endotracheal Intubation

- * Position the airway for best view of the cords – raise head to the sniffing position (i.e. earlobe in-line with sternal notch)
- * Preparation: (four cornerstones)
- 1) ET tube
- 2) Laryngoscope with backup blade
- 3) Suction
- 4) Bougie on every attempt
 - * Always have a back-up plan should the primary strategy fail*
 - *When advanced airways are placed, secure the tube with either a commercial tube holder or tape, rather than held manually*

Confirmation and Monitoring of Advanced Airways in **Adults**

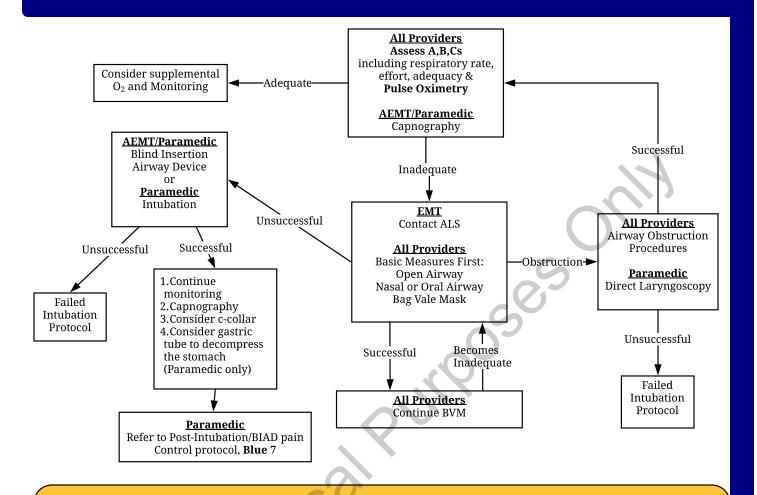

^{*} For cardiac arrest patients, consider placement of the ETT as well as lack of pulmonary circulation in the interpretation of ETCO₂ findings.

Page 19 Blue 4

^{**} Depending on the device used, ETCO₂ devices may not be applicable to the pediatric patient.

^{***} Nasotracheally-intubated patients should be assumed to have incorrect ETT placement if findings of breath sounds or ETCO₂ results are uncertain or equivocal

Pediatric Airway Algorithm

- An intubation attempt is defined as passing a bougie or the endotracheal tube past the teeth or inserted into the nasal passage.
- Continuous capnography is **mandatory** with all patients with BIAD or Endotracheal Tube; if prolonged use of BVM, consider use of capnography.
- The goal of airway management is adequate oxygenation, ventilation, and airway protection. If an effective airway is being maintained by BVM with OPA or NPA(s), it is acceptable to continue with basic airway measures rather than BIAD or Intubation.
- Consider addition of high-flow nasal cannula in addition to BVM/face-mask prior to intubation attempt if not meeting oxygenation goals. Keep in place during intubation attempt.

Patients are more effectively ventilated with face-mask ventilation when:

- 1) A two-person ventilation technique is used
- 2) ETCO₂ is used to guide ventilation
- 3) Avoiding hypo- and hyperoxia
- 4) Avoiding hypo- and hyperventilation
- 5) Minimizing peak airway pressure
- 6) When tolerated, both oral and nasal airways are placed

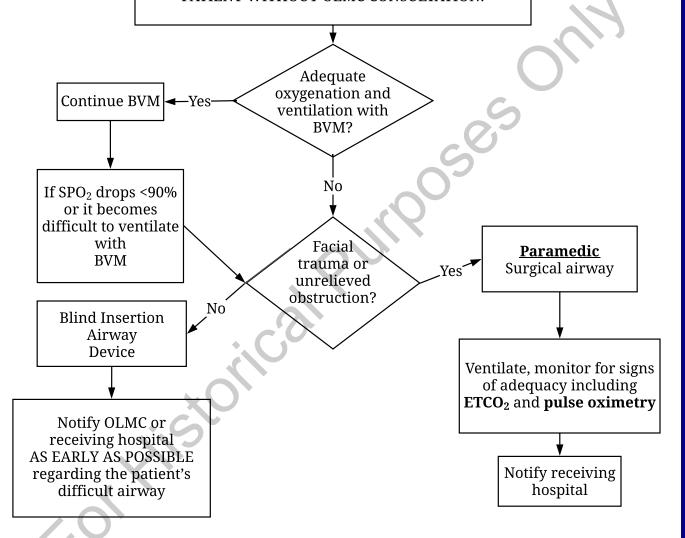

PEARLS for Endotracheal Intubation

- * Position the airway for best view of the cords raise head to the sniffing position (i.e. earlobe in-line with sternal notch)
- * Preparation: (four cornerstones)
- 1) ET tube
- 2) Laryngoscope with backup blade
- 3) Suction
- 4) Bougie on every attempt
 - * Always have a back-up plan should the primary strategy fail*
- *When advanced airways are placed, the tube be secured with either a commercial tube holder or tape, rather than held manually*

Failed Intubation Algorithm

A "failed" intubation or the "can't intubate patient" is defined as two (2) unsuccessful intubation attempts by the most proficient technician on scene OR anatomy inconsistent with intubation attempts.

NO MORE THAN THREE (3) TOTAL ATTEMPTS PER PATIENT WITHOUT OLMC CONSULTATION.

Continuous pulse oximetry and ETCO₂ monitoring should be utilized in all patients with difficult airways or respiratory distress.

FOR PEDIATRIC PATIENTS REQUIRING SURGICAL AIRWAY – Consider needle cricothyrotomy in patients < 10 years old OR if physiologically young enough that surgical landmarks are NOT identifiable.

Page 21 ______ <u>Blue 6</u>

Post-Intubation/BIAD Pain Control

All patients with an ETT or BIAD inserted who are **not** currently in cardiac arrest are at risk for pain, anxiety and self-extubation. Therefore, appropriate pain control and anxiolysis are required for all intubated patients. Signs of inadequate pain control/sedation include eye opening, coughing or gagging, sweating, tearing, new or worsening hypertension and/or tachycardia, tachypnea, or attempts to self-extubate.

EMT

E

Α

1. Minimize stimulation

ADVANCED EMT

2. Place IV for anticipated medication administration

PARAMEDIC

- 3. Pain control
 - a. Fentanyl 0.5 1 mcg/kg IV/IO every 15 minutes to a maximum cumulative dose of 5 mcg/kg
- 4. Anxiolysis Contact **OLMC** for **ONE** of the following options:
 - a. Midazolam
 - i. 0.5 2.5 mg **IV/IO** every 5 minutes, may repeat x 3 to a max cumulative dose of 5 mg
 - ii. 1-5 mg **IM** every 5 minutes, may repeat x 3 to a max cumulative dose of 10 mg

-OR-

- b. Ketamine
 - i. 0.2 mg/kg **IV/IO**, max single dose of 25 mg, may repeat x 1 in 5 minutes
 - ii. 0.4 mg/kg IM, max single dose 50 mg, may repeat x 1 in 10 minutes

It is important to **avoid** hypotension in the critically ill patient, especially post cardiac arrest and head injury. Therefore, it is recommended to treat pain first and anxiolysis (if needed) second. Anxiolysis should be treated with **either** midazolam **OR** ketamine, not a combination of the two as this could cause profound hypotension.

P

Page 22 Blue 7

Respiratory Distress with Bronchospasm #1 (COPD, Emphysema, Chronic Bronchitis, Asthma)

CAUTION: RESPIRATORY DISTRESS MAY BE DUE TO MULTIPLE OTHER CAUSES FOR WHICH OTHER TREATMENTS MAY BE INDICATED, INCLUDING THE FOLLOWING:

Pulmonary Edema, see **Blue 11** Anaphylaxis, see **Gold 1** Chest Trauma, see **Green 10**

E

EMT

- 1. O_2 as appropriate
- $2.\ ext{If needed,}$ assist ventilations with positive pressure ventilation using 100% $ext{O}_2$
- 3. Request ALS
- 4. For EMT level providers assist with self- administered bronchodilator inhaler. Tell OLMC the name of the inhaler. OLMC will prescribe number of puffs

ADVANCED EMT

- 5. Cardiac monitor
- 6. Manage airway as needed, refer to Blue 3 or Blue 5
- 7. Contact OLMC to administer albuterol, 2.5 mg by nebulization (use 3 mL premix or 0.5 mL of 0.5% solution mixed in 2.5 mL of normal saline)
- A
- 8. Consider CPAP in patients > 18 y/o Recall that CPAP should *never* take the place of bronchodilators and should be used only **after** or in concert with inhaled bronchodilators in patients with acute bronchospasm. Specifically, if CPAP is going to be used in the asthmatic, continuous nebs *must* be administered *simultaneously* and the provider must be prepared to intubate this patient. If ALS not available or delayed, contact OLMC for the additional options in the patient not responding to above therapy
 - a. Continuously nebulized albuterol
 - b. EPINEPHrine 0.3 mg IM of 1mg/mL (1:1000) solution (adults only)

PARAMEDIC

- 9. Adult/Pediatric
 - a. Albuterol 2.5 mg by nebulization. May repeat 1 time; or
 - b. Ipratropium bromide 0.5 mg / albuterol sulfate 2.5 mg nebulizer if greater than one (1) year of age and more significant respiratory distress, and may repeat one time

(continued)

P

Respiratory Distress with Bronchospasm #2 (COPD, Emphysema, Chronic Bronchitis, Asthma)

11. Dexamethasone

Adult: 10 mg IV/IM/IO x 1

Pediatric: 0.6 mg/kg (single max dose of 10 mg) IV/IM/IO x 1

12. Contact OLMC for the following OPTIONS:

a. Repeated or continuous albuterol by nebulization or inhaler.

b. For asthma only - **ADULT** – EPINEPHrine 0.3 mg **IM** of 1mg/1mL (1:1000) solution every 20 minutes

c. For patients in status asthmaticus or not responding to repeated nebulizers or the above therapy, consider Magnesium Sulfate 2 grams **IV/IO** over 10 minutes, consider placing this medication on a pump.

Asthmatic patients:

Airway management of asthmatic patients is primarily pharmacological, not mechanical. Therefore, the focus should be on taking those actions that enable the provider to provide inhaled bronchodilators and, in patients with severe bronchospasm, obtain rapid IV or IO access, administer IV dexamethasone, IV magnesium, and consider IM EPINEPHrine. Due to the pathophysiology of asthma, positive pressure ventilation (facemask, BIAD, or endotracheal intubation) rarely, if ever, is an effective treatment without pharmacological intervention. Therefore, unless the patient is apneic, provider supplemental oxygen via non-rebreather and focus on providing pharmacological interventions. CPAP is a last resort and a bridge to intubation.

P

Page 24 Blue 9

Anxiolysis in CPAP

Patients with respiratory failure who are unable to oxygenate and ventilate often require CPAP. These patients may be combative and unable to tolerate CPAP either due to their hypoxia or anxiety.

EMT/Advanced EMT/Paramedic

1. Attempt coaching

PARAMEDIC

- 2. Consider ondansetron 4 mg IV/IM if CPAP causing nausea and bloating
- 3. If unable to achieve sufficient anxiolysis to tolerate CPAP with coaching, contact **OLMC** for for **ONE** of the following anxiolytics:
 - a. Midazolam
 - i. 0.5 2.5 mg **IV** every 5 minutes, may repeat x 3 to a max cumulative dose of 5 mg
 - ii. 1-5 mg **IM** every 5 minutes, may repeat x 3 to a max cumulative dose of 10 mg

-OR-

- b. Ketamine
 - i. 0.2 mg/kg IV, max single dose of 25 mg, may repeat x 1 in 5 minutes
 - ii. 0.4 mg/kg IM, max single dose 50 mg, may repeat x 1 in 10 minutes

P

Pulmonary Edema (without shock)

Avoid nitroglycerin in any patient who has used a phosphodiesterase inhibitor within the past 48 hours. Examples are: sildenafil (Viagra, Revatio), vardenafil (Levitra, Staxyn), tadalafil (Cialis, Adcirca) which are used for erectile dysfunction and pulmonary hypertension. Contact OLMC for options in patients who have taken such medicines.

E

If initial systolic BP is less than 100 mmHg, refer to "Cardiogenic Shock" protocol, **Red 1**7

EMT

- 1. O₂ as appropriate. Assist ventilations (PPV) if needed
- 2. Assess for shock
- 3. If BP greater than 100 mmHg, place in sitting position
- 4. Request ALS

ADVANCED EMT

- 5. Cardiac monitor and 12-lead ECG
- 6. IV en route
- 7. Manage airway as needed, refer to Blue 3 or Blue 5

Α

- 8. Contact OLMC for administration of nitroglycerin 0.4 mg tab or 1 spray **SL**. Repeat nitroglycerin at 2-minute intervals if systolic BP greater than 100 mmHg. After initiation of SL nitroglycerin, may place 1 inch of nitroglycerin ointment 2% to the chest wall if BP greater than 100 mmHg and remove nitroglycerin ointment 2% if BP less than 100 mmHg. If the patient has had nitroglycerin before and no IV is established, and systolic BP is greater than 100 mmHg, then it is OK to give nitroglycerin.
- 9. Consider use of CPAP

PARAMEDIC

- 10. Paramedic may perform all treatments above without medical control
- 11. Contact OLMC if above measures are not working

P

Page 26 Blue 11

Pulmonary Hypertension Complications

There are increasing numbers of patients being treated for pulmonary hypertension throughout the state of Maine. Pulmonary hypertension is a disease in which a patient's pulmonary arterial pressures are elevated and can be due to multiple factors, including heart disease, chronic lung disease, or thromboembolic disease. Additionally, in some cases of pulmonary hypertension, the etiology is uncertain. Patients manifest with multiple clinical symptoms, including dyspnea, chest pain and syncope. Pulmonary hypertension is NOT a disease that will be diagnosed in the prehospital setting. Increasingly, patients are being treated for the disease with medications that cause pulmonary vascular vasodilation, such as Remodulin.

EAF

EMT

Transport Destination

Preferably, patients suffering from pulmonary hypertension who are treated by a specialist should be transported to the hospital managing their disease for ALL emergencies whenever feasible or operationally reasonable. If operational circumstances or the patient's needs dictate otherwise, please transport to the closest reasonable facility. Please consult OLMC for any questions.

ADVANCED EMT

Medication Interruption

Remodulin and other medications used to treat pulmonary hypertension are provided by central access, typically through a pump. Patients are often treated with both IV and oral medications. Disruptions of the patient's IV medications can lead to increased symptoms. Most medication interruptions are NOT related to the pump, but rather the patient's central line and loss of access. In the case of interruptions of IV medication due to loss of central access:

1. Establish peripheral access

PARAMEDIC

- 2. Verify the patient's medication and dose
- 3. Re-initiate the patient's medication through the newly-established peripheral access
- 4. Consider the transport destination suggestions as listed above.

PEARLS FOR PULMONARY HYPERTENSION COMPLICATIONS

Most medications used to treat pulmonary hypertension have a high pH and if left running through a peripheral line too long (greater than 4 hours) may cause peripheral vein phlebitis and sclerosis. Please document the time the medication was initiated through the peripheral line and alert treating Emergency staff.

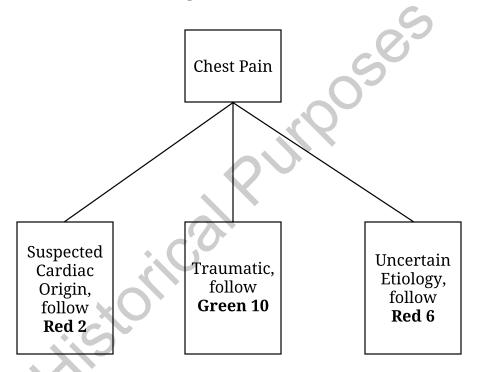

For any questions, please contact On-Line Medical Control.

Page 27 Blue 12

Chest Pain - General

For all patients with chest pain, evaluation for acute coronary syndrome should occur. Commonly, it is difficult with the tools available to EMS providers to completely rule out a cardiac cause of chest pain. Therefore, all patients should be transported for emergency medical evaluation. Cardiac disease is but one of the many causes of chest pain and the EMS provider should consider various causes such as esophageal, chest wall, pulmonary embolism, aortic dissection, spontaneous pneumothorax, etc. Patients commonly fall into one of three categories: suspected cardiac, traumatic, or uncertain cause of chest pain.

***The cardiac monitor/defibrillator should be brought to the patient's side during the initial assessment. ***

Consider cardiac origin chest pain in the following:

- Chest pain or discomfort in other areas of the body (i.e. arm, jaw, epigastrium), shortness of breath, sweating, nausea, vomiting and dizziness.
- Atypical or unusual symptoms are more common in women, the elderly and diabetic patients. May also present with CHF, syncope and/or shock.

Page 28 Red 1

Chest Pain - Suspected Cardiac Origin #1

- Avoid nitroglycerin in any patient who has used a phosphodiesterase inhibitor within the past 48 hours. Examples are:
 - sildenafil (Viagra, Revatio), vardenafil (Levitra, Staxyn), tadalafil (Cialis, Adcirca) which are used for erectile dysfunction and pulmonary hypertension
 - epoprostenol (Flolan) or treprostinil (Remodulin) which are used for pulmonary hypertension.
- Administer nitrates with caution as hypotension can occur in *any* patient having an MI

E EMT

- 1. Administer O_2 only to patients with dyspnea, hypoxia (SpO₂ less than 94%) or signs of heart failure at a rate to keep O_2 sats greater than or equal to 94% and less than 99% (avoid hyperoxia)
- 2. Treat for shock if indicated
- 3. Request ALS
- 4. If patient has not taken an <u>aspirin</u>, administer chewable aspirin 324 mg **PO**, if not contraindicated by allergy
- 5. Contact OLMC for the OPTION of assisting with the administration of patient's own nitroglycerin

ADVANCED EMT

- 6. IV en route
- 7. Cardiac monitor and 12-lead ECG within the <u>first 10 minutes</u> of patient contact, if so trained (AEMTs are not certified to interpret the 12-lead ECG or change the ALS response based on obtaining a 12-lead ECG. The purpose of the AEMT in obtaining the ECG is to present it to the Paramedic and/or receiving facility)
- 8. Contact OLMC for administration of nitroglycerin 0.4 mg tab **SL** or 1 **SL** spray. May repeat two times at 5 minute intervals if BP is greater than 100 mmHg. If the patient has had nitroglycerin before and no IV is established, and systolic BP is greater than 100 mmHg, then it is OK to give nitroglycerin

PARAMEDIC

- 9. Paramedic may perform all treatments above without medical control
- 10. Obtain 12-lead ECG within <u>first 10 minutes</u> of patient contact

If patient meets **STEMI** criteria, refer to local or regional cardiac systems of care for destination decision support and contact OLMC at receiving hospital to alert of impending arrival (local hospital notification) and go to **Red 3**.

Have defib pads ready as these patients are high risk for VF/VT

11. Patients who present with inferior MI, clear lung sounds, and BP less than 90 mmHg, give fluid bolus of NS

(Continued)

P

Α

Page 29

Red 2

Chest Pain - Suspected Cardiac Origin #2 & STEMI Criteria

PARAMEDIC (cont)

- 11. Contact OLMC for OPTIONS
 - a. Additional nitroglycerin
 - b. Fentanyl 1 mcg/kg **IV/IM**, or **IN** to a maximum dose of 100 mcgs
 - c. Additional fluid bolus in patients with inferior MI
- 12. If patient develops a dysrhythmia, refer to appropriate protocol

Inferior MIs and right-sided MIs are commonly associated with bradycardia and blocks.

Hypotension may occur in any MI, not just inferior MIs with right ventricular involvement.

STEMI Criteria

- 1. Septal (V1, V2), Anterior (V3, V4), Inferior (II, III, aVF) or Lateral MI (I, aVL, V5, V6): ST elevation greater than 1 mm in two or more anatomically contiguous leads with reciprocal changes
- 2. Posterior MI: ST depression greater than 1 mm in V1, V2 (and possibly V3) with an R/S ratio of greater than or equal to 1, place posterior leads to evaluate for ST segment elevation in leads V7/V8/V9

New LBBB is no longer criteria for STEMI (Presence of any LBBB inhibits diagnosis of MI)

P

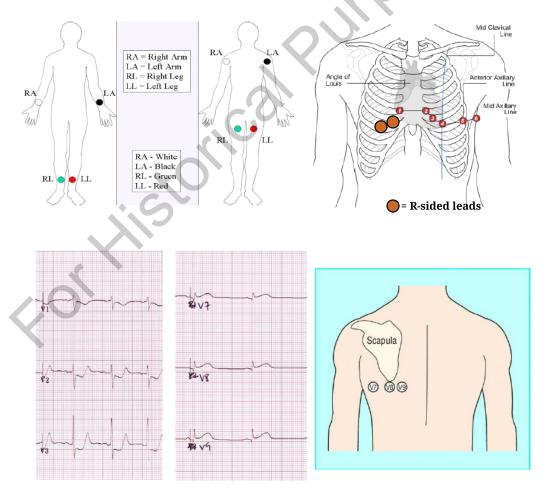

Page 30 Red 3

Guidelines to the Prehospital Use of 12-Lead ECG by the ALS Provider

- 1. Prehospital 12-lead ECG is now a standard of care for increasing diagnostic information regarding the chest pain/cardiac arrest patient
- 2. Acquisition of a 12-lead ECG should be done in all patients with chest pain or a potential cardiac complaint/diagnosis such as syncope or shortness of breath. Given the frequency of atypical presentation in the elderly, responders must have a high index of suspicion in the elderly patient
- 3. Transmission of 12-lead ECG or presentation of prehospital 12-lead ECG to treating providers at the receiving ED is intended to augment patient triage and facilitate rapid identification of a potential thrombolytic or PTCA candidate
- 4. In the case of STEMI, notify the receiving ED immediately

Advanced EMT and the Use of 12-lead ECGs

AEMTs are not certified to interpret the 12-lead ECG or change the ALS response based on obtaining the 12-lead ECG. The purpose of the AEMT in obtaining the 12-lead ECG is to present it to the Paramedic and/or receiving facility.

Consider Posterior Leads for suspected posterior MI

Page 31 Red 4

Chest Pain Fibrinolytic Checklist

For chest pain of suspected cardiac origin, initiate therapy per protocol, including the early use of aspirin and nitroglycerin if not contraindicated.

Use this checklist or local equivalent if available.

Report the information as soon as practical to the receiving ED.

You may copy and use this page as your checklist, or you may use a checklist recommended by your usual receiving hospital which contains at least these questions.

Please follow your destination institution's PCI STEMI Checklist

Has pain persisted for greater than 15 min and less than 12 hours?		NO
Is systolic BP less than 180 mmHg?		NO
Is diastolic BP less than 100 mmHg?		NO
History of structural CNS disease (i.e. AV malformation)		NO
Significant closed head/facial trauma within previous 3 months?		NO
Surgery or major trauma, GI/GU bleed in preceding 2 weeks?		NO
Any history of intracranial hemorrhage?		NO
Any bleeding, clotting problem, or blood thinners?		NO
Pregnant?		NO
Serious systemic disease (i.e. advanced cancer, severe liver or kidney disease?		NO

Page 32 Red 5

Chest Pain - Uncertain Etiology

For ALL patients with chest pain, consider the possibility of cardiac disease no matter what the history and physical suggest. However, there are other sources of non-cardiac chest pain to consider such as pulmonary embolism, spontaneous pneumothorax, aortic dissection/aneurysm, esophageal, chest wall, etc.

If trauma suspected, refer to the Chest Trauma protocol, Green 10.

EMT:

- 1. Administer O_2 only to patients with dyspnea, hypoxia (SpO₂ less than 94%) or signs of heart failure at a rate to keep O_2 sats greater than or equal to 94% and less than 99% (avoid hyperoxia)
- 2. Transport in position of comfort
- 3. Request ALS

ADVANCED EMT

- 4. Establish IV at TKO
- 5. Request Paramedic
- 6. Cardiac monitor and 12-lead ECG if so trained (AEMTs are not certified to interpret the 12-lead ECG or change the ALS response based on obtaining an 12-lead ECG. The purpose of the AEMT in obtaining the 12-lead ECG is to present it to the Paramedic and/or receiving facility)

PARAMEDIC

- 7. If 12-lead ECG indicates STEMI, refer to **Red 2 & 3**
- 8. For non-traumatic chest pain in a stable patient with a normal level of consciousness and no evidence of STEMI or Acute Coronary Syndrome, contact OLMC for the following options:
 - a. If appropriate: administration of fentanyl 1 mcg/kg **IV/IM/IN** to a maximum dose of 100 mcgs
 - b. For nausea and vomiting, refer to Gold 15

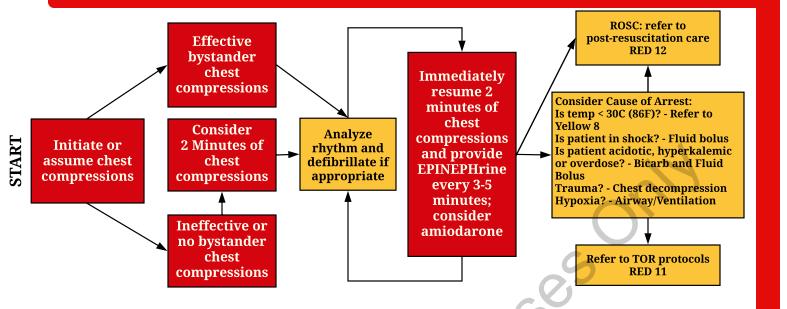

Page 33 Red 6

E

A

P

Cardiac Arrest Overview

Manage airway as appropriate. Consider basic measures first OR advanced airway without interruption of chest compressions.

