DUTTON POND
Amherst Twp., Hancock Co.
U.S.G.S. Great Pond, Me.

Fishes

Brook trout (squaretail)  Minnows
White sucker  Golden shiner
               Creek chub
               Pumpkinseed sunfish

Physical Characteristics

Area - 17 acres  Temperatures
Maximum depth - 35 feet  Surface - 79° F.

Dutton Pond is one of the small ponds that drain down into the West Branch of the Union River. You can reach it by a series of roads that branch off the "airline," Rt. 9, in the village of Amherst. Sections of the access road are not passable with late-model cars. There is no good boat landing. An unusual feature of Dutton Pond is its shoreline. The shores are lined with huge rocks, and the bottom pitches abruptly into deep water. It is a fine pond for fishing trout from shore.

You should consider Dutton Pond a brook trout pond. The single, small, intermittent tributary will not produce enough trout naturally to provide a dependable trout fishery and we suggest periodic stocking with brook trout to help sustain the fishery.

Surveyed - August, 1961
Maine Department of Inland Fisheries and Game
