

BACKGROUND

Each year, MDIFW biologists, contractors, and volunteers examine roughly $\frac{1}{4}$ of all harvested deer. They look at things like sex, age, weight, yearling antler beam diameters, antler points, and lactation status. From adult deer, they will often pull an incisor tooth, which will be aged under a microscope in a lab. These results are used to look at population age structure as well as provide age estimates for hunters who indicate an interest in the age of their harvested deer.

At the end of the report, you will find summary age structure figures for 2019 harvested deer organized by MDIFW Region. A map of MDIFW Regions will be included as well for reference. To produce these figures, we try to sample at least 150 adult deer of each sex in each Region, though we do collect more samples from southern Maine where most of our deer live and most of our harvest occurs. This sample size is intended to be enough to represent out to five age classes: yearling, 2 year old, 3 year old, 4 year old, and 5+ year old; however, we are not able to collect enough samples from some sex-age classes in some areas. This is particularly an issue in northern Maine where antlerless harvest is limited, which limits our ability to sample from female deer.

Thank you very much for providing our Department with the samples required to do these analyses.

2019 DEER AGES

Below are estimated ages for 2019 harvested deer. They are listed alphabetically by last name, then first name. If you did not specifically request that your deer be aged when the tooth was pulled, it may not be present in the sample; only a sub-sample of all teeth that are collected are sent to the lab for aging in addition to specific age requests. Furthermore, not all teeth sent to the lab are able to be aged. This may be the case if the incorrect tooth was pulled, the root of the tooth was broken or cracked, or the confidence level in the age was just low. At the end of the list of names, there are some seal numbers that could not be paired with a name; if you do not see your name but know your seal number, it may be worth looking there. An "X" for age means the lab received the tooth but was not able to age it, likely due to the tooth being broken or incomplete.

FIGURES

MDIFW Regions.

Maine Fisheries and Wildlife Regions

Age structure by Region and sex. Sample sizes are indicated in the figure titles (n= #). Low samples (less than 100) result in relatively low confidence in the overall age structure.