CARDIAC ARREST CHECKLIST	
Code leader and roles identified (pre-arrival)	
Continuous chest compressions with minimal interruption (compress while defib charging) and full recoil	
Turn on CPR feedback device/metronome with goal of 100-120 compressions/minute	
Rotate compressors at least every 2 minutes	
AED/Defib applied and monitored	
O ₂ flowing and attached to NR/BVM	
ETCO ₂ waveform present & monitored	
IV/IO established	
Possible causes considered	
Consult OLMC early to discuss complex cases	
Gastric insufflation limited and gastric decompression considered	
Family present and ongoing communication/support provided	

Evaluate for all potential causes of cardiac arrest, including the 5 **H's** (Hypothermia, Hypovolemia, Hypoxia, Hypo/hyperkalemia, H+ ion or acidosis) and the 5 **T's** (Cardiac Tamponade, Tension Pneumothorax, Thromboembolic disease x 2 (i.e.pulmonary embolism/MI) and Toxins). Prior to termination of cardiac arrest, address potential causes of arrest, including effective management of patient airway, provision of fluid bolus, and consideration of bicarb in possible toxic, acidotic, or hyperkalemic patients. Please note, patients on dialysis are at risk for electrolyte abnormalities. Finally, consider needle decompression for tension pneumothorax if appropriate.

Page 34 Red 7

Cardiac Arrest #1

EMT

- 1. Initiate CPR until AED arrives unless valid DNR or signs incompatible with life are present, refer to Termination of Resuscitation protocol, **Red 11**
- 2. Attach AED as soon as available with minimal interruptions in chest compressions and follow AED prompts
- 3. Place oral and/or nasal airway(s)
- 4. High-flow O_2 with BVM ventilation 1 breath every 10 chest compressions during recoil and without interrupting compressions
- 5. Request ALS
- 6. Continue 2-minute cycles of chest compressions and AED checks
- 7. If ROSC occurs, refer to Post-Resuscitation Care protocol, **Red 12**
- 8. Consider termination of resuscitation, refer to **Red 11**

ADVANCED EMT

- 9. Establish **IV/IO** without interrupting chest compressions
- 10. Manage the airway per **Blue 3 or Blue 5**. Avoid respiratory rate greater than 10/minute in cardiac arrest
- 11. Defibrillate as indicated

PARAMEDIC

- 12. One medication intervention at each 2-minute reassessment per ACLS protocol
- 13. EPINEPHrine 1 mg of 1 mg/10 mL (1:10,000) **IV/IO** push every 3-5 minutes
 - a. VT/VF: amiodarone 300 mg **IV/IO** push, may consider additional 150 mg **IV/IO** one time
 - b. Torsades: 2 grams of magnesium sulfate IV/IO
 - c. For refractory VF/VT (total of 5 shocks, dose of EPINEPHrine and amiodarone), refer to **Red 10**
- 14. Consider causes of OHCA:
 - Is patient on dialysis, have known renal disease or suspicion for hyperkalemia?
 - b. Is patient suspected TCA overdose?
 - c. Is there a suspected pre-existing metabolic acidosis?

***if yes to any of the above, then: ***

- i. Sodium bicarbonate 50 mEq bolus **IV/IO**, may repeat x 2
- ii. IV fluid bolus
- d. Is hypovolemia suspected? If yes, give fluid bolus
- e. Is hypoxia suspected? If yes, administer high-flow oxygen and manage airway per **Blue 3 or Blue 5**
- f. Do you suspect a pneumothorax? If yes, perform needle decompression
- g. Is patient's core temperature less than 30°C (86°F) and circumstances consistent with hypothermia? If yes, see Hypothermia #2 protocol, **Yellow 8**
- 15. Upon ROSC:
 - a. Refer to Post-Resuscitation Care Protocol, **Red 12**
 - b. Contact OLMC for options of:
 - i. Post-resuscitation amiodarone bolus
 - ii. Post-resuscitation amiodarone drip

A

E

P

Cardiac Arrest #2

Effective chest compressions and defibrillation are the most important therapies to the patient in cardiac arrest. Effective chest compressions are defined as:

- a. A rate of greater than 100 120 compressions/minute
- b. Depth of between 2-2.5 inches
- c. Allow for complete chest recoil
- d. Minimize interruptions in compressions
- e. Rotate rescuers every 2 minutes
- f. Avoid excessive ventilation. Ventilations should not exceed 8-10 breaths per minute
- g. Quantitative end-tidal CO_2 should be used to monitor effectiveness of chest compressions. If $ETCO_2$ is < 10 mmHg, attempt to improve chest compression quality
- h. Consider additional monitoring with biometric feedback

Resuscitate on scene as the effectiveness of chest compressions decreases during any patient movement. Resuscitation on scene should be the goal, with the only exceptions being safety concerns for the responding crew OR inability to effectively resuscitate in the patient's current location.

All services MUST have an organized and structured response to the care of patients in cardiac arrest. This approach must be pre-arranged and may be modeled on the Maine EMS ICS for OHCA Program or other well-accepted structured approach to patient care. Also, EMS services are encouraged to train providers to these systems of care and to regularly train providers in high-performance CPR.

Use capnography during resuscitation for confirmation and monitoring of advanced airways and for prolonged use of BVM as well as monitoring effectiveness of chest compression and return or loss of spontaneous circulation.

Note: The algorithms for cardiac arrest or arrhythmias reflect the MEMS Medical Direction and Practices Board's interpretation of ACLS guidelines, as they should be used in the prehospital setting.

In the case of peripartum cardiac arrest, provision of high-quality CPR remains a priority. If a patient's fundus height is at or above the level of the umbilicus, manual left uterine displacement is the preferred method of relieving aortocaval compression during chest compressions. Additionally, local hospital resources for advanced care should be activated immediately upon recognition of peripartum cardiac arrest. Contact OLMC to discuss the potential of additional therapies.

Page 36 Red 9

Refractory VF/VT

Prior to attempting double-sequential defibrillation (DSD), at least one shock should be given at maximal energy using a <u>different vector</u>. i.e. apply a new set of pads in the anterior-apex position if anterior-posterior has failed. Do not allow the pads to touch one another (see diagram below).

DOUBLE-SEQUENTIAL DEFIBRILLATION:

This can only be performed with MANUAL defibrillators.

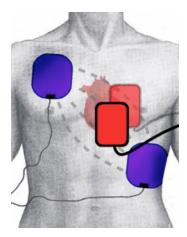

****Check with the manufacturers of your manual defibrillators re: the warranty if used in double-sequential defibrillation****

INDICATION: refractory VF/VT after 5 unsuccessful shocks (with vector change), administration of EPINEPHrine and amiodarone.

- **Recurrent VF/VT** is defined as SUCCESSFULLY CONVERTED by standard defibrillation techniques but subsequently returns. It should NOT be treated by DSD. It is managed by treatment of correctable causes and use of anti-arrhythmic medications in addition to standard defibrillation.
- **Refractory VF/VT** is defined as NOT CONVERTED by standard defibrillation. It is initially managed by treating correctable causes with anti-arrhythmic medications. If these methods fail to produce a response, DSD may be beneficial.

PROCEDURE:

- 1. Assure that controls for the second manual defibrillator are accessible to the team leader
- 2. Verify that both cardiac manual defibrillators are attached to the patient, that all pads are well-adhered, and simultaneously charge both manual defibrillators
- 3. When both defibrillators are charged to maximum energy settings and all persons are clear, push both shock buttons as synchronously as possible
- 4. May repeat procedure every 2 minutes as indicated if refractory VF/VT persists

http://emssolutionsint.blogspot.com/2015/02/double-sequential-external.htmL

Page 37 Red 10

Termination of Resuscitation

Resuscitation should be withheld under the following circumstances:

- When it is found that the patient has a DNR order or other actionable medical order (i.e. POLST/MOLST, etc.) form
- Scene Safety: the physical environment is not safe for the provider(s)
- When irreversible signs of death, such as dependent lividity, pupils fixed and dilated, palpable hypothermia (not from exposure) and no audible heart sounds are noted in patient with unknown downtime or downtime > 20 minutes in a witnessed arrest without bystander CPR

Resuscitation may be terminated:

- When the patient regains pulse/respirations
- When the rescuers are physically exhausted or when equally or more highly trained healthcare personnel take over
- In the absence of ALS, when the same Maine EMS licensed crew member has
 determined the absence of vital signs for 20 minutes, in spite of BLS, except in
 the case of hypothermia, see Yellow 8
- When it is found that the patient has a DNR order or other actionable medical order (i.e. POLST/MOLST, etc.) form
- When the following time frames have been met for ALS providers alone:
 - Persistent asystole x 20 minutes
 - Slow and/or wide complex PEA x 20 minutes
 - Fast/narrow PEA x 45 minutes
 - VF/Pulseless VT x 60 minutes
- If ALS providers arrive on scene of a patient managed by BLS providers, consider TOR if:
 - After a total (BLS + ALS) resuscitation time of 20 minutes, the AED has never advised shock AND the first rhythm noted by ALS providers is asystole or slow/wide PEA
 - If patient is found in fast/narrow PEA does not achieve ROSC after 45 minutes of ALS + BLS care
 - If the patient is found in VF/Pulseless VT does not achieve ROSC after 60 minutes of ALS+BLS care
 - In the case of fast/narrow PEA and VF/Pulseless VT, the ALS provider must complete the ALS algorithm as dictated in these protocols prior to consideration of TOR, regardless of time frame

*Survival and functional neurologic outcomes are unlikely if ROSC is not obtained by EMS. It is dangerous to crew, pedestrians and other motorists to attempt to resuscitate a patient during ambulance transport. If circumstances do not allow TOR for safety or other reasons, notify OLMC.

If Resuscitative Efforts are terminated:

- 1. Focus attention on the family or bystanders. Explain the rationale for termination
- 2. Consider accessing support for family: other family, friends, or social support such as clergy
- 3. If termination of resuscitation occurs, one must consider management of patient's remains. No one option is correct for all circumstances and factors on scene will likely dictate the best option. Refer to **Grey 4**. If questions remain regarding disposition of the patient's remains, contact OLMC

Page 38 Red 11

Adult Post-Resuscitation Care

E

EMT

- 1. Manage airway with goal to keep O_2 sat greater than or equal to 94%. Avoid excessive ventilations and hyperoxia. Maintain ventilation rate between 10-12 breaths per minute
- 2. Request ALS

ADVANCED EMT

3. Provide advanced airway management if indicated and initiate capnography. Avoid excessive ventilation. Aim for ventilation rate between 10-12 breaths per minute

A

P

- 4. Obtain IV access and treat hypotension with fluid boluses. Goal systolic BP after ROSC is greater than or equal to 90 mmHg. For post-resuscitation hypotension, administer Normal Saline boluses. Total volume should not exceed 2000 mL
- 5. Perform 12-lead ECG, if so trained

PARAMEDIC

Goal #1 - Identify STEMI

6. If evidence of STEMI persists on 12-lead ECG, refer to STEMI protocol, **Red 2** and follow local STEMI referral patterns

Goal #2 - Aggressive management of hypotension

7. Goal systolic BP after ROSC is greater than or equal to 90 mmHg. For post-resuscitation hypotension, administer Normal Saline boluses. Total volume should not exceed 2000 mL

8. If hypotension persists, contact OLMC for the following OPTION:

- a. NOREPInephrine IV infusion:
 - i. **Preparation** mix NOREPInephrine 8 mg in 250 mL NS
 - ii. **Dosing** starting dose of NOREPInephrine is 0.03 mcg/kg/mi Titrate by 0.03 mcg/kg/min every 3-5 minutes. Usual dose is 0.03 - 0.25 mcg/kg/min. Usual max dose is 0.6 mcg/kg/min. Absolute max dose is 3 mcg/kg/min

b. Titrate to maintain systolic BP greater than 90 mmHg

- c. NOREPInephrine infusions in adults and pediatrics must be administered via a Maine EMS-approved medication pump
- 9. If seizure develops, refer to Adult Seizure protocol, **Gold** 7
- 10. If patient suffers loss of spontaneous circulation and re-arrests, refer to appropriate guideline

Page 39 Red 12

Tachycardia #1

NOTE: For all cases, attempt to identify and treat the underlying cause of the patient's tachycardia which may include maximizing oxygenation or (for Advanced EMTs/Paramedics) maximizing hemodynamics. If uncertainty exists between sinus tachycardia and SVT, please contact OLMC.

E

EMT

- 1. Airway management per **Blue 3 or 5**
- 2. Request ALS

Α

ADVANCED EMT

- Establish IV/IO
 Cardiac monitor, perform 12-lead ECG, if so trained
- 5. Request Paramedic

PARAMEDIC

If hemodynamically UNSTABLE as manifested by any of the following: hypotension, altered mental status, syncope/pre-syncope, chest pain, dyspnea, acute heart failure, signs of shock:

- 6. Consider **synchronized** cardioversion
 - a. <u>Narrow complex</u> 50-100J or biphasic equivalent. Subsequent attempts if needed progress to 100J, then 200J, then 300J, 360 J (or biphasic equivalents)
 - b. Wide Complex 360 J or biphasic equivalent
 - c. Consider sedation with midazolam 3 mg **IV/IO/IN or** fentanyl 1 mcg/kg **IV/IO/IN** to max of 100 mcg in initial dose
 - d. If unable to synchronize or in the case of patient instability or polymorphic VT, defibrillate x 1 at 360J or biphasic equivalent

P

- 7. Rate control for <u>A-Fib/A-Flutter</u> ONLY, contact OLMC for option of metoprolol 5 mg **IV** over 5 minutes. REMEMBER, *metoprolol must not be used in hypotension*
 - a. Repeat with metoprolol 5 mg **IV** over 5 minutes after consult with OLMC
- 8. Contact OLMC for further options, including amiodarone drip (for wide complex tachycardia)

If hemodynamically STABLE

For narrow complex tachycardia (with a heart rate persistently greater than 150 bpm):

- a. Valsalva maneuver
- b. Adenosine 6 mg **IV** rapid bolus at centrally located peripheral IV with rapid saline flush (may repeat adenosine x 1 at 12 mg **IV** rapid bolus at centrally located peripheral IV with rapid saline flush)

Page 40 Red 13

Tachycardia #2

Hemodynamically stable (continued)

For wide complex tachycardia

Only for regular rhythm with MONOmorphic QRS:

- 12. Adenosine 6 mg **IV** rapid bolus at centrally located peripheral IV with rapid saline flush
 - a. May repeat adenosine x 1 at 12 mg IV rapid bolus at centrally located peripheral IV with rapid saline flush
- 13. Consider amiodarone 150 mg IV/IO over 10 minutes

For POLYmorphic wide complex tachycardia (Torsades de Pointes)

14. Contact OLMC for magnesium sulfate 1-2 grams IV over 5 minutes

Treatment of pre-excitation rhythms (such as WPW) include blocking at the level of the AV node, using adenosine or beta-blockers. Patients with *pre-excitation AND A-fib* should **NOT** receive any agents that block the AV node, as this could cause VF. WPW with A-fib may be recognized by a very fast rhythm, a predominance of wide QRS complexes with occasional narrow complexes and an irregular rhythm. When WPW with A-fib is suspected, the patient should **NOT** receive any medications that block the AV node because this will force all impulses through the accessory pathway and can cause VF. *Instead*, *these patients should be cardioverted when they become unstable*.

Do **NOT** give adenosine to a patient with Polymorphic VT or Torsades.

Do **NOT** give amiodarone to a patient converted from Polymorphic VT unless QT interval is less than 0.500 sec.

If QT interval is greater than 0.500 sec, contact OLMC for options.

Page 41 Red 14

Bradycardia #1 Heart rate less than 50 beats/min

Concerning signs or symptoms: hypotension, altered mental status, syncope/presyncope, chest pain, dyspnea, acute heart failure, signs of shock, or cyanosis/pallor:

If NO concerning signs or symptoms, then all levels (EMT/Advanced EMT/Paramedic) may do the following:

- 1. O₂ as appropriate
- 2. Advanced EMT/Paramedic ONLY consider fluid bolus

If ANY concerning signs or symptoms, then: EMT

- 1. O₂ as appropriate
- 2. Request ALS

ADVANCED EMT

E

Α

P

- 3. IV en route and fluid bolus as required
- 4. Cardiac monitor, perform 12-lead ECG, if so trained
- 5. Request Paramedic

PARAMEDIC

- 6. Atropine 0.5 mg **IV/IO***,**; give in repeat doses every 3-5 minutes up to a maximum dose of 0.04 mg/kg** (or up to a total of 3 mg in the adult patient)
- 7. Apply external pacer—Initiate transcutaneous pacing (TCP) for patients who do not respond to atropine; if serious signs or symptoms, do not delay TCP while awaiting IV/IO access or for atropine to take effect. Consider premedicating with midazolam 3 mg IV/IN/IO OR fentanyl 1 mcg/kg IV/IN/IO to a maximum first dose of 100 mcg. Notify OLMC as soon as possible
- 8. If continued signs or symptoms, then contact OLMC for options of the following:
 - a. Repeat atropine
 - b. NOREPInephrine IV infusion (8 mg in 250 mL NS)
 - i. Preparation mix NOREPInephrine 8 mg in 250 mL NS
 - ii. Dosing Starting dose is NOREPInephrine 0.03 mcg/kg/min. Titrate by 0.03 mcg/kg/min every 3-5 minutes. Usual dose is 0.03-0.25 mcg/kg/min. Usual max dose is 0.6 mcg/kg/min. Absolute max dose is 3 mcg/kg/min
 - iii. Titrate to maintain systolic BP greater than 100 mmHg
 - iv. NOREPInephrine infusions in adults and pediatrics must be administered via a Maine EMS-approved medication pump
- * Transplanted, denervated hearts will not respond to atropine. Proceed to pacing, catecholamine infusion, or both*
- ** Atropine should be used with caution in 2^{nd} degree Type II AV block and new 3^{rd} degree AV block with wide QRS complexes**

Page 42 Red 15

Bradycardia #2 Heart rate less than 50 beats/min

PEARLS for Bradycardia:

Consider causes of bradycardia:

MI, hypoxia, pacemaker failure, hypothermia, sinus bradycardia, sick sinus syndrome, AV blocks, overdose (calcium channel blockers, beta-blockers, digoxin, organophosphates), hyperkalemia (in wide complex).

Application of **TCP** should be considered if deterioration is anticipated because of the following:

- a. Observed sinus pauses
- b. Episodes of 2nd degree Type II, or 3rd degree AV Block

Pre-medication for TCP is preferably via the IV route. If unable to obtain IV, may try IN route in the cooperative patient with goal of ultimately obtaining IV/IO access.

Page 43 Red 16

Cardiogenic Shock

Ε

EMT

- 1. O₂ as appropriate
- 2. Request ALS

ADVANCED EMT

- 3. Cardiac monitor, obtain 12-lead ECG, if so trained
- 4. IV en route
- 5. Request Paramedic

A

- 6. Contact OLMC with following information:
 Vital signs, lung sounds, cardiac rhythm, pedal edema assessment for OPTION OF:
 - a. Fluid bolus

PARAMEDIC

- 7. Contact OLMC for the following OPTION:
 - a. NOREPInephrine IV infusion:
 - i. Preparation mix NOREPInephrine 8 mg in 250 mL NS.
 - ii. Dosing Starting dose is NOREPInephrine 0.03 mcg/kg/min. Titrate by 0.03 mcg/kg/min every 3-5 minutes. Usual dose is 0.03-0.25 mcg/kg/min. Usual max dose is 0.6 mcg/kg/min. Absolute max dose is 3 mcg/kg/min
 - b. Titrate to maintain systolic BP greater than 100 mmHg
 - c. NOREPInephrine infusions in adults and pediatrics must be administered via a Maine EMS-approved medication pump

P

PEARLS for Cardiogenic Shock

• Pediatric patients suffering from suspected cardiogenic shock should receive fluid boluses of 10 mL/kg with frequent reassessment for tolerance and need for additional fluids.

Page 44 Red 17

Syncope

EMT

- 1. Obtain history (seizure, stroke, fluid loss, palpitations, chest pain, dizzy, trauma) and consider spinal immobilization if appropriate
- 2. O_2 as appropriate
- 3. Perform finger stick to measure blood glucose, if so trained. If blood glucose less than 60 mg/dL, refer to Adult Diabetic/ Hypoglycemic Emergencies protocol, **Gold 6**
- 4. Treat for shock if appropriate. If the cause of the shock is:
 - a. Anaphylaxis, refer to Anaphylaxis protocol, Gold 1
 - b. Cardiogenic, refer to Cardiogenic Shock protocol, Red 17
 - c. Tension Pneumothorax, see Chest Trauma protocol, **Green 10**
 - d. Medical Shock, see Medical Shock protocol, Gold 12
- 5. Request ALS

A P

E

ADVANCED EMT/PARAMEDIC

- 6. Establish IV access
- 7. Cardiac monitor and 12-lead ECG, if so trained
- 8. Fluid bolus if appropriate
- 10. AEMT to request Paramedic

NOTE: At any time, if relevant signs/symptoms found, go to appropriate protocol

PEARLS for Syncope

- * Syncope is defined as loss of consciousness accompanied by loss of postural tone.
- * All of these patients should be transported for emergency evaluation.
- * More than 25% of geriatric syncope is cardiac dysrhythmia based.
- * 12-lead ECGs and cardiac monitoring are important for this patient population. The ECG should be evaluated for potential causes of syncope such as: ischemia, QT prolongation, Brugada Syndrome, pre-excitation, arrhythmia and hypertrophic cardiomyopathy.

A NORMAL ECG DOES NOT RULE OUT CARDIAC CAUSE OF SYNCOPE

- * Because of proximity to the event, EMS providers may be the only providers able to capture cardiac causes of syncope.
- * Consider other causes including GI bleed, ectopic pregnancy, seizure, stroke, hypoglycemia, shock, toxicologic (i.e. alcohol), and medications.

