Indian Pond, a shallow pond with a firm mud bottom, is surrounded by a gradual slope on the west side and flat hardwood ground on the east side. Water quality is suitable for brook trout, with adequate temperatures and oxygen content. The outlet has a limited amount of spawning gravel, but beaver dams below the pond make it unavailable to trout. A small inlet in a spruce-cedar swamp on the south end provides no spawning facilities.

Competition from the more aggressive suckers and chubs has probably kept the brook trout population at a minimum. Fall fingerling trout were stocked on a trial basis in the fall of 1965. If these trout provide a fishable population, regular stocking will be undertaken. The existing general law is sufficient at this time.

Indian Pond is primarily accessible by airplane, but also may be reached via a gravel road and trail from Skinner.
