- Banded killifish
- Threespine stickleback

Physical Characteristics

Area - 74 acres
Maximum depth - 3 feet

Temperatures:
- Surface - 72°F
- 3 feet - 72°F

Principal fishery: Brook trout

Bartlett Pond is an extremely shallow pond with its shoreline surrounded by heath bog. The bottom is heavily silted.

The northeast inlet contains fair spawning areas and good to excellent nursery areas for trout. Bartlett Brook, another major inlet, provides excellent spawning and nursery areas. The outlet also provides very good spawning and nursery area for trout. There are times when these waters are made impassible to trout by beaver dams thus limiting their productivity.

Large populations of yellow perch and fallfish compete with brook trout for food and space.

Access is via private gravel roads built and maintained by large landowners for forest management purposes. A short paddle up the outlet is required to reach the pond.