Page 45 Red 18

Ventricular Assist Devices #1

Patient Care Goals

- Rapid identification of, and interventions for, cardiovascular compromise in patients with VADs
- Rapid identification of, and interventions for VAD-related malfunctions or complications

Inclusion Criteria

E A

• Any patient with a Ventricular Assist Device

Patient Management

- 1. Assess for possible pump malfunction
 - a. Assess for alarms
 - b. Auscultate for pump "hum" sound (best heard in the left chest)
 - c. Assess for signs of hypoperfusion including pallor, diaphoresis, altered mental status
- 2. If the VAD pump has malfunctioned:
 - a. Utilize available resources to troubleshoot potential VAD malfunctions and to determine appropriate corrective actions to restore normal VAD function
 - i. Contact the patient's VAD-trained companion, if available
 - ii. Contact the patient's VAD-coordinator, using the phone number on the device
 - iii. Check all connections to the system controller
 - iv. Change VAD batteries, and/or change the system controller if indicated
 - v. Have the patient stop all activity and assess for patient tolerance
 - vi. Follow the appropriate protocol for the patient's presenting complaint
- 3. If the patient is experiencing VAD-related complications or cardiovascular problems, expedite transport to the medical facility where the VAD was placed if the patient's clinical condition and operational considerations allow. If direct transport to the patient's VAD center is not possible, take the patient to the most appropriate facility based on their clinical condition, notifying **OLMC** and the patient's VAD coordinator of destination decisions
 - a. If patient has a functioning VAD and is experiencing a non-cardiovascular-related problem, transport to a facility that is appropriate for the patient's main presenting problem without manipulating the device
- 4. If the patient is in cardiac arrest
 - a. CPR should NOT be performed if there is any evidence the pump is still functioning. The decision whether to perform CPR should be based upon best clinical judgment. Consult OLMC **or** the patient's VAD coordinator for questions
 - b. CPR is indicated only when:
 - i. The patient's pump has stopped and troubleshooting efforts to restart the pump have failed, **AND**
 - ii. The patient is unresponsive with no detectable signs of life
- 5. Manage the patient's airway as indicated by **Blue 3 or Blue 5**

Page 46 Red 19

Ventricular Assist Devices #2

- 6. Establish IV/IO access based on the patient's acuity and provider judgment
- 7. Place the patient on a cardiac monitor
- 8. Perform 12-lead ECG

PEARLS for VADS

- You do not need to disconnect the controller or batteries in order to defibrillate or cardiovert.
- You do not need to disconnect the controller or batteries in order to acquire a 12-lead ECG.
- Automatic non-invasive cuff blood pressures may be difficult to obtain due to the narrow pulse pressure created by the continuous flow pump.
- Flow though many VAD devices is not pulsatile and patients may not have a palpable pulse or accurate pulse oximetry. The blood pressure, if measurable, may not be an accurate measure of perfusion. Although automatic non-invasive blood pressure cuffs are often ineffective in measuring systolic and diastolic pressure, if they do obtain a measurement, the MAP is usually accurate. Doppler's may be more accurate at determining both pulse and blood pressure and, if available, should be used.
- Patient may be awake with a functioning pump in VF, VT, PEA or asystole. If the patient is responsive AND the encountered rhythm is thought to be new, ACLS therapies, including defibrillation may be attempted, however chest compressions are not necessary if the patient is awake and alert. Evaluate clinical condition and provide care in consultation with VAD coordinator.
- The patient's emergency travel bag should accompany him/her at all times. If feasible, bring the patient's Power Module, cable and Display Module with patient to the hospital.
- The most common cause for VAD alarms are low batteries or battery failures
- Primary pump failure is a very rare occurrence. The most common VAD complications, in descending occurrence, are:
 - Infection
 - Bleeding
 - Arrhythmias
 - CHF
 - Aortic Insufficiency
 - Stroke/TIA
 - Cardiac Tamponade
- Follow the protocol most appropriate, based on the patient's clinical condition.
- For questions, contact OLMC and the patient's VAD Coordinator.
- All patients with a VAD are anticoagulated, typically with warfarin (Coumadin).

Page 47 Red 20

EMT

- 1. Manage airway as appropriate see Blue 3 & Blue 5
- 2. If shock present, refer to Medical Shock protocol, Gold 12
- 3. If anaphylaxis identified, assist administration of patient's own EPINEPHrine auto-injector, administer an adult or pediatric (as applicable) auto-injector, or provide EPINEPHrine through the Maine EMS Check and Inject program in the anterolateral thigh if the service is authorized and the personnel so trained:
 - a. Adult: EPINEPHrine 0.3 mg **IM** [0.3 mL of 1mg/mL (1:1,000)]in anterolateral thigh, or
 - b. Pediatric dose of EPINEPHrine which is as follows: < 25 kg, 0.15 mg IM [0.15mL of 1mg/mL (1:1,000)], > 25 kg, 0.3 mg IM [0.3 mL of 1mg/mL (1:1,000)] IM in anterolateral thigh
- 4. Request ALS if available
- 5. Consider local measures to prevent absorption

ADVANCED EMT

- 6. If anaphylaxis identified:
 - a. Adult: EPINEPHrine 0.3 mg IM [0.3 mL of 1mg/mL (1:1,000)] in anterolateral thigh, or
 - b. Pediatric dose of EPINEPHrine which is as follows: < 25 kg, 0.15 mg IM [0.15mL of 1mg/mL (1:1,000)], > 25 kg, 0.3 mg IM [0.3 mL of 1mg/mL (1:1,000)] IM in anterolateral thigh
- 7. IV en route
- 8. Cardiac monitor
- 9. If shock present, perform fluid bolus
- 10. Contact OLMC for repeated **IM** EPINEPHrine doses every 5-15 min & call for a Paramedic
- 11. If wheezing persists 5-15 minutes after first dose of EPINEPHrine contact OLMC for consideration of Albuterol

For patients with minor symptoms only or resolution of symptoms with a single dose of EPINEPHrine the AEMT, in consultation with OLMC, may consider activating the ALS Cancellation Policy.

PARAMEDIC

- 12. Consider glucagon 1 mg **IV** q 5 minutes for patients taking beta-blockers and not responsive to EPINEPHrine
- 13. Diphenhydramine (Benadryl)
 - a. Adult: 25-50 mg **IV/IO/IM**
 - b. Pediatric: 1-2 mg/kg IV/IO/IM (max dose 50 mg)
- 14. Albuterol 2.5 mg by nebulization; Consider repeat x 1 as needed or nebulizer of 1 mL of 1mg/mL (1:1,000) EPINEPHrine in 2 mL of normal saline

(Continued)

Α

E

P

16. Contact OLMC for repeat IM EPINEPHrine every 5 minutes and/or EPINEPHrine IV infusion for shock or cardiovascular compromise, which may typically be dosed the following way:

Preparation - Add 1mL (1mg) EPINEPHrine 1mg/mL (1:1000) to 250 mL bag NS. This results in a 1 mg/250 mL = 4 mcg/mL mix.

Dose - Start at 0.05 mcg/kg/min. Titrate by 0.05 mcg/kg/min every 5 min. Titrate to desired blood pressure.

Usual dose is 0.05- $0.\overline{5}$ mcg/kg/min. Absolute maximum dose is 0.5 mcg/kg/min. This must be performed under OLMC and only with a pump.

PEARLS for Allergy/Anaphylaxis

P

Children with a known recent exposure to common triggers of allergic reactions (peanuts, medications, bee stings) should be considered at risk for having an allergic reaction or anaphylaxis.

Children with asthma should be considered high risk for a severe reaction.

Severity should be differentiated between anaphylaxis and non-anaphylaxis (ie: Allergic reaction only). Only patients with anaphylaxis (as defined in **Gold 3**) should receive EPINEPHrine.

Anaphylaxis in children should be treated for those exhibiting hypotension after exposure to a known allergen, respiratory compromise with acute onset of skin or mucosal involvement, or two or more of the following after exposure to a likely allergen: gastrointestinal symptoms, skin/mucosal involvement, respiratory compromise, or hypotension.

Evidence does not support the routine use of cardiac monitoring for patients who receive one dose of EPINEPHrine.

Page 49 Gold 2

PEARLS for Allergy/Anaphylaxis:

- 1. Anaphylaxis is highly likely when any ONE of the following 3 criteria is fulfilled: Acute onset of an illness (minutes to several hours) with involvement of the skin, mucosal tissue, or both (eg, generalized hives, pruritus or flushing, swollen lips-tongue-uvula) AND at least ONE of the following:
 - a. Respiratory compromise (eg, dyspnea, wheezing- bronchospasm, stridor, reduced Peak Expiratory Flow (PEF), hypoxia)
 - b. Reduced BP or associated symptoms of end-organ dysfunction (eg, hypotonia [collapse], syncope, incontinence)

OR

TWO or more of the following that occur rapidly after exposure to a likely allergen for that patient (minutes to several hours):

- a. Involvement of the skin-mucosal tissue (eg, generalized hives, itch- flush, swollen lips, tongue-uvula)
- b. Respiratory compromise (eg, dyspnea, wheeze-bronchospasm, stridor, reduced PEF, hypoxia)
- c. Reduced BP or associated symptoms (eg, hypotonia [collapse], syncope, incontinence)
- d. Persistent gastrointestinal symptoms (eg, crampy abdominal pain, vomiting) several hours):

OR

Reduced BP after exposure to known allergen for that patient (minutes to several hours)

- a. Infants and children: low systolic BP (age specific) or greater than 30% decrease in systolic BP*
- b. Adults: systolic BP of less than 90 mmHg or greater than 30% decrease from that person's baseline
- 2. In every case when anaphylaxis is identified, EPINEPHrine should be provided. The best route of administration is via the **IM** route in the anterolateral thigh
- 3. Patients may require repeated doses EPINEPHrine. Typically, these repeated doses are also provided via the **IM** route
- 4. When errors occur EPINEPHrine delivery, it is commonly due to providers failing to check that they are using the proper concentration of EPINEPHrine. Be careful to recheck when using EPINEPHrine and ensure that the desired concentration is being utilized

Page 50 Gold 3

IV EPINEPHrine infusion drip, utilizing a pump, should be started for patients unresponsive to IM EPINEPHrine administration in either of the following settings:

• Cardiovascular collapse (hypotension with altered mental status, pallor, diaphoresis, or delayed capillary refill)

OR

• Hypotension that is unresponsive to 60 mL/kg isotonic fluid boluses and repeat doses of **IM** EPINEPHrine

Evidence does not support the prophylactic use of EPINEPHrine in the asymptomatic patient, after exposure to a known allergen.

Children experiencing cutaneous signs of an allergic reaction with no systemic symptoms should be evaluated by a medical provider.

Children experiencing anaphylaxis in the prehospital setting who receive EPINEPHrine require EMS transport.

Page 51 Gold 4

Adult Coma (Decreased Level of Consciousness)

Assess for trauma, drugs, diabetes, breath odor, needle tracks, medical alert tags, suspected seizure. Refer to appropriate protocol for specific suspected conditions.

EMT

E

- 1. Immobilize spine if indicated
- 2. Manage airway as appropriate per Blue 3 & Blue 5
- 3. Request ALS if available
- 4. If shock present, refer to Medical Shock protocol, Gold 12 & Pink 14
- 5. Perform finger stick to measure blood glucose, if so trained. If blood glucose is less than 60 mg/dL, refer to **Gold 6 & Pink 13**
- 6. If respirations less than 12 per minute AND narcotic overdose suspected, refer to Antidotes for Specific Toxins: Opiates protocol, **Yellow 5**

Never administer naloxone to a neonate

ADVANCED EMT/PARAMEDIC

- 7. IV en route
- 8. Cardiac monitor

A P

Page 52 Gold 5

Adult Diabetic/Hypoglycemic Emergencies

EMT

- 1. Manage airway as appropriate
- 2. Request ALS if available
- 3. If trained, perform finger stick to measure blood glucose
 - a. If blood glucose is less than 60 mg/dL, and patient is conscious and able to swallow, give glucose orally
- **4. If not trained** to perform and patient is a known diabetic, has a known low blood sugar, or has an altered mental status, and if the patient is conscious and able to swallow, give glucose orally

Glucose paste is to be administered as soon as possible, if the patient is conscious and able to swallow, and presenting with the signs/symptoms of diabetic emergency

ADVANCED EMT

- 5. IV en route
- 6. If blood glucose is less than 60 mg/dL
 - a. If patient is conscious and able to swallow, give glucose orally
 - b. Administer dextrose 25 gm (50 mL of 50% solution **IV** or 250 mL of 10% solution **IV**). Recheck blood glucose in 5 minutes
 - c. If IV unavailable, DO NOT PLACE IO
 - i. Administer glucagon 1 mg IM.
- 7. If blood glucose greater than 300 mg/dL, give NS fluid bolus
- 8. Cardiac monitor
- 9. Repeat glucose measurement in 5 minutes

PARAMEDIC

10. Contact OLMC for OPTION of repeating dextrose, repeating glucagon, or placing an IO. If IO placed, administer dextrose 25 gm (250 mL of $D_{10}W$ via IO)

Pearls for Diabetes/Hypoglycemic Emergencies

- The definition of hypoglycemia has been changed from 80 mg/dL to 60 mg/dL based upon current literature which suggests most patients will experience adrenergic symptoms under 60 mg/dL and CNS symptoms under 50 mg/dL. If a patient's finger stick glucose measurement is above 60 mg/dL and hypoglycemia remains a concern, contact OLMC for options of treatment.
- Goal of fluid bolus in hyperglycemia is to treat hypotension/signs of hypoperfusion as well as decrease blood glucose to less than 300 mg/dL.
- Hypogycemic patients on sulfonylurea class medications (glipizide (Glucotrol), glyburide (Diabeta), etc.) may have refractory hypoglycemia and all require transport, glucose monitoring and hospital evaluation.

A

E

P

Adult Seizure #1

PEARLS for Seizures: Most seizures are self-limited. Unless a specific underlying condition exists (i.e. diabetes with hypoglycemia), treatment of a seizure or multiple seizures with a total duration of less than 5 minutes should focus on patient protection and oxygenation.

EMT

E

Α

- 1. Manage airway as appropriate, see Blue 3
- 2. Spinal immobilization if indicated. Refer to Spine Assessment protocol, Green 6
- 3. Left lateral recumbent position and protect patient from injury
- 4. Request ALS if available
- 5. Perform finger stick to measure blood glucose, if so trained. If blood glucose is less than 60 mg/dL, refer to **Gold 6**

ADVANCED EMT

- 6. Cardiac monitor
- 7. IV en route
- 8. If shock present, refer to Medical Shock protocol, Gold 12

PARAMEDIC

- 9. If the patient has a single seizure lasting greater than 5 minutes OR status epilepticus, administer IM midazolam if no IV is established. If an IV is established, administer midazolam via the **IV** route
 - a. Intramuscular dosing midazolam 10 mg IM
 - b. Intravenous/Intraosseous dosing midazolam 5 mg IV/IO
 - c. If Seizures continue, repeat midazolam 5 mg IV/IO/IM q 5 min until resolution of seizure, or a total of 3 doses of midazolam have been provided (15 mg IV total, 20 mg IM total)
 - i. Contact OLMC if additional midazolam is necessary
 - ii. Monitor oxygenation and ventilation with $\rm O_2$ saturation and End-tidal Capnography, especially if providing repeated doses of midazolam
 - iii. Manage the patient's airway as necessary

P

Page 54 Gold 7

Adult Seizure #2

- 14. For patients visibly pregnant or less than 2 weeks postpartum
 - a. Magnesium sulfate 4 gm **IV/IO** over 10 minutes
 - i. If IV/IO not available, magnesium sulfate 8 gm **IM** (4 gm in <u>each</u> buttock)
- 15. Contact OLMC for the following OPTIONS:
 - a. If repeated doses of midazolam necessary, unable to stop seizure activity, or if therapy beyond these protocols are necessary

PEARLS for Seizures:

- References for dosing of medications in seizures are in part from the article: *Silbergleit, et al. "Intramuscular versus Intravenous Therapy for Status Epilepticus", New England Journal of Medicine, Feb 16, 2012, Vol. 366, No. 7.
- Contact OLMC for any patient requiring 3 or more doses of midazolam independent of the route provided.
- For patients with Vagus Nerve Stimulator who are having repeated/continuous seizure activity, consider activation of the Vagus Nerve Stimulator, if not already attempted, by holding the patients hand-held magnet over the Vagus Nerve Stimulator.

P

Page 55 Gold 8

Adult Stroke #1

Stroke should be suspected if any of the following have appeared in the last few hours or days: weakness on one side of face, weakness in one arm or leg, abnormal speech (slurred, incoherent, absent).

Refer to the next page for early hospital notification process for patients who are potential stroke patients.

See Adult Coma protocol, **Gold 5**, if warranted.

See Adult Diabetic/Hyperglycemic Emergencies protocol, **Gold 6**, if warranted.

Northern New England Stroke Screening Tool				
Time Last Known Well: (if patient awoke with symptoms, last time k	nown to be at baseline)			
Witness Name and Best Contact Number:				
Prehospital Stroke Scale Examination	Please note: Normal	Abnormal		
Facial Droop: Have the patient smile and show teeth.	Normal	Abnormal		
Normal: Both sides of the face move equally well. Abnormal: One side of the face does not move as well as the other.				
Arm Drift: Have the patient close their eyes and hold arms extended.				
Normal: Both arms move the same, or both arms don't move at all.	Normal	Abnormal		
Abnormal: One arm doesn't move, or one arm drifts down compared to the other. Speech: Ask the patient to repeat a phrase such as "You can't teach an old dog new tricks". Normal: Patient says the words without slurring.				
Abnormal: Patient slurs words, says the wrong word, or is unable to	o speak. Normal	Abnormal		
Blood Glucose:				
YES NO Stroke Alert Criteria - Please chec				
Time from onset of symptoms is known to be less than 6 hours?				
Blood glucose is or has been corrected to greater than 60 mg/dL?				
Any abnormal finding on Prehospital Stroke Scale examination?				
Deficit unlikely due to head trauma or other identifiable cause?				
Stroke Alert Criteria - if YES to all criteria, contact receiving hospital and report a CODE STROKE.				

EMT

- 1. Manage airway as appropriate
- 2. Maintain O₂ saturation between 94 99%
- 3. Elevate head of stretcher to 30 degrees (unless patient requires spinal motion restriction)
- 4. Request ALS if available. Do not delay transport for ALS intercept
- 5. Perform finger stick to measure blood glucose, if so trained. If blood glucose is less than 60 mg/dL, refer to **Gold 6**

E

Adult Stroke #2

ADVANCED EMT/PARAMEDIC

- 6. Cardiac monitor
- 7. IV en route
- 8. Transport to the most appropriate facility based on regional resources
- 9. As early as possible, alert the receiving hospital of a "Code Stroke"
 - a. Relay the following information:
 - i. Patient age and gender
 - ii. Identify the patient as a potential stroke patient
 - iii. The patient's neurologic deficits and the findings of the Cincinnati Prehospital Stoke Scale
 - iv. The "Time Last Known Well"
 - v. The patient's mental status
 - vi. The patient's vital signs and finger stick blood glucose results
 - vii. ETA
- 10. Perform 12-lead ECG en route

PEARLS for Stroke:

- Consider transporting a **witness, family member or caregiver** with the patient to verify the time of stroke symptoms onset. If the witness can not come with you, obtain the witness' best phone number and relate to receiving hospital staff.
- **Time Last Known Well** is the last time the patient was noted to be neurologically normal. If the patient was sleeping and wakes up with symptoms, time least known well is the last time the patient was seen to be normal. Check if the patient had gotten up and been at baseline during the night.
- Suspect stroke in patients with any of the following new symptoms or complaints: acute visual disturbance, altered mental state, difficulty with balance or coordination, difficulty with speech or understanding, severe headache, weakness or numbness on one side. Stroke should be suspected whenever a person has a sudden change in neurological function. More common symptoms of stroke are weakness or loss of sensation of the face, a limb or a side of the face and body, abnormal speech production (slurred or inappropriate use of words) or comprehension, dizziness/vertigo, uncoordinated movements of a limb, gait disturbance, loss of vision in one eye or one side of vision and/or sudden onset severe headache for no obvious reason.
- Consider **stroke mimics** including: migraine, hypoglycemia, seizures, intoxication, sepsis.

This protocol was developed in collaboration with the Northern New England Protocol Group.

Gold 10

Acute Stroke #3 Stroke Checklist

Time of symptom onset/Time Last Known Well:		
Yes No	Has the patient had any recent trauma, surgeries or procedures in the last 3 months?	
	If Yes, what was the procedure and when did it occur?	
	Has the patient had any bleeding problems in the past? If Yes, what was the bleeding problem and when did it occur?	
	Is the patient taking any anticoagulants, including oral or injectable medications? If Yes, clarify what the medication is and when it was last administered.	

Please present these findings to the Emergency Medicine Staff at the receiving hospital. The patient's Last Known Well and the answers to these three questions identify the vast majority of ABSOLUTE contraindications for tPA. However, a positive answer to these questions does not absolutely rule out the ability to provide tPA.

PEARLS for Anticoagulants:

Patients may recognize their anticoagulants as "blood thinners". Inquire about traditional anticoagulants including warfarin (Coumadin or Jantoven) and Heparin (IV/IM) as well as novel anticoagulants, including dabigatran (Pradaxa), rivaroxaban (Xarelto), apixaban (Eliquis), betrixaban (Bevyxxa) or edoxaban (Savaysa). Please note, medication manufacturers are producing new anticoagulants frequently. Please note all medications the patient identifies as an anticoagulant and pass on to receiving hospital staff.

Medical Shock #1

See Cardiogenic Shock, **Red 17** if appropriate

See Hypovolemic Shock, **Green 12** if appropriate

See Allergy and Anaphylaxis, Gold 1 if appropriate

See Adult Airway Algorithm, Blue 3 if appropriate

See Pediatric Medical Shock, Pink

IDENTIFICATION OF POSSIBLE SEPSIS

- Suspected infection?
- Evidence of sepsis criteria? Includes **two or more** of the following:
 - Temperature less than 96.8 degrees F or greater than 101 degrees F
 - Heart rate greater than 90 bpm
 - Respiratory rate greater than 20 bpm
 - Systolic blood pressure less than 90 mmHg or Mean Arterial Pressure (MAP) less than 65 mmHg
 - New onset alerted mental status OR increasing mental status change with previous altered mental status.
 - Serum lactate (if available) greater than 2 mmol/L

EMT

- 1. Attempt to identify cause (i.e. allergic reaction)
- 2. Manage airway as appropriate
- 3. Request ALS intercept
- 4. Perform finger stick to measure blood glucose if so trained
 - a. If blood glucose less than 60 mg/dL, refer to Adult Diabetic/ Hypoglycemic Emergencies, **Gold 6**
- 5. Transport

ADVANCED EMT

- 5. Consider causes
 - a. Massive GI bleed, vaginal bleeding, vomiting, diarrhea, ruptured aneurysm -Treat per Hypovolemic Shock protocol, **Green 12**
 - b. Cardiogenic Shock protocol, Red 17
 - c. Anaphylaxis protocol, Gold 1
 - d. Severe Sepsis
 - i. Assess for acute pulmonary edema. If present, refer Cardiogenic Shock protocol, **Red 17**
 - ii. If available and trained perform point of care lactate:
 - A. If POC lactate > 4 and no evidence of pulmonary edema, administer 1000 mL NS bolus
 - iii. If POC lactate not available and no evidence of pulmonary edema, contact OLMC for OPTION of 500 mL NS bolus
 - iv. Notify receiving hospital that the patient is a "Code Sepsis"

E

Α

Medical Shock #2

PARAMEDIC

- 6. For medical or presumed septic shock
 - a. If no response to initial treatment:
 - i. Contact medical control to discuss additional fluid bolus versus initiating NOREPInephrine **IV infusion**. NOREPInephrine infusions in adults and pediatrics must be administered via a Maine EMS approved medication pump.
 - A. Preparation mix NOREPInephrine 8 mg in 250 mL NS.
 - B. Dosing -Starting dose is NOREPInephrine 0.03 mcg/kg/min. Titrate by 0.03 mcg/kg/min every 3-5 minutes. Usual dose is 0.03-0.25 mcg/kg/min. Usual max dose is 0.6 mcg/kg/min. Absolute max dose is 3 mcg/kg/min.
 - C. Titrate to maintain SBP greater than 90 mmHg
- 7. Additionally, if the patient is found to have Adrenal Insufficiency (via medic alert bracelet, patient records, or family/staff reports), administer dexamethasone as follows:
 - a. Adults dexamethasone 10 mg IV/IM, or IO x 1 dose
 - b. May provide patient's own dose of hydrocortisone (Solu-cortef) at the patient's physician's prescribed dose if patient provided medications are available

PEARLS for Sepsis:

P

- Sepsis is a systemic inflammatory response due to infection, often resulting in significant morbidity and mortality.
- Septic shock has a 50% mortality rate and must be treated aggressively.
- Treatment consisting of IV fluid administration and early antibiotic administration reduces mortality in septic patients.
- Please alert the receiving hospital with patients identified as septic.

This protocol was developed in collaboration with the Northern New England Protocol Group.

Page 60 Gold 13

Adult Abdominal Pain

Many diseases cause abdominal pain. While it is almost impossible to diagnose the cause of abdominal pain in the EMS environment, it is important to be prepared for the patient to suddenly become very ill. If the patient is in shock, refer to the medical shock protocol.

E

Α

EMT

- 1. Manage airway as appropriate
- 2. If evidence of shock, refer to the Medical Shock protocol, Gold 12

ADVANCED EMT

- 3. Establish IV
- 4. Perform 12-lead ECG (If so trained) under the following circumstances:
 - 1) The patient has a history of cardiac disease or risk factors for cardiac disease, or
 - 2) based on the provider's discretion

PARAMEDIC

- 5. Perform pain-rating score on 1-10 scale
- 6. For non-traumatic abdominal pain in a stable patient with a normal level of consciousness:
 - a. If appropriate, administer fentanyl 1 mcg/kg IV/IN for a maximum dose of 100 mcg
 - i. If repeated doses necessary, contact OLMC

P

Page 61 Gold 14

Nausea and Vomiting

Nausea and vomiting are symptoms of some other illness. Therefore, this is a supplemental protocol to be used in addition to other relevant protocols

E

Α

EMT

1. Transport in position of comfort

ADVANCED EMT

- 2. Perform 12-lead ECG (if so trained) under the following circumstances:
 - a. The patient has a history of cardiac disease or risk factors for cardiac disease, or
 - b. based on the provider's discretion
- 3. Establish IV Access
- 4. Consider fluid bolus if active vomiting

PARAMEDIC

- 5. Adults, administer ondansetron 4 mg IV or ondansetron 4 mg ODT tablet PO
 - a. May repeat once after 15 minutes as needed.
- 6. For Pediatric Patients, refer to Pediatric Nausea and Vomiting Protocol, Pink 2

Contact On-line Medical Control for dosage question, abnormal vital signs, or coincident drug use (including alcohol) by patient.

P

PEARLS for Management of Nausea and Vomiting:

A small percentage of patients receiving ondansetron experience adverse cardiac reactions including QT prolongation. For this reason, patients should be questioned about preexisting QT prolongation, which is a contraindication to receiving ondansetron. In these conditions, patients SHOULD NOT receive ondansteron.

Page 62 Gold 15

Minimum Landing Zone (LZ) Area #1

Aircraft Arrival

- Identify Scene and LZ Incident Command
- Establish radio communications prior to landing
- State Fire or State EMS are the default radio frequencies
- Advise pilot of terrain conditions, vertical obstructions, and wind direction
- Secure LZ and identify personnel to guard tail rotor guards
- Notify pilot if patient is packaged and ready for hot load.

Operating Around Helicopter

- Approach aircraft with crew escort only
- Approach aircraft 90 degrees to door only
- Avoid tail boom and rotor at all times
- Eye and ear protection should be worn
- Do not carry anything above shoulder height
- Secure all loose medical and personnel equipment
- Spotlights, headlights, and/or hand-held lights should not be pointed directly at the helicopter.

Page 63 Green 1

Minimum Landing Zone (LZ) Area #2

<u>Terrain:</u>

- Flat, firm, free of debris
- Consider dust and snow
- LZ should be downwind of accident scene
- Free of vehicles and people
- Any markers must be able to withstand 60 mph winds
- Approach path only from down slope of aircraft

Vertical Obstructions:

- Mark towers, antennas, poles, tall trees with vehicle
- Check the wind, helicopter must land and take off into the wind
- Ideal = clear approach and departure angle 8:1 (200' to 25' vertical obstruction)

Wires:

- Electrical and utility wires are greatest single hazard to helicopters
- Search LZ area for wires
- Mark all wires, high-tension lines, guide wires with vehicles
- Notify pilot of all wires in proximity to landing zone

Lighting:

- Never shine light directly at aircraft
- All emergency lights on until aircraft overhead
- Shut down vehicle strobes and white lights when aircraft on approach
- Keep working lights on minimum

<u> Aircraft Departure</u>

- Keep LZ clear for at least 5 minutes after helicopter departure
- In case of emergency the helicopter may have to return to LZ
- Keep communications open with pilot

REMEMBER - EVERYONE IS RESPONSIBLE FOR SAFETY

Page 64 Green 2

Trauma Triage #1 (Patient with Blunt or Penetrating Trauma)

ASSESSMENT #1 ASSESS PHYSIOLOGIC COMPROMISE

Determine: Glasgow Coma Scale Respiratory Rate

Systolic Blood Pressure

GCS ≤ 13

Systolic Blood Pressure < 90 mmHg
Respiratory Rate < 10 or > 29 breaths per minute
(< 20 in infant aged under 1 year old) or need for ventilator support

No

ASSESSMENT #2: ASSESS ANATOMIC INJURY

DO ANY OF THE FOLLOWING CONDITIONS EXIST?

- Penetrating injury to head, neck, torso and extremities (proximal to the elbow)
- Chest wall instability or deformity (i.e. flail chest)
- Two or more proximal long bone fractures
- Crushed, de-gloved, mangled or pulseless extremity
- Amputation proximal to the wrist or ankle
- Pelvic fractures
- Open or depressed skull fractures
- Paralysis

Go to nearest Regional Trauma Center (CMMC, EMMC, MMC) if total transport time is less than 45 minutes, otherwise go to closest ED which is a trauma system participating hospital; any questions, then contact OLMC

-Yes

Page 65 Green 3

Trauma Triage #2 (Patient with Blunt or Penetrating Trauma)

ASSESSMENT #3 ASSESS MECHANISM OF INJURY AND EVIDENCE OF HIGH ENERGY

IMPACT

- 1. Falls
 - a. Adults: > 20 feet (one story is equal to 10 feet)
 - b. Children: > 10 feet or 2-3 times the height of the child
- 2. High Risk Auto Crash
 - a. Intrusion, including roof: > 12 inches occupant compartment, > 18 inches any compartment
 - b. Death in same passenger compartment
 - c. Ejection (partial or complete) from the automobile
 - d. Vehicle telemetry data consistent with high risk injury
- 3. Auto vs. pedestrian/bicyclist thrown, run over, or with significant (>20 mph) impact
- 4. Pedestrian thrown or run over by vehicle

Ν̈́o

ASSESSMENT #4 ASSESS SPECIAL PATIENT OR SYSTEM CONSIDERATIONS

Older Adults

- Risk of injury/death increases after age 55 years
- SBP < 110 might represent shock after age 65 years
- Low impact mechanisms (i.e. ground level falls) might result in severe injury

Children

• Should be triaged preferentially to a pediatric capable trauma center

Anticoagulant and bleeding disorders

 Patients with head injury are at high risk for rapid deterioration

Burns

- Without other trauma mechanism: triage to burn facility
- With trauma mechanism: triage to trauma center

Pregnancy > 20 weeks EMS Provider Judgment

No

Transport to Trauma System Participating Hospital Yes

Consider transport to nearest Regional Trauma Center (CMMC, EMMC, MMC) if total transport time is less than 45 minutes vs. transport to the closest ED, which is a trauma system participating hospital; any questions, then contact OLMC

-Yes-

Page 66 Green 4

Trauma Triage #3 (Patient with Blunt or Penetrating Trauma)

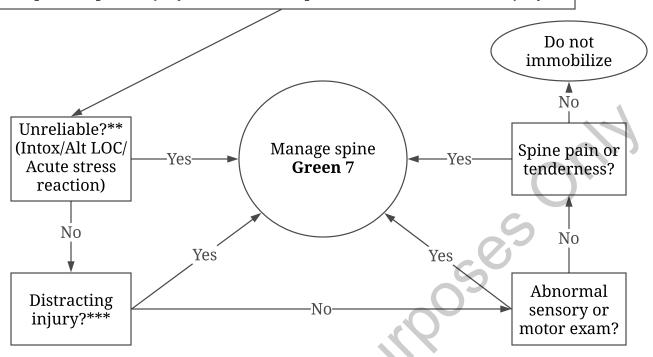

- 1. OLMC considers patient transport to Regional Trauma Center (RTC) using the following guidelines:
 - a. If patient would best be served by RTC and transport time less than 45 minutes, then OLMC may direct you to the RTC
 - b. If patient requires RTC but transport time greater than 45 minutes or patient requires life saving interventions, patient to go to the closest ED
- 2. If upon arrival in ED:
 - a. Facility is not a RTC and
 - b. Patient continues to satisfy criteria of Assessments #1 and #2, and
 - c. Patient can be stabilized for further transport, then the sending ED clinician should follow the regional/state trauma plan

If prehospital providers are unable to definitively manage the airway, maintain breathing or support circulation, begin transport to most accessible hospital and simultaneously request ALS intercept or tiered response.

Page 67 Green 5

Spine Assessment

Suspected spinal injury - Based on complaint and mechanism of injury*

- * High risk mechanisms of injury in the pediatric population include, but are not limited to, the following: motor vehicle collisions, recreational vehicles (all-terrain vehicles and snowmobiles), axial loading, substantial torso injuries, and falls greater than 10 feet.
- ** Clearance of the spine requires the patient to be calm, cooperative, sober, and alert. Note that the smell of alcohol on the breath is not necessarily the same thing as intoxication; a single beer can be detected on the breath, but does not necessarily cause significant intoxication. The real question is not about the presence or absence of any alcohol, etc.; it is whether or not the patient and the exam are reliable.
- *** Distracting injury includes any injury that produces clinically apparent pain that might distract the patient from the pain of a spine injury. The real question is not about the presence or absence of any other injuries, it is whether or not the patient and the exam are reliable.

Remember that patients can fracture the spine at any level, not just the C-spine. If a fracture at another level of the spine is suspected, the *entire* spine must be immobilized, including the cervical spine. Patients with thoracic or lumbar fractures will commonly have associated cervical spine injuries.

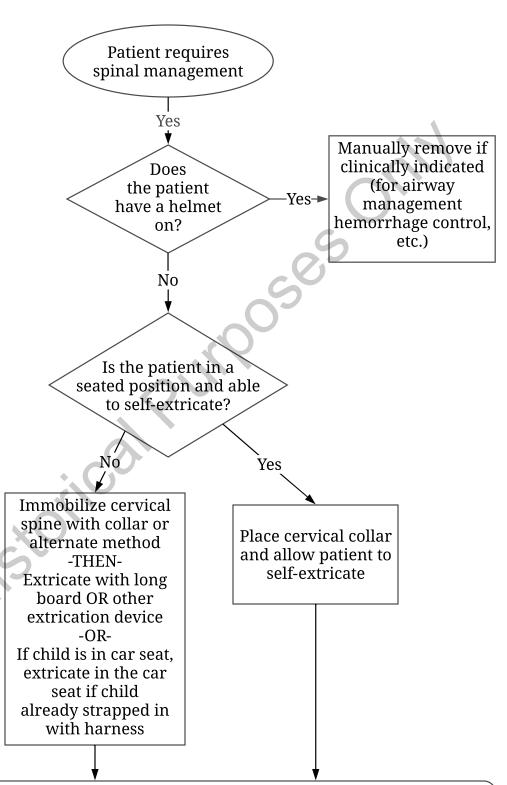

Page 68 Green 6

Spine Management #1

- * Patients are able to self-extricate from a motor vehicle or seated position to an EMS litter when **all** of the following conditions are met:
- 1. Able to reliably follow commands including instructions to maintain neutral spine position
- 2. Without injury that would preclude patient from ambulating
- 3. The patient ambulates as little as possible. Ultimately the EMS litter should be in close proximity to the patient

Patients in the lying position should be moved to the EMS litter by scoop/long board or other similar device.

Only patients in a seated position (i.e. a vehicle) are candidates for self-extrication. Proper methods of self-extrication limit patient movement as much as possible. For instance, patient movement should be limited to standing and pivoting to the litter. Please use caution when considering self-extrication and recognize that some vehicles are difficult to self-extricate from. Use judgment when considering self-extrication, recalling the goal of minimizing spine movement. If, in your judgment, self-extrication would lead to more spine motion than an alternate method of extrication, proceed with the alternate method.

Once patient is on the EMS litter, remove the long board UNLESS safe transport requires the use of a long board (see PEARLS). Transfer patient to appropriate hospital based on trauma triage decisions. If patient is in a car seat, appropriately secure car seat to the stretcher or captains's seat.

Page 69 Green 7

Spine Management #2

PEARLS for Spine Management

Role of Backboards - While the MDPB is attempting to limit the use of backboards, prehospital and hospital providers should recognize there remain circumstances in which use of a backboard is appropriate. Backboards should be utilized to extricate patients from vehicles or other situations when they are unable to extricate themselves (critical patients, patients with lower extremity injuries, severe head injuries, etc.). In most instances, once on the EMS litter, the backboard is redundant and can be removed. However, in some settings, it may be appropriate for the backboard to remain. Those settings include, but are not limited to the following:

- 1. Cases in which the backboard is being utilized as an element of the splinting strategy (such as multiple long bone fractures)
- 2. Cases in which the patient is at risk for vomiting but unable to protect their own airway (such as intoxication, head injury, etc.) and may need to be turned to the side for airway protection during transport.

 3. Cases in which the patient is unresponsive or agitated (i.e. head injury)
- 4. Cases in which removal of the backboard would otherwise delay transport to definitive care in a critical patient

Preferred Position - The preferred position for all patients with spine management is flat and supine. There are two circumstances under which raising the head of the bed should be considered:

- a. Patients in respiratory distress. Populations at risk for developing respiratory distress when laying flat include the elderly with underlying lung disease, patients with morbid obesity and late term pregnant patients
- b. Patient with suspected severe head trauma

Under these circumstances, consider raising the head of the bed to no more than 30 degrees

Inter-Facility Transport - Long backboards do not have a role in the transport of patients between hospitals EVEN IF SPINE INJURY IS DIAGNOSED. Use of long boards during inter-facility transport is associated with increased pain and potential for pressure sores and ulcers. Patients should instead be managed with cervical collar (if appropriate) and firmly secured to the EMS stretcher. If a sending facility has placed the patient on a long board or requests use of a long board, EMS providers should discuss the option of foregoing backboard use with the sending physician. If a back board is used, it must be padded adequately to maximize patient comfort.

Penetrating Injury - The incidence of incomplete, unstable spine injury in penetrating trauma is low. Spine immobilization on a backboard is associated with an increased risk of death in patients with penetrating injuries to the neck, especially gun shot wounds, due to unrecognized hemorrhage and airway compromise. Spine immobilization does not appear to prevent progression of neurologic injury in cases of penetrating cervical trauma and may negatively affect patients with vascular and airway injuries. Penetrating trauma such as a gunshot wound or stab wound should not be immobilized on a long board and should instead be secured firmly to the EMS litter. Emphasis should be on airway and breathing management, treatment of shock, and rapid transport to a Level 1 or 2 Trauma Center.

Special Patient Populations

- Caution should be exercised in older patients (i.e. 65 years and older) and in very young patients (i.e. less than 3 years of age), as spinal assessment may be less sensitive in discerning spinal fractures in these populations. However, age alone should not be a factor in decision-making for prehospital spinal care, yet the patient's ability to reliably provide a history should be considered.
- In children using a booster seat or lap/shoulder belt during a motor vehicle collision, consider allowing the patient to self-extricate him/herself after applying a cervical collar, if needed. For the infant or toddler who is already strapped in a car seat with a built-in harness, extricate the child while strapped in his/her car seat.
- Children who do not require spinal immobilization or lying flat may be safely transported when restrained in an age-appropriate car seat secured to the stretcher. Children who do require spinal immobilization or lying flat should be directly secured to the stretcher.

Helmet Use - Padding should be applied, if necessary, to maintain neutral cervical spine positioning depending on the type of sports and presence or absence of shoulder pads.

Management - In patients who have suffered a potential spinal injury and need to be moved onto or off of a backboard, consider using the lift and slide technique rather than the log roll technique, when feasible.

Page 70 Green 8

Glasgow Coma Scale

Adult	Pediatric	Score
Eye Opening Response	Same as Adult	
Open spontaneously		4
Open to voice command		3
Open to painful stimuli		2
Eyes remain closed		1
Best Motor Response	Same as Adult	
Moves on command	25	6
Pushes painful stimuli away	S	5
Withdraws from painful stimuli	203	4
Decorticate (flexion)		3
Decerebrate (extension)		2
No motor response to pain		1
Best Verbal Response	2	
Oriented	Appropriate words or social smile, fixes and follows	5
Confused	Cries but consolable	4
Inappropriate words	Persistently irritable	3
Incomprehensible sounds	Restless, agitated	2
No sounds	None	1

Page 71 Green 9

Chest Trauma

EMT

E

Α

- 1. O₂ as appropriate
- 2. Assist ventilations (PPV) if needed
- 3. Request ALS if available
- 4. Impaled Objects
 - a. Secure in place with bulky dressings
- 5. Open Chest wound
 - a. Cover with thick, bulky dressing (i.e. abd pad or bulky trauma dressing) and secure in place
 - i. Monitor for persistent air leak and add additional dressings or consider occlusive dressing as one way valve if needed
- 6. Flail segment with paradoxical movement and respiratory distress
 - a. Consider PPV

ADVANCED EMT

- 7. IV en route
- 8. If shock present, perform fluid bolus
- 9. Cardiac monitor and consider ECG
- 10. Request Paramedic if available

PARAMEDIC

12. For presumed tension pneumothorax, perform chest decompression

NOTE: Chest decompression will be performed on the involved side using a Maine EMS approved device at the second or third intercostal space on the mid-clavicular line, or fifth or sixth space on the anterior-axillary line.

P

Page 72 Green 10

Hemorrhage

EMT

- 1. Ascertain all sites of bleeding and control with pressure
- 2. If life-threatening bleeding is on extremity and uncontrolled with pressure, consider applying a Maine EMS Approved tourniquet
 - a. Tourniquets should be applied proximally on the affected limb for the following reasons:
 - i. Injuries are commonly more proximal than anticipated, and
 - ii. Double bone structures lower in both the forearm and the leg effectively splint the arteries and prevent tourniquets from working properly
 - b. Tourniquets should be as tight as possible
 - i. Due to associated pain, request ALS if available
 - c. If hemorrhage continues after application of the tourniquet, ensure the tourniquet is applied as tightly as possible. If hemorrhage continues, consider placement of a second tourniquet, proximal to the first. Experience has shown applying two tourniquets greatly reduces the incidence of hemorrhage, especially in injuries to the lower extremity
- 3. If life-threatening bleeding is not controlled by the above or is located in an area not amenable to placement of a tourniquet, consider applying a Maine EMS approved hemostatic agent by packing the agent in the wound and applying/maintaining pressure over the agent for a minimum of 5 minutes. Check for ongoing bleeding. If bleeding has stopped, bandage appropriately, if bleeding continues, reapply pressure for a minimum of 5 minutes. If bleeding continues after the second period of pressure, remove the initial hemostatic agent and repeat with a new hemostatic agent. Remember, for these agents to have maximal effectiveness, they must be packed inside the wound as close to the bleeding tissue as possible
- 4. Treat for shock if indicated and manage airway as appropriate
- 5. If amputation, rinse severed part briefly and gently with sterile saline to remove debris
 - a. Wrap severed part in sterile saline gauze, moisten with sterile saline (do not soak), place in a water- tight container. Place container on ice (do not use dry ice). Do not put part directly on ice. If necessary, use ice packs to provide some level of cooling
- 6. Request Paramedic if bleeding cannot be controlled, patient demonstrates signs or symptoms of shock, or the patient requires pain management due to tourniquet placement

ADVANCED EMT /PARAMEDIC

- 7. IV en route (refer Hypovolemic Shock protocol, **Green 13**).
- 8. Cardiac monitor

A P

E

Page 73 Green 11

Head Trauma

EMT

E

- 1. Consider immobilizing the spine
- 2. O₂ as appropriate. If necessary, airway management as per Airway Management Protocols **Blue 3** or **Blue 5**
- 3. If necessary to support ventilation, provide PPV at 10-12 breaths per minute
 ** It is important to neither hypoventilate or hyperventilate these patients**
- 4. If not in shock, elevate head of bed to 30 degrees while maintaining spinal immobilization
- 5. Treat for shock if indicated
- 6. Request ALS if available and patient has altered mental status or abnormal vital signs

ADVANCED EMT / PARAMEDIC

- 7. IV en route
- 8. If shock present, perform fluid bolus to maintain BP greater than 90 mmHg
- 9. Cardiac monitor
- 10. Manage seizures as per Adult Seizures protocol, **Gold** 7 or Pediatric Seizure protocol, **Pink 6**

A P

Page 74 Green 12

Hypovolemic Shock #1

If history of illness or mechanism of injury consistent with signs/symptoms of shock (elevated pulse, elevated respiratory rate, cool/pale skin, altered LOC, anxiety, sweating or lowered BP) then transport as soon and as efficiently as possible.

If the cause of the shock is:

Anaphylaxis, Anaphylaxis protocol, **Gold 1** Cardiogenic, Cardiogenic Shock protocol, **Red 17** Tension Pneumothorax, see Chest Trauma protocol, **Green 10** Medical Shock, see Medical Shock protocol, **Gold 12**

E

EMT

- 1. Control bleeding refer to Hemorrhage protocol, Green 11
- 2. Manage airway as appropriate refer to Blue 3 or Blue 5
- 3. If patient in third trimester of pregnancy:
 - a. Place patient on left lateral recumbent side and re-evaluate
 - b. If shock is secondary to trauma, immobilize patient on a spinal board before placing in left lateral recumbent position (manually displace uterus to the left if tilting the board not possible)
- 4. Request ALS

ADVANCED EMT

- 5. IV en route
- 6. Cardiac monitor
- 7. If shock present (see below table), perform fluid bolus according to the following guidelines:
 - a. Pediatrics establish IV access and perform 20 mL/kg fluid bolus. Repeat, as needed, within 15-30 min
 - b. Uncontrolled bleeding: for suspected internal bleeding or uncontrolled bleeding, fluid bolus to maintain target systolic BP of 90 mmHg
 - c. Suspected TBI/CNS injury: fluid bolus to maintain BP greater than 90 mmHg
- 8. Contact OLMC if patient is older than 65 years of age for fluid bolus order

PARAMEDIC

- 9. The paramedic may perform all above treatment without medical control
- 10. Contact OLMC if blood pressure remains less than 90 systolic after boluses of normal saline
- 11. In patients with penetrating or blunt injury and:
 - are greater or equal to than 16 years of age, and
 - are hemodynamically unstable as evidenced by tachycardia, hypotension or other evidence of shock, and
 - who are less than 180 minutes (3 hours) from time of injury, consider:
 - a. Tranexamic acid (TXA) 1 gm IV mixed in 250 mL of NS over 10 minutes.
 - i. **CONTRAINDICATIONS** listed on **next page**

Discuss use of TXA in patients on anticoagulation with OLMC before providing medication.

A

Page 75

Hypovolemic Shock #2

Tranexamic acid (TXA) is contraindicated in

- Isolated head injuries,
- Patients greater than 24 weeks pregnant (or pregnant with fundus above umbilicus),
- Patients with known hypercoagulable states,
- The patient is more than 180 minutes (3 hours) from the time of injury.

PEARLS for the use of TXA:

Tranexamic acid is a lysine analogue that competitively binds to plasminogen therefore interrupting interactions with fibrin and preventing fibrinolysis or clot break down. Patients in hemorrhagic shock from either blunt or penetrating trauma may benefit from Tranexamic acid (TXA). TXA must be provided as soon as possible, preferably within 1 hour of injury and absolutely before 3 hours from injury.

Please ensure that receiving hospital staff:

- 1. Know the time of injury,
- 2. Are aware that the patient received TXA,
- 3. Are aware of the 1 gram dose as the patient may need to be re-dosed upon arrival, and
- 4. **Flag the IV line** that the patient received TXA through with a labeled piece of tape as some medications and blood products should not be provided through the same line.

Additionally, discuss the use of TXA in patients on anticoagulants as these patients may require anticoagulation reversal and the combination of TXA and some of the reversal agents may have additive thrombotic effects. There are few adverse effects of this medication. TXA may cause hypotension if provided rapidly. The full dose should be provided over 10 minutes to prevent hypotension.

If the cause of hypovolemic shock is felt to be secondary to acute unstable pelvic fracture, the EMT, AEMT, or Paramedic may consider using a Maine EMS approved pelvic stabilization device. If Maine EMS approved pelvic binder is not available, consider immobilization with a sheet wrap.

Classification of Hemorrhagic Shock				
	Compensated	Mild Shock	Moderate Shock	Severe Shock
Blood Loss	<15% (1000 mL)	15-30% (1000-1500 mL)	30-40% (1500-2000 mL)	>40% (>2000mL)
Pulse	Normal	Elevated (>100)	Elevated (>120)	Elevated (>140)
Blood Pressure	Normal	Orthostatic Change	Marked Fall	Profound Fall
Cap Refill	Normal	May be Delayed	Usually Delayed	Always Delayed
Respiration	Normal	Mild Increase	Moderate Tachypnea	Marked Tachypnea and Respiratory Collapse
Mental Status	Normal or Agitated	Agitated	Confused	Lethargic/ Obtunded

Page 76 Green 14

Burn #1

EMT

E

A

- 1. Remove burned clothing and/or jewelry unless adhered to patient
- 2. O_2 as appropriate
- 3. Give highest priority to airway problems and major trauma
- 4. Manage shock if present
- 5. If burn area is less than 10% of Body Surface Area (BSA), cover with dressing soaked in normal saline or other commercially prepared moist burn dressing
- 6. If burn area is greater than 10% BSA, cover with dry dressing, sterile sheet, or commercially prepared dry dressing
- 7. Request ALS where there is a possibility of respiratory compromise, shock, burns greater than 10% BSA or need for pain medication

ADVANCED EMT

- 8. Venous access en-route (avoid placing IV/IO in burned skin if possible)
- 9. Cardiac Monitor (avoid placing leads on burned skin)
- 10. If shock present, perform fluid bolus
- 11. If shock NOT present, deliver normal saline as follows
 - a. 0.25 x wt (kg) x % BSA = mL/hr (this represents the patient's fluid requirement each hour for the first 8 hours after the burn)

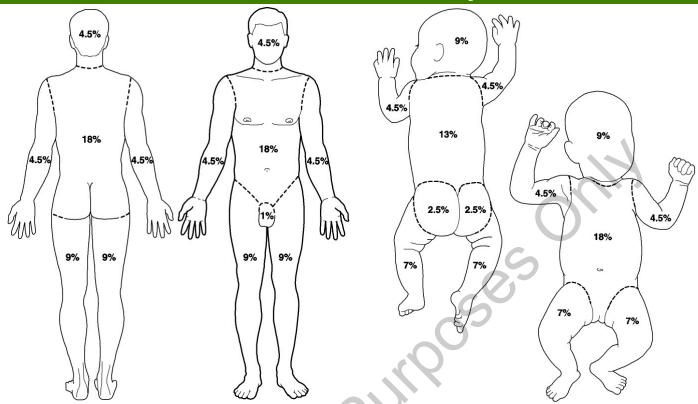

PARAMEDIC

12. For pain control, refer to the Universal Pain Management protocol, **Green 17** or Pediatric Universal Pain Management protocol, **Pink 3**

P

Page 77 Green 15

Burn #2 Rule of 9's Estimation of Burned Body Surface (Percent)

Remember: The patient's palm (hand minus fingers) is about 1% of the patient's body surface area.

Page 78 Green 16

Universal Pain Management #1

For pediatric pain scales go to pink 3 & 4 Patient Inclusion Criteria

Patients who are experiencing pain either from a traumatic injury or with non-traumatic chest, abdominal, or flank pain. Contact medical control for any other painful conditions including but not limited to back pain, headache, and non-traumatic extremity pain.

Patient Exclusion Criteria

Change in baseline mental status, head injury with change in mental status from baseline. See number 9 for treatment options
For suspected cardiac chest pain, refer to **Red 2**

EMT

- 1. Verbal reassurance
- 2. Splinting as needed, provide in-line stabilization. Consider ice application in isolated extremity trauma if hypothermia/frostbite is not an issue
- 3. Evaluate pain using age appropriate pain scale
- 4. Request ALS for pain management

ADVANCED EMT

- 5. Consider IV access in preparation for ALS pain management
- 6. Consider cardiac monitoring based on patient assessment
- 7. If pain not improved and no contraindications to oral medications exist, con OLMC for option of Acetaminophen chewable tab, 10 mg/kg rounded to the nearest 80 mg.

PARAMEDIC

- 8. Paramedics may perform all above treatment without medical control
- 9. For stable patients suffering pain from trauma or other listed inclusion criteria, consider the use of fentanyl 1 mcg/ kg **IV/IM/IN** with an initial maximum dose of 100 mcg.
 - For persistent traumatic pain, may repeat doses every 5-10 minutes at 0.5-1 mcg/kg (MAX dose 100 mcg) IV/IM/IN titrated to effect, with a cumulative maximum dose of 5 mcg/kg
 - ii. For non-traumatic pain, contact on-line medical control if additional dosing necessary.
 - a. Alternative pain control: 50% nitrous oxide/oxygen mixture self administered (i.e. Nitronox). (Contraindicated in suspected pneumothorax)
 - i. NOTE: Patients should NOT receive opioids AND Nitronox together for pain control due to additive adverse affects with administration of combined medications

(Continued)

E

P

- c. For pain not controlled with fentanyl or for patients with a fentanyl allergy, contact OLMC for the following options:
 - i. Ketamine 0.2 mg / kg **IV** to a max dose of 25 mg
 - 1. Repeat every 15 minutes as needed for pain to a cumulative maximum dose of 1 mg/kg
 - ii. Ketamine 0.5 mg/kg IN to a max dose of 25 mg
 - 1. Repeat 0.25 mg/kg IN in 15 minutes as needed for pain x 1
- d. Contact OLMC if further dosing needed or vital signs are not stable. For dosage questions, abnormal vital signs, coincident drug use (including alcohol) by patient, or if IV cannot be established, contact OLMC before administering pain medication.
- e. For nausea or vomiting, administer ondansetron 4 mg **IV** or ondansetron 4 mg ODT **PO** and may repeat once after 15 minutes if needed. For dosage question (for pediatric dosing, refer to Pediatric Universal Pain Control protocol, **Pink 3**), abnormal vital signs, coincident drug use (including alcohol) by patient, contact OLMC before administering medication

Special Circumstances

- 9. Contact OLMC before using any narcotic, antiemetic, or anxiolytic for isolated trauma involving head, any patient with mental status changes or in patients with unstable vital signs (including Systolic BP less than 100 mmHg). Use narcotics, antiemetics, and anxiolytics with caution in those with hypotension, bradypnea, or if coincident drug use (including alcohol) by patient.
 - a. Consider the use of fentanyl 1 mcg/kg **IV/IM/IN** initially with an initial maximum dose of 100 mcgs, then 25-75 mcgs **IV/IM/IN** every 5-10 minutes titrated to effect with cumulative maximum dose of 5 mcg/kg
 - b. For nausea or vomiting, administer ondansetron 4 mg **IV** and may repeat once after 15 minutes if needed
 - c. Consider self-administered fixed dose of 50% nitrous oxide/oxygen mixture delivered by commercially available device (such as Nitronox).
 (Contraindicated in suspected pneumothorax)
 - i. Note: Patients should NOT receive opioids AND Nitronox together for pain control due to additive adverse affects with administration of combined medications
- 10. Transport in position of comfort and reassess pain as indicated

PEARLS for Pain Management:

Acute pain management is often considered to be a "ladder" process; that is, start at the bottom rung and increase the "strength" AND risk of interventions in a stepwise fashion similar to climbing the rungs of a ladder. Therefore, it is expected that all providers regardless of license level will manage patients in the stepwise fashion to the maximum scope of practice of their licenses.

P

Termination of Resuscitation For Traumatic Cardiac Arrest (Adult and Pediatric)

Exclusion Criteria: (Patients for whom this protocol does not apply):
Hypothermic Patients, refer to Hypothermia protocol, Yellow 8
Drowning patients, refer to Drowning protocol, Yellow 17
Patients whose presentation is consistent with a medical cause of cardiac arrest, refer to Cardiac Arrest protocol, Red 8

Inclusion Criteria: Cardiac arrest from blunt or penetrating trauma in adult and pediatric patients.

EMT/ADVANCED EMT/ PARAMEDIC

- 1. Do not initiate cardiac arrest resuscitation if any of the following exist:
 - a. Injuries incompatible with life
 - b. Evidence of significant time lapse since pulselessness
 - i. Dependant lividity, rigor mortis, or decomposition
- 2. Do not initiate resuscitation in blunt trauma patients who are apneic and pulseless
- 3. Do not initiate resuscitation in penetrating trauma patients who are pulseless and apneic
 - a. CONSIDER resuscitation and transport ONLY if, transporting in a safe and prudent manner, you can deliver the patient to a hospital within 15 minutes of the TIME OF ARREST

PARAMEDIC

- 4. If resuscitation initiated, consider the following:
 - a. Bilateral needle decompression of the chest to alleviate tension pneumothorax (Chest Trauma protocol, **Green 10**)
 - b. Fluid bolus

P

E A

Page 81 Green 19

Toxins #1

Call Poison Control (1-800-222-1222) to receive medical guidance on patient care and to ensure information on the toxin can be sent to the receiving ED prior to patient arrival.

This protocol refers to toxins that are:

- Ingested
- Inhaled
- Absorbed
- Injected (envenomation)

This protocol refers to toxins that cause:

- Systemic effects
- Local effects
- Both systemic and local effects

I. GENERAL ASSESSMENT

What: Identify specific toxin and amount of exposure. If possible, bring pill bottles, MSDS sheets, placard info, shipping manifest, etc.

When: Identify time of exposure **Why:** Identify reason for exposure

In many cases, all vital information obtainable from the scene is available ONLY to EMS providers. This is essential information to pass on to downstream providers.

II. INITIAL ASSESSMENT

- 1. Scene Safety: protect rescuers and patients from immediate danger and contamination. Toxic exposures might require special precautions, including HAZMAT precautions, before patient treatment begins
- 2. O₂ as appropriate
- 3. Manage airway as necessary, refer to Blue 3 and Blue 5
- 4. Consider local measures for treatment
- 5. Request ALS

ADVANCED EMT/PARAMEDIC

6. If patient is hypotensive, initiate IV en route and perform fluid bolus

A P

E

Page 82 Yellow 1

Toxins #2

III. SPECIFIC TREATMENTS TO REMOVE AND DILUTE TOXINS

Initiate measures to remove and dilute toxin

For INGESTED Toxins

E

EMT

- 1. O₂ as appropriate
- 2. Manage airway as necessary per Blue 3 or Blue 5
- 3. Consider local measures for treatment

A

ADVANCED EMT

4. If patient is hypotensive - IV en route - perform fluid bolus

PARAMEDIC

- 5. The role of charcoal in EMS is of limited value and should be provided ONLY under OLMC guidance. Contact OLMC to consider:
 - a. Activated charcoal without sorbitol 1 g/kg PO
 - b. Do not provide charcoal under the following circumstances:
 - i. Ingestion of caustic substance
 - ii. Hydrocarbons
 - iii.Seizures
 - iv. Patient is unable to swallow/protect airway

P

Page 83 Yellow 2

Toxins #3

For INHALED Toxins **EMT/Advanced EMT/Paramedic** 1. Remove the patient from exposure site 2. Deliver 100% oxygen if possible 3. Manage airway as necessary per Blue 3 or Blue 5 For Absorbed Toxins **EMT / ADVANCED EMT** E Α 1. Brush off all solid material 2. Flush skin vigorously and continuously with water 3. Flush eyes continuously with water, saline, or Lactated Ringers **PARAMEDIC** 4. Consider pain medication, refer to Adult Universal Pain Management protocol, Green 17, Pediatric Universal Pain Management protocol, Pink 3, or analgesic for eye pain see Ophthalmology protocol, Yellow 11 For INJECTED Toxins There is no effective method of removing/diluting toxins that have already been injected through. Avoid further exposure to injected toxins. E A P

Page 84 Yellow 3

Antidotes for Specific Toxins: Tricyclic Antidepressants

Some examples of tricyclic antidepressants include: amitriptyline, desipramine, doxepin, imipramine, nortriptyline, **notify OLMC**

E

EMT

- 1. O₂ as appropriate
- 2. Manage airway as needed, refer to **Blue 3 or Blue 5**
- 3. Request ALS

A

ADVANCED EMT

4. Perform fluid bolus if hypotensive

PARAMEDIC

In patients with known tricyclic overdose, and either hemodynamic instability or widened QRS complex:

P

- 5. Administer sodium bicarbonate 1 mEq/kg **IV**. May repeat as needed with goal of QRS Complex less than 120 msec
- 6. Contact OLMC if further direction needed for conditions such as arrhythmia

PEARLS for Tricyclic Antidepressant Toxicity:

Sodium bicarbonate increases extracellular sodium, thereby overcoming sodium channel blockade of the tricyclic antidepressant. This effect is transient and may be difficult to notice at first. Some patients may need repeated doses of sodium bicarbonate to fully correct QRS duration.

Page 85 Yellow 4

Antidotes for Specific Toxins: Opiates

NEVER GIVE NALOXONE TO A NEONATE

EMT

E

- 1. Administer O₂ as appropriate
- 2. Manage airway as needed refer to Blue 3 or Blue 5
- 3. Request ALS if available
- 4. If respirations less than 12/minute AND narcotic overdose suspected:
 - a. Adults and Pediatric patients: naloxone 0.5 mg **IN**. Titrate to effect by providing 0.5 mg in one nostril. The beneficial outcome is effective oxygenation and ventilation with one important parameter being a respiratory rate of greater than 12 breaths/minute. Continue to manage the airway while assessing for effect. If the patient remains apneic or continues to have ineffective oxygenation and ventilation in 2-5 minutes after provision of the first dose of naloxone, provide a second dose of naloxone 0.5 mg in the other nostril. Repeat 0.5 mg of naloxone every 2-5 minutes in alternating nostrils.
 - b. NOTE: Patients abruptly and fully awakened from narcotic overdose may become combative or suffer acute narcotic withdrawal symptoms. Some drugs such as prolonged release opioids, buprenorphine or methadone may require doses greater than 4 mg.

ADVANCED EMT/PARAMEDIC

- 5. Establish IV access as needed
- 6. Alternate naloxone route of administration
 - a. Naloxone 0.1 2 mg IV/IO/IM; titrate to improved respiratory drive
 - b. In Pediatric Patients: naloxone less than 20 kg: 0.1 mg/kg. If greater than 20 kg or 5 years old or greater, 0.1 2 mg IV/IO/IM; titrate to to improved respiratory drive
 - c. NOTE: Patients abruptly and fully awakened from narcotic overdose may become combative or suffer acute narcotic withdrawal symptoms. Some drugs such as prolonged release opioids, buprenorphine or methadone may require doses greater than 4 mg.
 - d. Cardiac monitor

A P

PEARLS for Management of Opioid Overdose:

- * Recall, the patient suffering from opiate overdose requires immediate oxygenation and ventilation. This should be the priority for these patients and is accomplished by airway management. Naloxone may be applied, but only after initiation of airway management practices.
- * Naloxone should be titrated to adequate respiratory drive and airway protection rather than a completely awakened state.

Page 86 Yellow 5

Antidotes for Specific Toxins: Organophosphate/Carbamate

PEARLS for Organophosphate Poisoning:

WARNING: CONTACT WITH THESE TOXINS CAN BE FATAL TO RESCUERS. CONSIDER SCENE SAFETY AND DECONTAMINATION

- Assess for SLUDGEM (Salivation, Lacrimation, Urination, Defecation, GI Distress, Emesis, Muscle Twitching/Miosis[constricted pupils]) and the Killer-Bs (Bradycardia, Bronchorrhea, Bronchospasm)
- If you suspect a bioterrorism/WMD threat, see Gray 21

In unstable patients with known organophosphate/carbamate poisoning: **EMT**

- 1. O₂ as appropriate
- 2. Manage airway as appropriate. Ventilatory support can be critical in these poisonings, refer to **Blue 3 or Blue 5**
- 3. Vigorous suctioning may be necessary
- 4. Request ALS

ADVANCED EMT

- 5. IV en route
- 6. Cardiac monitor

PARAMEDIC

- 7. If apnea/seizures/unconsciousness/flaccid paralysis:
 - a. Adult: 3 Atropine auto-injectors **IM** or atropine 6 mg **IM**
- 8. If dyspnea/twitching/nausea/vomiting/sweating/confusion/constricted pupils
 - a. Adult: 1 atropine auto-injector IM or atropine 2 mg IM
- 9. In pediatrics treat the presence of any SLUDGEM symptoms with:
 - a. Pediatric: age less than 1 y/o $\,$ pediatric atropine auto-injector IM or atropine 0.5 mg IM
 - b. Pediatric: age greater than 1 y/o 1 adult atropine auto-injector IM or atropine 2 mg IM
- 10. In all cases, continue to monitor closely for worsening symptoms
- 11. If seizures are present, refer to Adult or Pediatric Seizure Protocol, **Gold** 7 or **Pink 6**
- 12. Contact OLMC for Options:
 - a. Repeat dose, as necessary, every 5 minutes
 - b. Administer other selected antidotes

Page 87 Yellow 6

P

Α

Hypothermia #1

Classification	Core Temp	Clinical Presentation
Normal	>95° F / 35° C	Cold sensation/shivering
Mild	90 - 95° F 32 - 35° C	Loss of fine or gross motor skills inability to complete simple thoughts
Moderate	82 - 90° F 28 - 32° C	= 90° F/32° C: Shivering stops<br =86° F/30° C: AMS</td
Severe	= 82° F<br = 28° C</td <td>Rigidity, vital signs reduced/absent. Severe risk of V-fib with mechanical simulation (rough handling)</td>	Rigidity, vital signs reduced/absent. Severe risk of V-fib with mechanical simulation (rough handling)
	= 77° F<br = 25° C</td <td>Spontaneous V-fib cardiac arrest</td>	Spontaneous V-fib cardiac arrest

Bold indicates major thresholds between stages Adapted from "State of Alaska Cold Injuries Guidelines" 2013

Treatment

Severe hypothermia with signs of life/Not in cardiac arrest

EMT

- 1. Prevent further heat loss by insulating from the ground and shielding from wind and water. Move to a warm environment when possible. Gently remove wet clothing. Cover with warm blankets
- 2. Pack thorax with wrapped heat pack
- 3. Consider warmed AND humidified 100% O₂
- 4. High sugar oral fluids if tolerated and (only in mild hypothermia)
- 5. Handle gently. Avoid rough movement and excess activity
- 6. Maintain supine position in moderate or severe hypothermia

ADVANCED EMT/ PARAMEDIC

- 7. Consider one to two 500 mL (20 mL/kg for pediatrics) boluses of NS heated to 104 - 108° F (40 - 42° C)
- 8. Contact OLMC for additional boluses

Page 88 Yellow 7

E

Hypothermia #2

Severe hypothermia without signs of life

Note: Assess for pulse and respirations for 1 minute

Note: Definitive treatment for severe hypothermia without signs of life is rewarming with cardiopulmonary bypass. Do not delay transport of these patients. Do not initiate CPR if it will delay transport.

Do not initiate resuscitation if the patient meets any of the criteria of "**Gray 1** Section II.A" OR Rescuers are exhausted or in a dangerous situation. These patients are deceased.

EMT

E

- 1. Initiate CPR after 1 minute pulse/respiration assessment
- 2. Attach AED and follow prompts.
- 3. Rewarm using techniques as listed under Treatment: Not in Cardiac Arrest (above)
- 4. If no ROSC after 20 minutes of CPR/rewarming, consider termination of resuscitation. Contact OLMC if possible

ADVANCED EMT/PARAMEDIC

- 5. Consider one to two 500 mL (20 mL/ kg for pediatrics) boluses of NS heated to 104 $108^{\rm o}$ F (40 $42^{\rm o}$ C)
- 6. Contact OLMC for additional boluses
- 7. Otherwise treat as per normothermic cardiac arrest management for the patient's dysrhythmia, refer to Cardiac Arrest Protocol, **Red 8**

A P

Page 89 Yellow 8

Hyperthermia - Heat Exhaustion

HEAT EXHAUSTION — Volume depletion due to sweat loss

ASSESSMENT:

If core temperature is obtained, it will be variable, but always below 105° F (40.6° C).

Clinical pattern is essentially that of compensated hypovolemic shock:

- Weakness and vomiting
- Skin is variable. Core shell shunt to increase heat loss competes with shell core shunt to protect volume. Skin is usually pale and moist with variable skin temperature
- Sweating
- Normal consciousness and CNS function

TREATMENT: Goal is to reduce sweating and to restore volume

EMT

E

- 1. Protect the patient from heat challenge. Stop exercise and put patient at rest in a cool, shady place
- 2. Oral fluids can be effective if the patient is not vomiting. Use dilute (less than 5% sugar) fluids given in small sips. Appropriate fluids to use include the World Health Organization's Oral Rehydration Solution OR a "homemade" solution using 1 teaspoon of salt and 8 teaspoons of sugar per 1 liter of water

ADVANCED EMT / PARAMEDIC

- 3. Establish IV
- 4. Perform fluid bolus

A P

Page 90 Yellow 9

Hyperthermia - Heat Stroke

HEAT STROKE — A true medical emergency that requires radical field treatment, usually, but not always, associated with heat exhaustion. Heat stroke is characterized by multisystem organ injury and failure. CNS dysfunction characterized by alterations in mental status is a hallmark distinguishing between heat exhaustion and heat stroke.

ASSESSMENT:

If core temperature is obtained it is 105° F (40.6° C) or greater. Abnormal consciousness and/or CNS function; seizures are common. Any acute change in consciousness/CNS function in the context of a significant heat challenge should be managed as heat stroke without delay. Skin and sweating are variable, depending on volume status. Note that red, dry skin is not a dependable sign of heat stroke.

TREATMENT:

Immediate radical cooling is the urgent priority, followed by volume replacement.

EMT

E

- 1. Cool the patient immediately by any means practical, such as:
 - a. Initiate Radical Cooling which includes: Immerse the patient up to the neck in cold water
 - b. Also consider non- radical cooling which includes, ice packs, wet patient, cool wet sheets, and air conditioning en route
 - c. Consider moistening the skin and fan vigorously. This method is effective only at low ambient humidity
- 2. Discontinue radical cooling if:
 - a. Shivering begins
 - b. Core temperature falls to 102° F (38.8° C).

ADVANCED EMT / PARAMEDIC

- 3. Establish IV
- 4. Perform fluid bolus

A P

Page 91 Yellow 10

Ophthalmology

Eye Pain from Chemical Exposure

E A

EMT / ADVANCED EMT

1. Flush eye with sterile saline or clean water source continuously

PARAMEDIC

- 2. If no penetrating eye trauma and if the patient has no allergy to local anesthetics: Administer 2 drops tetracaine ophthalmologic drops every 5 minutes as needed to affected eye to facilitate eye flushing. This may be repeated for a total of three doses. For further dosing, please contact medical control
 - a. This is to be provided by the Paramedic provider only and not provided to the patient for ongoing use
- 3. To facilitate flushing, the Paramedic may use a Morgan lens if trained to do so

Eye pain all other sources

PARAMEDIC

If no penetrating eye trauma and if the patient has no allergy to local anesthetics (lidocaine, novicaine, bupivicaine, etc.): Administer 2 drops tetracaine ophthalmologic drops every 5 minutes as needed to affected eye. This may be repeated for a total of three doses. For further dosing, please contact medical control.

P

Page 92 Yellow 11

Agitation/Excited Delirium #1

EMT

- 1. Maintain crew safety; ask for law enforcement assistance if available
- 2. Attempt verbal de-escalation using direct, empathetic and calm voice. Present clear limits and options. Respect the patient's personal space. Avoid direct eye contact and assume a non-confrontational posture
- 3. If altered mental status, check oxygen saturation and perform finger stick blood glucose, if so trained

ADVANCED EMT

4. If blood glucose is less than 60 mg/dL, refer to Adult Diabetic/Hypoglycemic Emergencies protocol, **Gold 6**

PARAMEDIC

5. Perform the Altered Mental Status Scale:

Score	Responsiveness	Speech	Facial Expression	Eyes
+4	Combative, very violent, out of control	Loud Outbursts	Agitated	Normal
+3	Very anxious, agitated, mild physical element of violence	Loud Outbursts	Agitated	Normal
+2	Anxious, agitated	Loud Outbursts	Normal	Normal
+1	Anxious, agitated	Normal	Normal	Normal
0	Responds to name in normal tone	Normal	Normal	Clear, no ptosis
-1	Lethargic response to name	Mild slowing or thickening	Mild Relaxation	Glazed or mild ptosis (<half eye)<="" td=""></half>
-2	Responds only if name is called loudly	Slurring or prominent slowing	Mild Relaxation (Slacked Jaw)	Glazed or marked ptosis (<half eye)<="" td=""></half>
-3	Responds only after mild prodding	Few Recognizable Words	Mild Relaxation (Slacked Jaw)	Glazed or marked ptosis (<half eye)<="" td=""></half>
-4	Does not respond to mild prodding or shaking	Few Recognizable Words	Mild Relaxation (Slacked Jaw)	Glazed or marked ptosis (<half eye)<="" td=""></half>

Procedure for AMSS Assessment	Score
1. Observe the patient - if alert, restless, agitated or combative	0 to + 4
2. Say the patient's name in a gentle tone of voice and ask patient to open eyes	-1
3. If no response to voice, continue with routine EMS	-2 to -4

Page 93 Yellow 12

A

E

P

Agitation/Excited Delirium #2

PARAMEDIC

- 7. If Altered Mental Status Score +1, +2 or +3, consider midazolam 4-10 mg **IM** for patient/EMS provider safety and patient comfort. First dose should be based on patient's size, age, and the circumstances causing agitation
- 8. If Altered Mental Status Score +4, consider either:
 - * Midazolam 4-10 mg **IM** for patient/EMS provider safety and patient comfort. First dose should be based on patient's size, age, and the circumstances causing agitation

-OR-

- *contact OLMC for Ketamine 4 mg/kg **IM**. If suspected or known alcohol or sedatives present, consider half dose to minimize respiratory depression. Ketamine may not be used in patients greater than 65 years old
- 9. Monitor and document the following every 5 minutes ECG, O_2 sat, ETCO₂, AMSS, and vital signs
- 10. Contact OLMC for dosing questions or if patient requires repeat dosing.

Pearls for Agitation/Excited Delirium

Agitation - is defined by excessive, purposeless cognitive and motor activity or restlessness, usually associated with a state of tension or anxiety

Excited Delirium - is a sub-category of agitation, with a potential for higher mortality and morbidity. It can be defined by a patient presenting with the following constellation of symptoms (based on the 2009 ACEP White Paper) with frequency in parenthesis:

- Exceptional/abnormal pain tolerance (100%)
- Tachypnea (100%)
- Tactile hyperthermia (95%)
- Unusual strength (90%)
- Police Noncompliance (90%)
- Lack of tiring against restraint (90%)
- Inappropriate clothing for environmental temperature (70%)
- Violent and paranoid behavior
- Rapid development of symptoms
- Rapidly and fluctuating periods of calm and then delirium

These symptoms may be caused by a number of intoxicants, including, but not limited to alcohol, sympathomimetics (cocaine, methamphetamine, MDMA), and dissociative agents (PCP, LSD, dextromethorphan, K2/Spice, Bath Salts, DMT, etc). Early contact of OLMC is essential for proper preparation of the receiving facility and staff.

Page 94 Yellow 13

P

Agitation/Excited Delirium #3

Pearls for Midazolam/Ketamine

Midazolam

- Patients with underlying medical conditions (including COPD/CHF/CAD) as well as patients older than 60 are more likely to suffer adverse effects from midazolam. Consider lower doses in this population.
- WARNING: May cause respiratory depression, arrest, or apnea.
- Assess patients for signs and symptoms of respiratory depression and sedation.
- Administration: **IM** Administer undiluted deep IM into large muscle.
- Administration: **IV** Do not administer intra-arterially. Administer by **slow** IV injection over at least 2 minutes using a concentration of 1 mg/mL or a dilution of the 1 or 5 mg/mL concentrations.
- Concomitant use with opioids: **[US Boxed Warning]:** Concomitant use of benzodiazepines and opioids may result in profound sedation, respiratory depression, coma, and death.

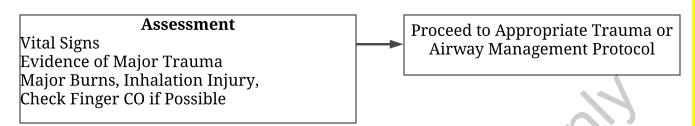

Ketamine

- Document the patient's Altered Mental Status Score (AMSS) in the run report.
- Patients with an AMSS less than 4 are more likely to require airway management.
- Maine EMS Services will be stocking the 100mg/mL concentration to accommodate the wide dose ranges in the protocol. This is to avoid carrying two very different concentrations and risk a serious dose error.
- WARNING: Overdose may lead to panic attacks and aggressive behavior; rarely seizures, increased ICP, and cardiac arrest. Very similar in chemical makeup to PCP (phencyclidine), but it is shorter acting and less toxic.
- Administration: **IM** Inject deep IM into large muscle mass.
- Administration: **IV** According to the manufacturer, administer bolus/induction doses over 1 minute or at a rate of 0.5 mg/kg/minute; more rapid administration may result in respiratory depression and enhanced pressor response. Some experts suggest administration over 2 to 3 minutes (Miller 2010).
- The 100 mg/mL concentration should not be administered IV unless properly diluted with an equal volume of Sterile Water for Injection, NS, or D_5W .

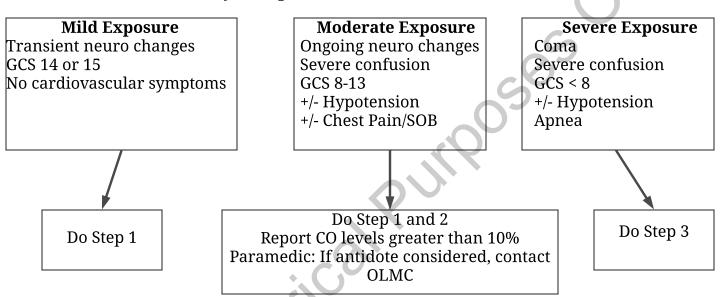

Page 95 Yellow 14

Known or Suspected Cyanide/CO Exposure #1

Don appropriate PPE if necessary, assess patient after evacuation ***Remove patient from source of smoke/inhalation***

Severity of Exposure Definitions (CO, CN, or Combined)

Treatments

Step 1 EMT/AEMT/P

- 1) Administer high flow O_2
- 2) Pulse Ox may be inaccurate in exposure to CO/CN or methemoglobinemia

AEMT/P

3) Monitor rhythm

Step 2 AEMT/P

- 1) Mange Airway as appropriate
- 2) Collect rainbow blood sample tubes per local protocol
- 3) If hypotensive, administer IV bolus, may repeat x 1
- 4) 12-lead ECG

Step 3 Paramedic

In case of CN toxicity, either alone or in combination with CO exposure:

- 1) Adult: Cyanokit 5 g **IV**. May repeat x 1 for partial response
- 2) Peds: Cyanokit 70 mg/kg **IV**, 2.5 g for weight less than 30 kg

Page 96 Yellow 15

Known or Suspected Cyanide/CO Exposure #2

PEARLS for CO/Cyanide Exposure:

- Carbon monoxide (CO) and Hydrogen cyanide (HCN) gases are chemical asphyxiants that can kill rapidly. Carbon monoxide is odorless. Only 40% are able to detect the almond smell of CN. Cyanide is generated by combustion of synthetic materials present in many structural fires.
- Appropriate PPE includes self-provided air/oxygen source (i.e. SCBA). Scene safety is the top priority. No patient decontaminaion is required for victims evacuated from CN gas exposure.
- It is rare for viable CO exposed patients to have persistent unconsciousness requiring intubation.
- Sources of CN: Structural fire (HCN), industrial cyanide salts*, unripe cassava, apricot pits, laetrile, etc.
- If injuries incompatible with life, DO NOT GIVE ANTIDOTE.

*may persist on skin, however water decontamination may liberate HCN gas.

Page 97 Yellow 16

Drowning/Submersion Injuries Adult and Pediatric

EMT

- 1. If C-spine injury suspected, stabilize C-spine
- 2. Obtain specific history including time, temperature, associated injury, etc.
- 3. Begin resuscitation efforts while removing patient from the water
- 4. Consider hypothermia, refer to Hypothermia protocol, Yellow 7
- 5. Remove wet clothes and warm the patient
- 6. Conscious patients with submersion injuries should be transported to the hospital for further evaluation
- 7. If water temperature is estimated to be less than 43° F and submerged
 - a. Less than 90 minutes initiate full resuscitation
 - b. Greater than 90 minutes consider not initiating resuscitation or termination of resuscitation
- 8. If water temperature is estimated to be greater than 43° F and submerged
 - a. Less than 30 minutes initiate full resuscitation
 - b. Greater than 30 minutes consider not initiating resuscitation or termination of resuscitation

A P

E

ADVANCED EMT/PARAMEDIC

- 9. Consider CPAP to supplement the patient's own respiratory effort
- 10. Reassure anxious patients
- 11. If near drowning incident involves scuba diver, suggesting barotrauma, contact OLMC and consider hyperbaric treatment facility

PEARLS for Drowning:

- Fresh and salt water drowning are treated the same in the field; treatment must be directed toward correcting severe hypoxia.
- Factors affecting survival include the patient's age, length of time submerged, general health of the victim, type and cleanliness of liquid medium and water temperature that may contribute to the effectiveness of the mammalian diving reflex (decreased respirations, decreased heart rate, and vasoconstriction, with maintenance of blood flow to the brain, heart and kidneys).
- All drowning/near drowning victims with suspected barotrauma/decompression sickness should be transported in the left lateral Trendelenburg position to prevent any emboli in the ventricles from migrating to the arterial system.
- Even patients that are conscious and appear well after a submersion event require hospital level evaluation and observation as they may develop delayed symptoms.

Reference - Michael J. Tipton, Frank St. C. Golden, November 2010. "A proposed decision- making guide for the search, rescue and resuscitation of submersion (head under) victims based on expert opinion". *Resuscitation*. (2011) 82; 819–824.

Page 98 Yellow 17

Brief Resolved Unexplained Event (formerly known as ALTE)

PEARLS

Definition of Brief Resolved Unexplained Event (BRUE):

These are sudden, brief (less than 1 minute), now resolved (returned to baseline) episode of at least one of the following in a child less than 2 years old:

- 1. Cyanosis or pallor
- 2. Absent or decreased, or irregular breathing
- 3. Marked change in tone (hyper- or hypotonia)
- 4. Altered level of responsiveness

NOTE: Most children who experience a BRUE have a normal physical exam when assessed by responding prehospital personnel, however, almost 50% will have an underlying condition requiring comprehensive medical care.

EMT/ADVANCED EMT /PARAMEDIC:

- 1. Obtain medical history
 - a. Determine the severity, nature, and duration of the episode
 - b. Was the patient awake or sleeping at the time of the episode?
 - c. Include details of the resuscitation, if applicable
- 2. Keep the child warm and transport to the emergency department
- 3. Contact OLMC for assistance if the parent/guardian refuses medical care and/or transport

E A P

Page 99 Pink 1

Nausea and Vomiting

E

Α

Nausea and vomiting are symptoms of some other illness. Therefore, this is a supplemental protocol to be used in addition to other relevant protocols.

EMT/ADVANCED EMT

1. Transport in position of comfort

PARAMEDIC

For Pediatric Patients:

- 2. If over 4 years old, ondansetron **ODT** 4 mg **PO**
- 3. If nausea not controlled by ondansetron **ODT** or child under the age of 4 years,
 - a. Consider IV placement
 - b. Ondansetron 0.1 mg/kg IV/IM (maximum single dose 4 mg)
 - c. Consider 10-20 mL/kg 0.9% NS IV fluid bolus for dehydration even if vital signs are normal.

Contact OLMC for dosing questions, abnormal vital signs, or coincident drug use (including alcohol) by patient

P

Page 100 Pink 2

Pediatric Pain Scale #1

For Treatment options go to Universal Pain Management Green17

EMT/ADVANCED EMT/PARAMEDIC

EAP

Have the patient rate his/her pain from 0-10, or on an another appropriate pain scale:

- a. Ages less than 4 years, use FLACC Scale
- b. Ages 4-12 years, use Wong Baker "Faces" Scale
- c. Avoid coaching the patient; simply ask him/her to rate his/her pain on a scale from 0-10, where 0 is no pain at all, and 10 is the worst pain ever experienced by the patient

FLACC Scale: Objective measurement of pain in younger children

The FLACC Behavioral Pain Assessment Scale				
Catagories	Scoring			
Categories	0	1	2	
Face	No particular expression or smile	Occasional grimace or frown, withdrawn, disinterested	Frequent to constant frown, clenched jaw, quivering chin	
Legs	Normal position or relaxed	Uneasy, restless, tense	Kicking or legs drawn up	
Activity	Lying quietly, normal position, moves easily	Squirming, shifting back and forth, tense	Arched, rigid, or jerking	
Cry	No cry (awake or asleep)	Moans or whimpers, occasional complaint	Crying steadily, screams or sobs; frequent complaints	
Consolability	Content, relaxed	Reassured by occasional touching, hugging or being talked to; distractable	Difficult to console or comfort	

Each of the five categories is scored from 0-2, resulting in a total score between 0 and 10.

(Continued)

Page 101 Pink 3

Pediatric Pain Scale #2

(Continued)

Wong-Baker "Faces " Scale: The faces correspond to the numeric values from 0-10. The scale can be documented with the numeric value or the textual pain description

PEARLS

Intranasal application of fentanyl is the preferred route of administration unless an IV needs to be established for other reasons. If a nasal atomizer is not available AND an IV cannot be established, Paramedic providers may use the intramuscular route as follows:

- Fentanyl 1 mcg/kg **IM** every 5 minutes for moderate to severe pain
- Reassess every 5 minutes
- If pain persists, a nasal atomizer remains unavailable and the transport time dictates, the IV route is preferred for repeated doses of medications
- Repeat IV doses of fentanyl may be provided as above

E A P

Page 102 Pink 4

Pediatric Coma (Decreased Level of Consciousness)

NEVER ADMINISTER NALOXONE TO A NEONATE

EMT

E

- 1. Immobilize spine if indicated
- 2. Manage airway as appropriate per Blue 5
- 3. Request ALS if available
- 4. If shock present, refer to Medical Shock protocol, **Pink 14**
- 5. Perform finger stick to measure blood glucose, if so trained. If blood glucose is less than 60 mg/dL, refer to **Pink 13**
- 6. If respirations less than 12 per minute AND narcotic overdose suspected, refer to Antidotes for Specific Toxins: Opiates protocol, **Yellow 5**

ADVANCED EMT/PARAMEDIC

- 7. IV en route
- 8. Cardiac monitor

A P

Page 103 Pink 5

Pediatric Seizure #1

EMT

- 1. Manage airway as needed per **Blue 5**
- 2. Spinal immobilization if indicated
- 3. Protect the patient from self-injury
- 4. Perform finger stick to measure blood glucose, if so trained. If blood glucose is less than 60 mg/dL, refer to **Pink 13**
- 5. Request ALS

Α

E

ADVANCED EMT

- 6. Cardiac monitor
- 7. IV access en route

PARAMEDIC

- 11. Administer **IM** midazolam if no **IV** is established. If an IV is established, administer midazolam via the IV route:
 - a. Intramuscular dosing midazolam 0.2 mg/kg **IM** to maximum dose of 10 mg
 - b. Intravenous dosing midazolam 0.1 mg/kg IV maximum 5 mg
 - c. Alternate routes to **IM/IV** dosing:
 - i. Intranasal dosing midazolam 0.2 mg/kg ${
 m IN}$ over 15 sec, one half of dose into each nostril to a maximum dose of 6 mg

Page 104 Pink 6

Pediatric Seizure #2

- 12. Monitor oxygenation and ventilation with O_2 saturation and $EtCO_2$ in all patients receiving midazolam, especially if providing repeated doses of midazolam
- 13. Manage the patient's airway as necessary

PEARLS for Seizures:

Intranasal dosing must be performed with concentrated midazolam. The maximum volume of medication absorbed per nostril is 1 mL.

Most seizures are self-limited. Unless a specific underlying condition exists (i.e. diabetes with hypoglycemia), treatment of a seizure or multiple seizures with a total duration of less than 5 minutes should focus on patient protection and oxygenation.

For patients with Vagus Nerve Stimulator who are having repeated/continuous seizure activity, consider activation of the Vagus Nerve Stimulator, if not already attempted, by holding the patient's hand-held magnet over the Vagus Nerve Stimulator.

Page 105 Pink 7

Pediatric Respiratory Distress

EMT

- 1. If adequate ventilation, let child assume position of comfort
- 2. O_2 allow patient or parent to assist in administration
- 3. Attempt to discern between upper airway respiratory distress (stridor) or lower airway respiratory distress (wheezing)
 - a. If stridor is found, proceed to Pediatric Respiratory Distress with Inspiratory Stridor protocol, **Pink 12**. If wheezing is found, proceed to Pediatric Respiratory Distress with Wheezing protocol **Pink 10**
- 4. Request ALS if available
- 5. If inadequate ventilation:
 - a. If foreign body suspected, use the AHA Foreign Body Airway Obstruction protocol
 - b. IF CHILD HAS INSPIRATORY STRIDOR, ESPECIALLY IF LEANING FORWARD OR IN THE SNIFFING POSITION, THEN:
 - i. Put child in position of comfort
 - ii. **DO NOT ATTEMPT** ANY PROCEDURE/MANEUVER (INCLUDING EXAMINATION OF OROPHARYNX) WHICH MAY INCREASE CHILD'S ANXIETY AND THEREBY RAISE CHANCES OF LARYNGOSPASM UNLESS ABSOLUTELY NECESSARY TO PRESERVE AIRWAY
- 6. Open airway if needed, ventilate with bag-valve-mask if inadequate ventilation. In epiglottitis, this may require forceful ventilation, including closure of pop-off valve on BVM, and use of cricoid pressure (Sellick's maneuver) to prevent gastric distention
- 7. Constantly monitor airway for patency in any unconscious child

ADVANCED EMT / PARAMEDIC

8. Proceed to Pediatric Respiratory Failure protocol, Pink 9 as necessary.

A I

E

Page 106 Pink 8

Pediatric Respiratory Failure (With or without obstruction)

Prehospital providers should consider patient age, diagnosis, transport time, provider experience, and effectiveness of ongoing bag-mask ventilation in considering whether to continue with bag- mask ventilation versus proceeding to further airway management procedures. Bag- mask ventilation has been shown to be equivalent to endotracheal ventilation in pediatric patients in most situations with short transport times. If suspected opiate overdose, refer to naloxone dosing under Pediatric Coma protocol, **Pink 5.**

E

EMT

- 1. Airway management per Blue 5
- 2. Request ALS if available

A

ADVANCED EMT

- 3. Cardiac monitor
- 4. IV/IO en route
- 5. Pulse oximetry if available

PARAMEDIC

- 6. Magill forceps if indicated
- 7. OG Tube if indicated

P

Page 107 Pink 9

Pediatric Respiratory Distress with Wheezing #1

Wheezing in the child less than 2 years old is very commonly due to bronchiolitis. Bronchiolitis is a self-limited viral illness of the bronchioles, marked by edema but not smooth muscle contraction. Bronchiolitis is the most common cause of wheezing in children under the age of 2. The treatment goals are to maintain oxygenation and hydration and to monitor for apnea and respiratory distress. Because the etiology is different than asthma, the treatment options are also very different. Patients suffering from bronchiolitis should not receive inhaled albuterol or intravenous steroids. Instead, provide oxygen to ensure O_2 sats greater than or equal to 90% and nasal suctioning with bulb syringe. Patients who fail these measures or decompensate may benefit from nebulized epinephrine. Monitor for apnea or respiratory distress and, if encountered, manage the patient's airway as indicated per **Blue 5**, Pediatric Airway Algorithm.

E

EMT

Contact OLMC for the following OPTIONS:

- 1. Assist the patient in self-administering 5 puffs of their rescue inhaler.
- 2. If uncertainty regarding the type of inhaler, contact OLMC for permission to assist patient with self-administered bronchodilator (using spacer if available*). Inform OLMC of the name of the inhaler. OLMC will prescribe the number of puffs
 - * If Spacer unavailable and Advanced EMT/Paramedic present, they should use nebulizer instead

ADVANCED EMT

3. Contact OLMC to administer albuterol, 2.5 mg by nebulization (use 3 mL premix or 0.5 mL of 0.5% solution mixed in 2.5 mL of normal saline)

Α

(Continued on next page)

Page 108 Pink 10

Pediatric Respiratory Distress with Wheezing #2

PARAMEDIC

- 4. If expiratory wheezing with spontaneous ventilation, use the following OPTIONS:
 - a. Albuterol 2.5 mg by nebulization. **May repeat 1 time**-OR-
 - b. Ipratropium bromide 0.5 mg /albuterol sulfate 3 mg nebulizer if greater than 1 year of age and more significant respiratory distress, and may repeat one time
 - c. For patients known to have asthma: dexamethasone 0.6 mg/kg to a max dose of 10 mg IV/IM/IO x 1 dose
- 5. Contact OLMC for the following options:
 - a. Epinephrine: If < 30 kg, 0.15 mg **IM** of 1:1,000 (1mg/mL), If > 30 kg, 0.3 mg **IM**, 1:1,000 (1mg/mL) in anterolateral thigh OR inhalation of nebulized solution of 1 mL, 1:1,000 (1mg/mL) epinephrine mixed with 2 mL normal saline solution. *
 - b. For patients in status asthmaticus or not responding to repeated nebulizers or the above therapy, consider Magnesium Sulfate 25-50 mg/kg IV/IO x 1 dose over 10 minutes, (maximum single dose is 2 grams) consider placing this medication on a pump
- * Nebulized epinephrine may be contraindicated in children with a history of congenital heart disease.

Asthmatic patients:

Airway management of asthmatic patients is primarily pharmalogical, not mechanical. Therefore, the focus should be on taking those actions that enable the provider to provide inhaled bronchodilators and, in patients with severe bronchospasm, obtain rapid IV or IO access, administer IV magnesium, administer IV dexamethasone, and consider IM EPINEPHrine. Due to the pathophysiology of asthma, positive pressure ventilation (facemask, BIAD, or endotracheal intubation) rarely if ever is an effective treatment without pharmacological intervention. Therefore, unless the patient is apneic, provide supplemental oxygen via non-rebreather and focus on providing pharmacological interventions.

P

Page 109 Pink 11

Pediatric Respiratory Distress with Inspiratory Stridor

Inspiratory stridor may be due to many causes in the pediatric population, including croup, foreign body aspiration, or epiglottitis.

Stridor refers to upper airway obstruction as in laryngotracheitis/croup, and is often accompanied by hoarseness and/or a barking cough (seal-like cough).

As stridor worsens in severity, the following may also be observed: tachypnea, retractions, accessory muscle use, nasal flaring, fatigue from respiratory effort, and cyanosis.

EMT / ADVANCED EMT

- 1. Humidified O_2 , if available, as appropriate with upright posture
- 2. If needed, assist ventilations with PPV using 100% O₂
- 3. Request ALS if available

PARAMEDIC

- 4. Contact OLMC for the following OPTION:
 - a. Inhalation of nebulized solution of 1 mL 1:1,000 (1mg/mL) EPINEPHrine mixed with 2 mL normal saline solution*

D

E

Α

Page 110 Pink 12

^{*} Nebulized EPINEPHrine may be contraindicated in children with a history of congenital heart disease

Pediatric Diabetic/Hypoglycemic Emergencies

EMT

E

Α

- 1. Manage airway as appropriate
- 2. Request ALS if available
- **3.** If trained, perform finger stick to measure blood glucose
 - a. If blood glucose is less than 60 mg/dL, and patient is conscious and able to swallow, give glucose orally
- **4. If not trained** to perform and patient is a known diabetic, has a known low blood sugar, or has an altered mental status, and if the patient is conscious and able to swallow, give glucose orally

Glucose paste is to be administered as soon as possible, if the patient is conscious and able to swallow, and presenting with the signs/symptoms of diabetic emergency

ADVANCED EMT

- 5. IV en route
- 7. Cardiac monitor
- 8. If blood glucose less than 60 mg/dL contact OLMC for OPTION of administering 10% dextrose ($D_{10}W$) **IV/IO**. Recheck blood glucose in 5 minutes Use the following table for D_{10} dosing:

Weight (Kg/Lbs) Volume to be infused

10/22 50 mL

20/44 100 mL

30/66 150 mL

40/88 200 mL

9. If blood glucose greater than 300 mg/dL, give 10 mL/kg NS fluid challenge

AEMT, in consult with OLMC, may modify the Paramedic response as appropriate.

PARAMEDIC

- 10. If IV, IO access is unavailable administer glucagon:
 - a. If less than 20 kg = 0.5 mg IM.
 - b. Greater than 20 kg = 1 mg IM
- 11. Repeat glucose measurement

12. Contact OLMC for OPTION of repeating dextrose

P

Page 111 ______ Pink 13

Pediatric Medical Shock #1

Pediatric shock is well established before the appearance of classic signs and symptoms. The earliest signs and symptoms of pediatric shock include delayed capillary refill, alterations in mental status, rising pulse, and increasing respiratory rate. By the time blood pressure drops, circulatory collapse is near. Consider sepsis in certain high-risk clinical settings.

PEARLS for High Risk Features:

High-risk features for invasive infection include malignancy, bone marrow or solid organ transplant, asplenia, presence of indwelling central line/catheter, or other situation with immune deficiency, compromise or suppression.

Refer to Hypovolemic Shock protocol, if appropriate, **Green 13**. Refer to Allergy and Anaphylaxis protocol, if appropriate, **Gold 1**. Refer to Cardiogenic Shock protocol, if appropriate, **Red 17**. Refer to Pediatric Airway Algorithm, if appropriate, **Blue 5**.

IDENTIFICATION OF POSSIBLE SEPSIS

- Suspected Infection YES
- Temperature $> 101^{\circ}$ F or $< 96.8^{\circ}$ F ($> 38.3^{\circ}$ C or $< 36^{\circ}$ C)
- Heart rate or respiratory rate greater than normal limit for age (NOTE: heart rate may not be elevated in a septic hypothermic patient) AND at least one of the following indications of altered organ function:
 - Altered mental status
 - Capillary refill time < 1 second (flash) or > 3 seconds
 - Mottled cool extremities
 - Lactate (if available) > 2 mmol/L

Note: Consider early contact with **OLMC** for suspected pediatric sepsis patients

Upper Limit of Pediatric HR & RR					
Age	Heart Rate	Resp Rate			
0 day-<1 mo	> 205	> 60			
1mo - <3 mo	> 205	> 60			
3 mo - <1 y	> 190	> 60			
1y - <2 y	> 190	> 40			
2y - <4y	> 140	> 40			
4y - <6y	> 140	> 34			
6y - <10y	> 140	> 30			
10y - <13y	> 100	> 30			
13 y or older	> 100	> 16			
*ACP "an Emergeno	v Department	Septic Shock			

*ACP "an Emergency Department Septic Shock Protocol and Care Guideline for Children Initiated at Triage"

EMT

- 1. Attempt to identify cause (i.e. anaphylaxis, GI bleed, etc.)
- 2. O₂ and airway management as appropriate
- 3. Keep child warm and dry
- 4. Request ALS Transport

E.

Page 112 ______ <u>____Pink 14</u>

Pediatric Medical Shock #2

ADVANCED EMT

- 6. Consider causes
 - a. Massive GI bleed, vomiting, diarrhea, refer to Hypovolemic Shock protocol, **Green 13**
 - b. Cardiogenic Shock Treat per **Red 17**
 - c. Anaphylaxis Treat per Gold 1
 - d. Undifferentiated Shock or Suspected Severe Sepsis
 - i. Assess for pulmonary edema (crackles in the lungs)
 - ii. If available and trained, perform point of care lactate
 - iii. Administer 20 mL/kg NS bolus over 5 15 minutes. Immediately reassess patient. If needed, repeat up to 2 times (total of 60 mL/kg).
 - iv. Notify receiving hospital

PARAMEDIC

- 7. For presumed septic shock or shock of unknown origin
 - a. Treat as per Advanced EMT 6 above
 - b. If no response to initial treatment:
 - i. Contact medical control to discuss additional fluid bolus versus initiating NOREPInephrine **IV infusion**. NOTE: NOREPInephrine in the pediatric patient MUST be infused by a pump.
 - A. NOREPInephrine (8 mg in 250 mL NS). Starting dose 0.03 mcg/kg/min. Titrate by 0.03 mcg/kg/min every 3-5 minutes. Usual dose is 0.03-0.25 mcg/kg/min. Usual max dose is 0.6 mcg/kg/min. Absolute max dose is 3 mcg/kg/min.
 - B. Titrate to maintain SBP greater than 80 mmHg

Additionally, if the patient is found to have Adrenal Insufficiency (via medic alert bracelet, patient records, or family/staff reports), administer dexamethasone as follows:

- a. Dexamethasone 0.6 mg/kg to a max dose of 10 mg IV/IM/IO x 1 dose
- b. May provide patient's own dose of hydrocortisone (Solu-cortef) at the patient's physicians prescribed dose if patient provided medications are available

P

Α

Page 113 Pink 15

Pediatric Medical Shock #3

PEARLS for Medical Shock

Many pediatric patients with shock have associated hypoglycemia. Mortality is increased if this is not addressed. Also, the presenting symptoms of shock and those of hypoglycemia can be very similar.

Patients in shock require frequent reassessment. The following physiologic parameters are appropriate endpoints for therapy: normalization of heart rate, capillary refill, mental status, resolution of existing hypotension and, if available, presence of urine output.

In children under the age 6, prompt IO placement after one failed IV attempt should be considered, since timely, successful IV placement in this age group is shown to be difficult for pre-hospital providers.

PEARLS for Cardiogenic Shock

Pediatric patients suffering from suspected cardiogenic shock should receive boluses of 10 mL/kg with frequent reassessment for tolerance and need for additional fluids.

Page 114 Pink 16

Pediatric Cardiac Arrest (Non-breathing, pulseless patient)

E

Pediatric cardiac dysfunction is usually due to a respiratory cause and is thus more likely to initially respond to effective oxygenation and ventilation, then fluid administration and then medications may be needed. Defibrillation alone is rarely successful.

EMT

- 1. 100% O₂ and ventilate with bag valve mask
- 2. CPR first, and use AED per current AHA guidelines
- 3. Request ALS if available

ADVANCED EMT / PARAMEDIC

- 4. Manage airway as needed, refer to **Blue 5** (consider possibility of foreign body obstruction)
- 5. Initiate IV/IO
- 6. Cardiac monitor and treat dysrhythmias according to protocol using pediatric dosages listed below
- 7. For traumatic cardiac arrest give IV/IO bolus of 20 mL/kg IV fluid. **May be repeated once**

Contact OLMC for option of medications, fluid boluses, defibrillations, or other ongoing interventions that may be necessary.

A P

Page 115 Pink 17

Pediatric Cardiac Arrest Medications & Dosages

Pre-hospital providers should consider patient age, diagnosis, transport time, provider experience, and effectiveness of ongoing bag-mask ventilation in considering whether to continue with bag-mask ventilation versus proceeding to endotracheal intubation. Bag-mask ventilation has been shown to be equivalent to endotracheal ventilation in pediatric patients in most situations with short transport times.

Atropine 0.02 mg/kg (indicated for use in Bradycardia)	IV/IO: Minimum dose: 0.1 mg Maximum single dose: 0.5 mg (child), may repeat once
EPINEPHrine (Doses in Bradycardia)	IV/IO: 0.01 mg/kg (1:10,000, 0.1 mL/kg) to a max single dose of 1 mg
EPINEPHrine (Doses in Asystole/Pulseless Arrest)	IV/IO: 0.01 mg/kg (1:10,000, 0.1 mL/kg) Maximum single dose of 1 mg Repeat every 3-5 minutes
Amiodarone	5 mg/kg IV/IO Bolus: can repeat up to total dose of 15 mg/kg. Maximum single dose: 300 mg
Sodium Bicarbonate (Indications: wide complex PEA suggesting hyperkalemia or sodium channel blocker overdose) Common sodium channel blockers include: tegretol, carbamazepine, TCA's, propranolol, and flecanide	IV/IO: 1 to 2 mEq/kg bolus Maximum single dose: 50 mEq, repeat every 5 minutes until QRS duration less than 120 msec
Magnesium (Indication: Torsades de Pointes, moderate/severe asthma)	IV/IO: 25-50 mg/kg Maximum single dose: 2 g

Synchronized Cardioversion: 0.5 - 1.0 J/kg (initial); 2 J/kg (subsequent) Defibrillation: 2 J/kg (initial); 4 J/kg (subsequent) or equivalent biphasic energy

Page 116 ______ Pink 18

Childbirth

EMT/ADVANCED EMT/PARAMEDIC

- 1. Encourage mother to relax, breathe slowly, and let baby come
- 2. If hypotensive, roll patient onto left hip
- 3. If the presenting part is the cord, apply pressure to the baby with a sterile, gloved hand to keep pressure off the cord. Raise mother's hips onto pillows. Keep cord warm. Do not clamp or cut cord
- 4. Request ALS if available and DO NOT DELAY TRANSPORT
- 5. If baby's head is delivering:
 - a. Do not hurry or slow the birth
 - b. Check to see if cord is wrapped around neck. If so, attempt to slip the cord over the baby's head. Do not clamp and cut the cord unless it appears to obstruct the birth
 - c. Place baby immediately skin-to-skin with the mother. Dry baby, examine and keep warm (next to mother's skin). As soon as possible, enable child to nurse at mother's breast
 - d. Assess APGAR SCORE at 1 and 5 minutes, refer to APGAR Score Pink 20
 - e. Do not externally massage the uterus en route until placenta has delivered
 - f. Do not forcibly remove placenta
 - g. The cord may be left intact, or it may be double clamped and cut only when 1) the baby is breathing and all cord pulsations have stopped (usually within 3 to 5 minutes), or; 2) the baby must be moved to allow for advanced newborn resuscitation
 - h. If placenta is delivered, wrap and package with cord intact
- 6. If delivery has occurred, maintain the child on the mother's chest/abdomen immediately after birth to maintain warmth. During transport, the child should be placed in an appropriate child passenger restraint system with the head supported. Maintain warmth during transport. Consider wrapping the child and placing a hat to minimize heat loss. *Monitor the baby's airway during transport while in a child safety seat.*

E A P

Page 117 Pink 19

APGAR Score

Assess the baby at 1 minute and again at 5 minutes

DO NOT DELAY RESUSCITATION to obtain APGAR Score

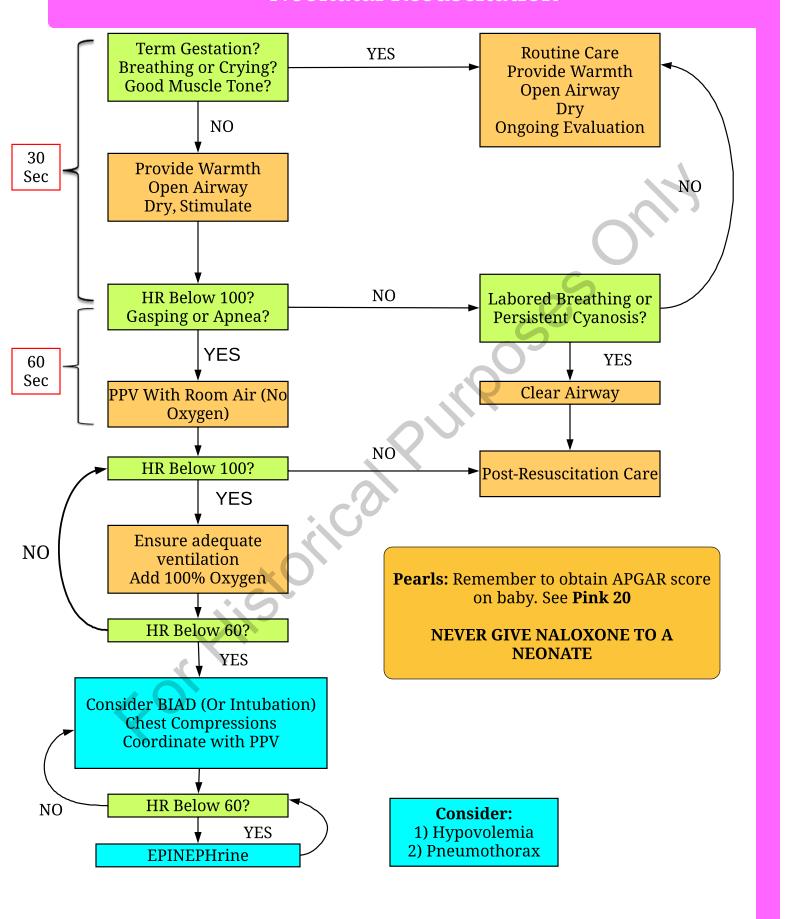

A score of less than 7 suggests need for resuscitation with suction, ventilation, and ALS back up

		APGAR Score		4
		0	1	2
A	Appearance	Blue or Pale	Body Pink/ Hands Blue	Pink
P	Pulse	Absent	less than 100	greater than 100
G	Grimace*	None	Grimace	Cough
A	Activity**	Flaccid	Some	Good
R	Respiration	Absent	Weak	Good

^{*} Tested by a suction catheter or bulb syringe tip gently placed in the nose or mouth ** Amount of spontaneous flexion of extremities

KING	0	1	1	1	2	2	2	2.5	2.5

For ET size, pinky finger diameter in a child affords an acceptable approximate of ET tube outer diameter. The formula for tube size is as follows: "Age (in years)/4 + 4" and the Broselow-Hinkle Tape may be used for internal diameter determination. Using a tube one size larger or smaller than this guideline is also acceptable.

Page 121 Pink 23

I. When to Start Resuscitation:

As soon as the absence of pulse and respiration is established.

II. When Not to Start Resuscitation:

- **A. All Patients:** Any patient displaying obvious and accepted signs of irreversible death such as rigor mortis, dependent lividity, decapitation, decomposition, incineration, other obvious lethal injuries, evidence of central freezing (such as ice in the airway), core temperature less than 50 degrees F, chest wall so stiff that compressions cannot be performed, or patients submerged in cold water (for specific recommendations in drowning, refer to Drowning Protocol, **Yellow 17**)
- **B. All Normothermic Patients:** Major trauma victims who have no respiration and no pulse, no sign of life at the time of Maine EMS licensed crew member arrival
- C. When a **Do Not Resuscitate (DNR)** order is presented in one of three forms:
 - **1.** EMS DNR orders from other state EMS/DNR programs. If the order or device (i.e., plastic bracelet, jewelry, or card) appear to be in effect, and understandable to the crew, follow the order's specific instructions. If there are no specific instructions beyond "DNR", follow Maine EMS Comfort Care/DNR Guidelines
 - 2. Non-EMS actionable medical order (i.e. POLST/MOLST, etc.): A written order executed by a patient's personal physician/PA/NP should be honored if it is understandable to the crew and if it is dated within 1 (one) year. Follow the order as written. If it is nonspecific as to care to provide or withhold, follow the MEMS Comfort Care/DNR guidelines
 - **3.** Maine EMS Comfort Care / DNR Program A Maine EMS Comfort Care/DNR order does not have an expiration date. Once activated, it remains in effect until the patient or someone acting on their behalf as described and authorized on the Comfort Care/DNR form cancels it. (Note: Although no longer distributed by Maine EMS, extant DNR/Comfort Care "orange" forms, wallet cards and plastic bracelets remain valid)
- **D.** When a signed Maine EMS Do Not Resuscitate Directive form or Maine EMS- approved Do Not Resuscitate Directive jewelry is presented to EMS personnel. Once executed by the patient and signed by a physician, physician's assistant or nurse practitioner, the Do Not Resuscitate Directive remains in effect until the expiration date on the form or, if no expiration date is noted on the form, until the patient cancels it
- **E.** A photocopy is acceptable as proof of the existence of valid DNR Order or DNR Directive, provided that the photocopy is legible and understandable by EMS personnel

(continued next page)

Page 122 Grey 1

III. Treatment/Comfort Care

- **F.** When treating a patient with a Maine EMS Comfort Care/DNR Order or Do Not Resuscitate Directive, the responding EMS provider should perform routine patient assessment and resuscitation or intervention until EMS personnel verify:
 - 1. That an EMS Comfort Care/DNR Order or Do Not Resuscitate Directive exists; or,
 - **2.** That a Maine EMS-approved EMS Comfort Care/DNR wallet card, plastic bracelet or Maine EMS-approved DNR jewelry is present, intact and not defaced. The plastic bracelet may be worn on the wrist or ankle or on a necklace; or,
 - **3.** That Maine EMS-approved Do Not Resuscitate Directive jewelry is present, intact and not defaced; and,
 - **4.** The identity of the patient through family or friends present, or with photo ID such as a driver's license. A good faith effort only is required
- **G.** Follow these EMS Comfort Care/DNR procedures in all cases:

1. These comforting interventions are encouraged:

- a. Open the airway manually (NO intubation, No BVM unless invited by conscious patient);
- b. Suction and provide oxygen;
- c. Make the patient comfortable (position, etc.);
- d. Control bleeding;
- e. Pain and other medications of comfort to a conscious patient only (ALS per On Line Medical Control);
- f. Be supportive of the patient and family;
- g. Contact patient's physician/PA/NP or On Line Medical Control if questions or problems
- **2. Resuscitative measures to be avoided:** (to be withheld, or withdrawn if resuscitation has begun prior to confirmation of EMS Comfort Care/DNR Order or Do Not Resuscitate Directive status).
 - a CPR
 - b. Intubation (ET Tube, or other advanced airway management);
 - c. Surgical procedures;
 - c. Defibrillation:
 - d. Cardiac resuscitation medications;
 - e. Artificial ventilation by any means;
 - f. Related procedures per On Line Medical Control.

(continued next page)

Page 123 Grey 2

IV. Revocation, Documentation & When to Stop Resuscitation

H. Who may revoke an EMS Comfort Care/DNR Order or Maine Do Not Resuscitate Directive:

- **1.** The patient (by destroying EMS Comfort Care/DNR Order Form, wallet card, plastic bracelet and DNR jewelry, or by destroying the Do Not Resuscitate Directive and DNR jewelry, or verbally withdrawing the order or directive);
- 2. For the EMS Comfort Care/DNR Order form only:
 - a. The patient's physician/PA/NP who signed the order;
 - b. The Authorized Decision-Maker for the patient who signed the order.

I. Documentation:

- 1. Use the Maine EMS patient/run report.
- 2. Describe assessment of patient's status.
- **3.** Document which identification (i.e., form, wallet card, plastic bracelet or DNR jewelry) was used to confirm EMS Comfort Care/DNR or Do Not Resuscitate Directive status and indicate that it was intact and not canceled.
- **4.** Indicate the patient's physician/PA/NP name, on the patient/run report.
- **5.** If the patient has expired on arrival, comfort the family and follow your EMS agency's procedure for death at home. A Maine EMS patient/run report still needs to be completed.
- **6.** If transporting the patient, EMS providers should keep the original EMS Comfort Care/DNR Order Form, wallet card, plastic bracelet, Do Not Resuscitate Directive Form or DNR jewelry with the patient.

J. When to Stop Resuscitation: Resuscitation should be terminated:

1. Unwitnessed Arrest:

- a. When the patient regains pulse/respiration
- b. When the patient remains in a non-shockable rhythm (PEA/Asystole) for > 20 minutes OR unresponsive to advanced cardiac life support with a non-shockable rhythm after 20 minutes of resuscitation.
- c. When irreversible signs of death, such as dependent lividity, pupils fixed and dilated, palpable hypothermia (not from exposure) and no audible heart sounds are noted in a patient with unknown downtime or downtime > 20 minutes.
- d. When the rescuers are physically exhausted or when equally or more highly trained health care personnel take over
- e. When it is found that the patient has a DNR order or other actionable medical order (i.e. POLST/MOLST etc.) form.
- f. Continue resuscitation if conditions on scene are NOT amenable to cessation of resuscitation
- g. Continuation of resuscitation beyond these protocols must be in consultation with OLMC

(continued next page)

Page 124 Grey 3

2. Witnessed arrest:

- a. When the patient regains pulse/respiration
- b. When the patient remains in a non-shockable rhythm (PEA/Asystole) for > 20 minutes OR unresponsive to advanced cardiac life support with a non-shockable rhythm after 20 minutes of resuscitation.
- c. In the absence of ALS, when the same Maine EMS licensed crew member has determined the absence of all vital signs for 20 minutes, in spite of BLS, except in the case of hypothermia.
- d. When the rescuers are physically exhausted or when equally or more highly trained health care personnel take over.
- e. When it is found that the patient has a DNR or other actionable medical order (i.e. POLST/MOLST etc.) form.
- f. Continue resuscitation if conditions on scene are NOT amenable to cessation of resuscitation
- g. Continuation of resuscitation beyond these protocols must be in consultation with OLMC

V. Management of Bodies

If resuscitation efforts are discontinued, follow your service's policy for disposition of patient remains. In cases of uncertainty, arrangements should be made with On Line Medical Control with regards to disposition of the body. Contact your local ED with regard to tissue donation options and procedures in advance.

Page 125 Grey 4

Death Situations for Emergency Responders #1

PREPARED JOINTLY BY: Attorney General, Office of Chief Medical Examiner, and Maine State Police.

GENERAL AIM: Preservation of scene, including body as found, for investigative purposes within practical limits consistent with the role and responsibilities of emergency medical care givers.

Death Situation Guidelines

- **I. Preserve life:** While forensic guidelines emphasize that the scene should not be disturbed, the first and most important course of action is to follow all usual procedures to ensure the preservation of life.
- **II. Once Death is confirmed:** If the decedent is clearly dead, the body should not be moved or disturbed unless there is a danger that the body may be lost or further damaged.
 - A. Maine statutes do not require a pronouncement of death.
 - **B.** The scene should be secured and left undisturbed.
 - **1.** If the police are present, they should take charge in order to determine whether the case falls under the jurisdiction of the Office of Chief Medical Examiner (OCME) or may be certified by the private attending physician.
 - **2.** If there is no police officer present, EMS should call the local police or call the OCME directly to report the case, so that a determination may be made as to the need for further investigation into the cause and manner of death. OCME emergency line to report deaths: 1-800-870-8744.
 - **3.** If it is determined not to be a Medical Examiner case, try to accommodate the family's request or contact OLMC for guidance.
 - 4. Consider contacting the New England Organ Bank 1-800-446-6362
 - **C.** Tubes and medical devices should be left in place. Certain reusable equipment may be removed to resupply the ambulance; however written documentation of any such action must be given to investigators.
 - **D.** Any clothing or property should be left undisturbed.

III. What is a Medical Examiner (ME) case?:

- **A.** Any suspected HOMICIDE
- B. Any suspected SUICIDE
- **C.** Any death involving any ACCIDENT or INJURY
- **D.** Any death of a CHILD
- E. Any death in CUSTODY
- F. Deaths caused by SUSPECTED GROSS NEGLIGENCE during a Medical Procedure
- **G.** SUDDEN DEATH from an UNKNOWN cause or any death where there is no private attending physician
- H. UNIDENTIFIED persons
- I. OCCUPATIONAL Deaths (Work related)
- J. Unnatural Deaths in a Mental, Residential Care of DHS Facility
- K. Any death that might ENDANGER or THREATEN the Public Health

Page 126 Grey 5

Death Situations for Emergency Responders #2

IV. Deaths in Children:

- **A.** All deaths in children under the age of three automatically become medical examiner cases unless the death is expected based on previously diagnosed natural disease.
- **B.** Determination of the cause of death in infants and children is very difficult. While the OCME understands the concerns of the parents, the child must be left undisturbed until investigating police officers have finished the initial investigation. SIDS is not an acceptable reason to transport a deceased infant or allow the infant to be moved prior to investigation.

V. Reports and follow- up on Medical Examiner cases:

- **A.** If families have questions, they may be referred to the OCME. Families should call the office using the 24 hour business line at 207-624-7180
- **B.** Copies of EMS run sheets should be given to police investigators and/or the OCME.
- **C.** If any EMT wishes follow-up information on any specific case, or if there is a question of infectious exposures, call the OCME on the business line, 207-624-7180.

Page 127 Grey 6

Mass Casualty/Disasters/HazMat #1

GENERAL RESPONSIBILITY FOR DECEASED PERSONS: The Office of Chief Medical Examiner is responsible for deceased victims of mass disasters including identification and removal from the scene. The Office of Chief Medical Examiner (1-800-870-8744, restricted emergency call number) should be informed immediately of any multiple fatality situations.

- 1. BODIES SHOULD BE LEFT IN PLACE AT SCENE except when they must be moved to preserve them from destruction or when they block access. The resting place of the victim may be critical for identification of the body and/or reconstruction of the incident. They can be tagged as fatalities to prevent other medical personnel from repeating examination.
- 2. IF DEATH OCCURS EN ROUTE TO THE HOSPITAL, the body need not be returned to the scene but can be brought to the hospital or other suitable storage place as determined by distances and needs of other patients in the ambulance. If the body is left anywhere other than the hospital or designated temporary morgue, the body should be tagged and the Office of Chief Medical Examiner should be advised.
- **3.** THE SITE A VICTIM IS REMOVED FROM SHOULD BE NOTED on a tag along with the name and agency of the person who removed it whenever removal is needed and in cases of death after removal. Such information may be critical for identification of the body and/or reconstruction of the accident.
- **4.** IF AN IDENTIFICATION OF A PATIENT IS MADE, a tag with at least the name and date of birth of the patient/deceased along with the identifier's name, relationship, address and where he/she can be located should be put on the body.
- **5.** PERSONAL PROPERTY SHOULD BE LEFT WITH THE BODY including clothing removed from a patient if the victim dies. Nothing should be removed from those already deceased.

Consistent with New England EMS Council MCI Management, the action priorities for the first medical crews arriving on the scene are:

- 1. Assess and avoid exposure to existing dangers
- 2. Notify dispatch of type of MCI and estimate of number and type of patients
 - a. Request EMS, fire, police assistance
 - b. Request hospital notification
- **3.** First ambulance or other vehicle with medical frequencies becomes EMS command vehicle locate near fire and police command vehicles. Strip equipment/supplies place in equipment area (near planned patient collection/treatment area).
- **4.** Designate, in the following order, the following positions as qualified personnel become available:

EMS CONTROL OFFICER – Reports to Incident Commander. Responsible for overall patient triage, treatment, and transportation. Procures EMS back-up, supplies, equipment, transport vehicles as needed, supervises and assigns all other medical personnel.

(continued next page)

Page 128 Grey 7

Mass Casualty/Disasters/HazMat #2

PRIMARY TRIAGE OFFICER – Rapidly assesses all patients then assigns personnel to provide treatment to those patients in most need of immediate treatment, who will most benefit from immediate care with the resources available. Treatment is limited to:

- Bleeding rapid pressure dressing if severe
- Airway reposition patient
- Shock elevate extremities

SECONDARY TRIAGE OFFICER – Rapidly tags all patients, or assigns personnel to do tagging (with METTAGS, SMART Tags, or other locally approved Triage System) and, supervises immobilization after classification, and oversees transfer to collection/treatment area.

Tag categories are:

RED (I): Conditions requiring immediate transport by ambulance to prevent jeopardy to life or limb and which will not unduly deplete personnel/equipment resources (examples: progressive shock, major blood loss, major multiple injuries, severe respiratory distress. Cardiac arrest – only if personnel can be spared).

YELLOW (II): Not requiring immediate transport to prevent jeopardy to life or limb, but eventually will require ambulance transport to hospital for attention.

GREEN (III): Minor conditions probably not requiring ambulance transport to hospital.

BLACK (O): Are obviously dead, or dying from lethal injuries, or requiring CPR when no personnel available to do so without compromising other patients.

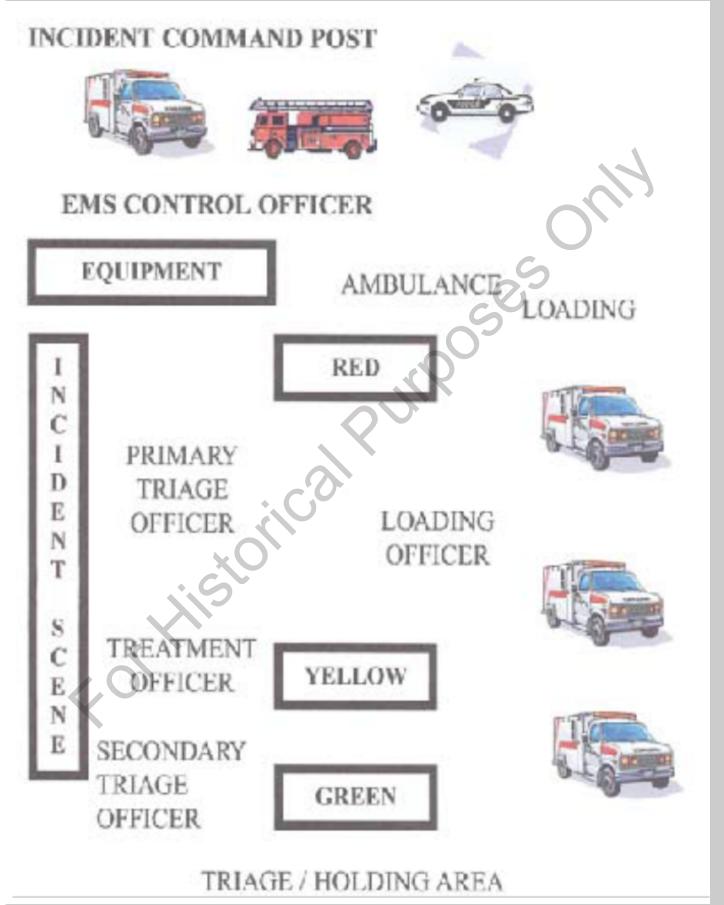

TREATMENT OFFICER – Sets up / supervises patient collection / treatment area. Reassesses and re-tags (if necessary) patients, assigns patients and personnel to treatment areas. Prioritizes for transport. Coordinates with Loading/Transport officer to make single radio transmission to receiving facility (pt. ID#, METTAG priority, nature of injury, ambulance, and ETA ONLY).

LOADING OFFICER – Stages ambulances in holding area. Instructs crews to put all available equipment in equipment area. Assigns patients to vehicles. Directs drivers to hospital(s). Instructs not to contact hospital unless OLMC required for condition change. Notifies hospital, or coordinates communication to hospital notification times, patient ID#'s and destination of all transporting vehicles.

In the event of a public health emergency or declared disaster, EMS providers may be asked to divert selected patients with certain conditions to hospital-established or state-established alternate care sites by OLMC.

Page 129 Grey 8

Suggested Scene Organization (Not for HazMat)

Page 130 Grey 9

Sexual Assault Victim

ALL LEVELS

- 1. Treat any life-threatening emergency first and according to these protocols.
- 2. Try to attend to maintenance of forensic evidence. Try not to cut through tears or stains in clothing. Do not cleanse any skin area more than necessary to provide immediate care.
- 3. If the patient so desires and/or mandated reporting is indicated, police should be called if they have not already been notified.
- 4. If no life-threatening situation is present, prehospital care may require waiting for police to secure the scene which is a potential crime scene.
- 5. Victims of sexual assault commonly have much guilt, and may require psychological support. Please respect the stress that they are enduring.
- 6. By nature of this event, any touch may be traumatic for this patient. Overtly and repeatedly explain what you are doing to try to lessen the impact of procedures and touching.
- 7. Advise the patient not to eat, drink, smoke, bathe, change clothing or go to the bathroom if at all possible in order to preserve any forensic evidence. If they must urinate, request that they do not wipe.
- 8. If the patient has removed any clothing worn in the assault, each piece of clothing should be separately bagged in paper bags and brought to the hospital with the patient.
- 9. When transporting the patient, it is preferable whenever possible to have a same sex provider as the primary provider. If the assault is a same sex assault, than a provider of the opposite sex may be more comfortable for the patient.
- 10. To maintain privacy and confidentiality, use a land-line for hospital reporting whenever possible and do not clarify the type of assault, only that you are transporting a "victim of assault."
- 11. The patient should be encouraged to go to the hospital for a sexual assault forensic examination that would allow not only the option to have collection of forensic evidence, but also treatment of possible injuries and the chance to obtain pregnancy and sexually transmitted disease prophylactic treatment.
- 12. If the patient refuses treatment and/or transportation to the hospital, document all findings and observations as completely as possible. When signing the patient off at the scene, try to have a police officer witness this sign off.

Page 131 Grey 10

Child Abuse Management and Reporting #1

CHILD ABUSE (Title 22 MRSA, Chapter 1071, Subsection 4011-A)

All levels

- Child abuse and child neglect are sufficiently widespread to guarantee that virtually every EMS provider will encounter them at least once during his/her career.
- It is estimated that approximately 2-3 million cases occur each year or approximately 11 cases per every 1,000 children within the U.S. Each year at least 2,000 children die from physical abuse.
- The most commonly identified forms of abuse by the EMS provider are physical abuse and severe physical neglect, although sexual abuse may on occasion be observed.
- The EMS provider must at all times demonstrate and maintain a supportive and non-judgmental attitude with primary caregivers. Accusation and confrontation delay immediate treatment as well as transportation to a definitive care facility.
- When abuse is a possibility, the healthcare professional has two major responsibilities: first, to provide medical care to the child; and second, to collect and document all information that may possibly establish the occurrence of abuse or neglect. Refrain from asking the child too many questions and specifically do not ask any leading questions keep questions simple and open-ended such as "What happened?" and "Are you hurt?"
- As an EMS provider, you must report immediately to Child Protective Services any child whom you have "reasonable cause to suspect" has been abused or will be abused. Failure to do so is punishable as a civil violation. It is not enough to tell someone else of your suspicions. If a child is abused and unreported, there is a 50% chance that the child will be abused again and a 10% chance that the child will die from future abuse.

Possible Indicators of Abuse

- 1. Injured child under two years of age, especially hot water burns or fractures
- 2. Facial, mouth, or genital injuries
- 3. Multi-planar injuries (front and back, right and left) especially when not over bony prominences
- 4. Poor nutrition or poor care
- 5. Delay in seeking treatment
- 6. Vague, inconsistent, or changing history
- 7. Refer to appropriate protocol for the comatose child, **Pink 5**, the child in shock, **Pink 14** or the child in cardiac arrest, **Pink 1**7

Treatment of suspected child abuse in the field

- 1. Suspect abuse but do not accuse the caretaker. Every time a child is encountered by the healthcare professional having a traumatic injury, the question that should come to mind is, "Could this be abuse?". In most cases the answer will be an obvious "no"; however, enough uncertainty will exist in some cases to warrant further assessment.
- 2. Follow normal initial assessment priorities of the ABC's and mental status when caring for the child.
- 3. Provide the appropriate intervention procedures for any abnormal findings such as respiratory, trauma, or other medical emergencies; shock; or altered mental status.

Page 132 Grey 11

Child Abuse Management and Reporting #2

- 4. EMS providers are in key positions to assess environmental conditions and the observable interactions of family and child. Environmental signs of possible abuse or neglect may include but are not limited to: unsanitary conditions; garbage scattered about the house; unsafe conditions such as open, unguarded windows or potentially dangerous objects within reach of children.
- 5. Perform a detailed physical examination on any child in stable enough condition to allow for such. Examine all parts of the body for deformities, ecchymosis, lacerations, abrasions, punctures, burns, tenderness, and swelling. It is vitally important that injuries of the mouth and sternum be observed in detail prior to the initiation of resuscitative measures and documented that such injuries were found prior to resuscitation.
- 6. It is important to transport all children having evidence of abuse or neglect due to the possibility of additional injuries not immediately obvious. Transport of potentially abused or neglected children ensures that they receive the appropriate and necessary social service. Assistance may be necessary from law enforcement, OLMC, etc.
- 7. Convey your impressions and information to the hospital staff.
- 8. Write a detailed and descriptive report, which provides an accurate and clear record of all observations and treatment from the time of the initial call through transfer of the patient to the ED staff. Do not make a diagnosis of abuse, and refrain from including personal opinions, emotional overtones, or interpretations. Primary caregiver quoted statements must be documented as such with quotation marks, and exactly word for word as stated by the person. As well, this legal document must be legible.
- 9. You must contact Adult and Children's Emergency Services at 1-800-452-1999 to make a report. This is a 24-hour a day reporting number. You will be protected by law from civil liability for making such a report if made in good faith. Title 22 MRSA, Chapter 1071, Subsection 4014

AN ACT TO STRENGTHEN THE LAWS GOVERNING MANDATORY REPORTING OF CHILD ABUSE OR NEGLECT.

(Title 22 MRSA Section 4011-A, Subsection 7)

Children under 6 months of age or otherwise non-ambulatory. A person required to make a report under subsection 1 shall report to the department if a child who is under 6 months or age or otherwise non-ambulatory exhibits evidence of the following:

- a. Fracture of the bone
- b. Substantial bruising or multiple bruises
- c. Subdural hematoma
- d. Burns
- e. Poisoning, or Injury resulting in substantial bleeding, soft tissue swelling, or impairment of an organ

Page 133 Grey 12

Adult Abuse, and Intoxicated Drivers

ADULT ABUSE (Title 22 MRSA, Chapter 958-A, Subsection 3477)

"Reasonable cause to suspect. The following persons while acting in a professional capacity...ambulance attendant, emergency medical technician or other licensed medical service provider, Unlicensed assistive personnel shall immediately report to the department when the person knows or has reasonable cause to suspect that an incapacitated or dependent adult has been or is likely to be abused, neglected or exploited."

Call Adult Protective Services: 1-800-624-8404 (24 hours a day). Similar protection from liability for reporting exists.

INTOXICATED DRIVERS (Title 29- A)

§ 2405 (1) "Persons who may report If, while acting in a professional capacity a...emergency medical services person...knows or has reasonable cause to believe that a person has been operating a motor vehicle, hunting or operating a snowmobile, all-terrain vehicle or watercraft while under the influence of intoxicants and that motor vehicle, snowmobile, all-terrain vehicle or watercraft or a hunter has been involved in an accident, that person may report those facts to a law enforcement official."

§ 2405 (2) Immunity from liability. A person participating in good faith in reporting under this section, or in participating in a related proceeding, is immune from criminal or civil liability for the act of reporting or participating in the proceeding.

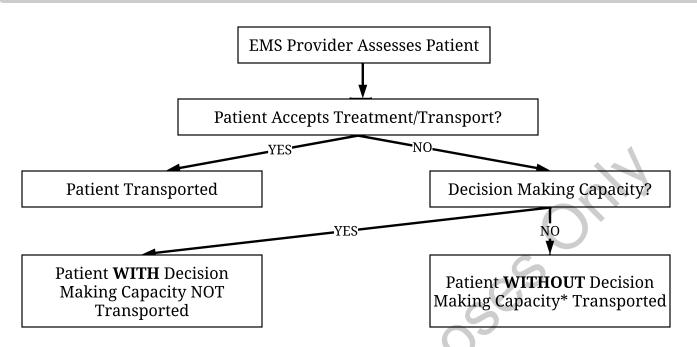

§ 2524 (1) Persons qualified to draw blood for blood tests. "Only a physician, registered physician's

assistant, registered nurse or person whose occupational license or training allows that person to draw blood samples may draw a specimen of blood for the purpose of determining the blood-alcohol level or the presence of a drug or drug metabolite."

§ 2528 Liability. "A physician, physician's assistant, registered nurse, person whose occupational license or training allows that person to draw blood, hospital or other health care provider in the exercise of due care is not liable for an act done or omitted in collecting or withdrawing specimens of blood at the request of a law enforcement officer pursuant to this chapter."

Page 134 Grey 13

Transport Protocol #1

^{*}A patient without decision making capacity would be one who has one of the following: an altered mental status or intoxicated, confused, delirious, psychotic, comatose, unable to understand the language, or is a minor, etc.

- 1. If there is a question of decision making capacity or the patient does not appear to understand the consequences of his/her refusal of transport, then contact OLMC.
- 2. The patient must be informed of the consequences of his/her refusal to be transported. This must be documented in the patient care report.
- 3. This screening may typically arise when an ambulance is requested by someone other than the patient (i.e. the police, a bystander). The EMS run report must always be completed.
- 4. If the patient refuses transport and is judged to be without decision making capacity, the EMT must speak directly with OLMC. If unable to reach OLMC, the patient is transported.
- 5. EMS System initiated patient sign offs are tremendously risky interactions and are not condoned by Maine EMS.
- 6. The service is expected to review all patient sign offs through the service's quality assurance mechanism. Patient medical records must be completed for all of these interactions, including the following information:
 - a. The patient must be calm, competent, sober, and alert with the absence of an acute medical/surgical or traumatic process that impairs the patient's capacity
 - b. Greater than 18 years, emancipated, or contact with guardian
 - c. Service(s) offered
 - d. Reason service(s) declined
 - e. Statement of risks and patient understanding of risk
 - f. Discussion of alternatives to service offered and potential consequences of declining offered service
 - g. Discussion with patient that EMS services may be accessed at any time, and that the patient had decision making capacity.

Page 135 Grey 14

Transport Protocol #2

7. In some circumstances, patient transport is requested by an off site medical provider. Should a patient refuse transport and be found to have decision making capacity, EMS providers should communicate the discovery of decision making capacity and the patient's right to refuse transfer with invested parties. OLMC or the physician ordering transport must be contacted by EMS in this decision making process. It is suggested that the consulted physician discuss directly with the patient.

8. When the patient is found to lack decision-making capacity but continues to refuse transport, contact OLMC for assistance. Should the patient continue to refuse transport, consider accessing other community advocates and resources (such as family/friend when appropriate and/or police). Consider direct dialogue between OLMC and the patient or OLMC and law enforcement to assist in resolving the conflict.

Page 136 Grey 15

Transport of Mentally Ill Patients

Maine EMS personnel are generally called to transport a mentally ill patient in one of two situations:

Emergency Transport

Safety for the patient and the crew is the primary concern in the transport of the mentally ill patient. Personnel should make sure they do a thorough evaluation of the patient to find and treat possible medical causes of the behavior. Refer to the Agitation/Excited Delirium Protocol, **Yellow 12**.

EMS personnel are authorized under Maine law as physician extenders to physically restrain any patient who poses a threat to themselves or others. Providers are cautioned to use physical restraint as a last resort, preferably with the assistance of local law enforcement. Once the decision is made to restrain a patient, the patient should remain restrained until arrival at the emergency department, unless it interferes with the delivery of medical care.

Non-Emergency Transfer

Mentally ill patients who are being transferred usually fall into one of these categories:

<u>Voluntary Committal</u> – These patients have agreed to be transferred to a facility for evaluation and treatment of an underlying mental illness. It is important to get a thorough report on the patient prior to transport to avoid surprises en route. Voluntary committal patients can change their mind during transport. In this case, it is the responsibility of the EMS personnel to discharge the patient at a safe location, preferably at the originating facility. If it is not possible to return the patient to the originating facility, notify local law enforcement to meet you at your location.

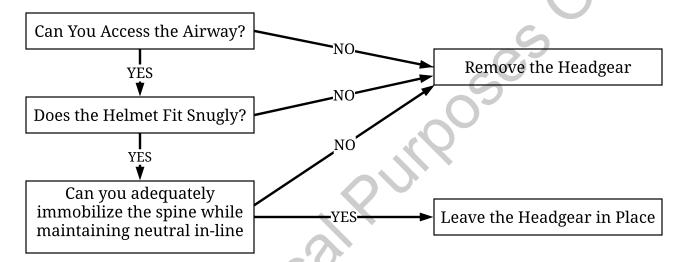

Involuntary Committal – Patients who are being committed involuntarily must have committal papers (blue papers) completed prior to transport. Between the hours of 7 a.m. and 11 p.m. a judge has to sign the committal papers. After 11 p.m. and before 7 a.m. the papers do not have to be signed except for Riverview Psychiatric Center (formerly AMHI) – this is known as the "pajama clause". Make sure that the transporting service is listed correctly on the papers. According to Maine law, the patient must be transported in the least restrictive form of transportation available. Make sure you get a thorough history to determine whether restraints will be necessary. If the receiving facility refuses to accept the patient after evaluating them, the transporting service is required by law to transport the patient back to the originating facility.

Page 137 Grey 16

Protective Headgear Removal

The decision to remove protective headgear from an injured patient rests with the EMS provider on scene unless a Maine licensed physician is on scene and takes responsibility for the patient. It is important to immobilize the patient in a neutral in-line position, regardless of whether or not you choose to remove the helmet. This requires that you evaluate each patient and determine if other equipment (i.e. shoulder pads) must be removed or if additional padding under the shoulders or head is necessary. In the case of an athletic injury, the EMS provider should consider input from athletic trainers. Disputes should be referred to OLMC for resolution.

When deciding whether to remove protective headgear, please evaluate the following criteria:

Page 138 Grey 17

Defibrillation/Cardioversion Setting

DEFIBRILLATION SETTING*

	Initial	Second	Third	Subsequent
Adult	360 J	360 J	360 J	360 J
Pediatric	2 J/kg	4 J/kg	4 J/kg	4 J/kg

^{*} Adult 360 J monophasic or MEP or equivalent biphasic for all attempts

CARDIOVERSION SETTING*

	Initial	Second	Third	Subsequent
Adult (VT)	100 J	200 J	300 J	360 J
Adult (SVT)	50 J	100 J	200 J	300 J
Pediatric	0.5-1.0 J/kg	2 J/kg	2 J/kg	2 J/kg

^{*} Use closest machine setting possible

For biphasic defibrillation device, use monophasic equivalents as noted above

Page 139 Grey 18

Maine EMS Medication List

The following are medications currently approved for use by Maine EMS licensees - as authorized by the Maine EMS Protocols. This list may be altered through protocol revision.

Prehospital Medications:

Acetaminophen chewable tablets

Activated Charcoal (without sorbitol)

Adenosine

Albuterol

Amiodarone

Aspirin

Atropine

Cyanide poisoning kit contents

Dexamethasone

Dextrose (D_{10}, D_{50})

Diphenhydramine

EPINEPHrine 1 mg/mL (1:1000) & 1 mg/10mL (1:10,000)

EPINEPHrine Auto-injector

Fentanyl

Glucagon

Hemostatic Agents

Heparin Solution (for use in maintaining IV access in a heparin lock only; otherwise this is not considered a prehospital medication. Approved also at Advanced EMT level).

Ipratropium Bromide (Combivent)

Ketamine

Lidocaine 2% (preservation free)

Magnesium Sulfate

Metoprolol (Lopressor)

Midazolam

Naloxone (Narcan)

Nitroglycerin (Non-parenteral)

Nitrous Oxide

NOREPInephrine

Oxygen

Ondansetron IV and ODT

Tetracaine Ophthalmologic Drops

Tranexamic Acid (TXA)

Sodium Bicarbonate

Non-EMS System Medical Interveners

Thank you for your offer of assistance.

Please be advised that these Emergency Medical Technicians are operating under the authority of the State of Maine and under protocols approved by the State of Maine. These EMS providers are also operating under the authority of a Medical Control physician and standing medical orders.

If you are currently providing patient care, you will be relinquishing care to these EMS personnel and their Medical Control physician.

No individual should intervene in the care of this patient unless the individual is:

- 1. Requested by the attending EMT, and
- 2. Authorized by the Medical Control physician, and
- 3. Is capable of assisting, or delivering more extensive emergency medical care at the scene

If you are the patient's own physician, PA, or nurse practitioner, the EMTs will work with you to the extent that their protocols and scope of practice allow.

If you are not the patient's own physician, PA, or nurse practitioner, you must be a Maine licensed physician who will assume patient management and accept responsibility. These EMTs will assist you to the extent that their protocols and scope of practice allow. They will not assist you in specific deviations from their protocols without Medical Control approval. This requires that you accompany the patient to the hospital and that their Medical Control physician is contacted and concurs.

The EMS providers or medical control may request that you provide evidence that you are a Maine licensed physician: a copy of your pocket card, an identification issued by a Maine Hospital or healthcare agency, or confirmation of active license status through the Maine Board of Medicine or Nursing website at:

https://www.pfr.maine.gov/ALMSOnline/ALMSQuery/SearchIndividual.aspx?Board=383

MDs, DOs, PAs and NPs are listed at the same website.

For MDs and PAs - select Regulator "Medicine"

For DOs - select Regulator "Osteopathic Medicine"

For NPs - Select Regulator "Nursing"

Pulseless V-Tach	Red 13-14	40-41
Radio Contact Numbers	Grey 20	141
Recurrent V-Fib	Red 10	37
Refractory V-Fib	Red 10	37
Refusal of Transport or Care	Grey 14-15	135-136
Refusals	Brown 4-5	13-14
Remodulin	Blue 12	27
Respiratory Distress - Adult	Blue 8	23
Respiratory Distress - Pediatric	Pink 8	106
Respiratory Distress with Stridor - Pediatric	Pink 12	110
Respiratory Distress with Wheezing - Pediatric	Pink 10-11	108-109
Respiratory Failure - Pediatric	Pink 9	107
Rule of 9's	Green 16	78
Seizures - Adult	Gold 7-8	54-55
Seizures - Pediatric	Pink 6-7	104-105
Septic Shock - Adult	Gold 12-13	59-60
Septic Shock - Pediatric	Pink 14-15	112-114
Sexual Assault	Grey 10	131
Shock - Classification of	Green 14	76
Shock - Pregnancy	Green 13-14	75-76
Sign-offs	Brown 4-5	13-14
Special Circumstances Protocol	Brown 5	14
Spine Assessment	Green 6	68
	1	1

Spine Management	Green 7-8	69-70
ST Elevation Myocardial Infarction (STEMI)	Red 2-3	29-30
STEMI Criteria	Red 3	30
Stridor - Pediatric	Pink 12	110
Stroke	Gold 9-11	56-58
Stroke Checklist	Gold 11	58
Stroke Scale	Gold 9	56
Submersion Injuries	Yellow 17	98
Syncope	Red 18	45
Tachycardia	Red 13-14	40-41
Taser Probes	Brown 6	15
Telephone Contact Numbers	Grey 20-21	141-142
Termination of Resuscitation	Red 11	38
Termination of Resuscitation - Trauma	Green 19	81
Tourniquets	Green 11	73
Toxins	Yellow 1-3	82-84
Transport - Refusal	Grey 14-15	135-136
Transport of Mentally III	Grey 16	137
Trauma - Chest	Green 10	72
Trauma Head	Green 12	74
Trauma Pain Management - Pediatric	Pink 3-4	101-102
Trauma Triage	Green 3-5	65-67
Tricyclic Antidepressants - Toxins	Yellow 4	85
TXA -Tranexamic Acid	Green 13-14	75-76
Universal Pain Management	Green 17-18	79-80
VAD - Ventricular Assist Device	Red 19-20	46-47
Vagus Nerve Stimulator	Brown 5, Gold 8, Pink 7,	14, 54, 405
Vital Signs - Pediatric	Pink 22	120
Vomiting - Adult	Gold 15	62
Vomiting - Pediatric	Pink 2	100
V-Tach	Red 13-14	40-41
Wheezing - Pediatric	Pink 10-11	108-109
Wide Complex Tachycardia	Red 13-14	40-41
Wong-Baker Pain Scale	Pink 4	102
Wound Management	Green 11	73
