DIVISION 800

MISCELLANEOUS DETAILS
GENERAL NOTES:
1. The sidewalk width shall be paved in all cases.
2. All residential or commercial entrances 10% and over shall be paved.

NOTES ON MAXIMUM ENTRANCE PROFILES:
1. These profiles are a guide for the majority of cases, but should be field checked when the main line grade is steep (4% to 6% or greater) or the angle of approach to the entrance is unusual.
2. Generally the majority of entrances on a project will be built with flatter profiles than these maximum cases.
3. When grading entrances which are flatter than the maximum profiles the following rule of thumb should be used. Do not exceed a grade % change of more than 9% in a 6 foot increment of entrance length. This applies to both up and down profiles.
4. Entrances with grades exceeding 15% must have a design exception. Field entrances with grades exceeding 22% must have a design exception.
5. Any design change to an existing entrance that is steeper than (+ or -) 6% that adversely changes the grade (+ or -) by more than 3% will require a design exception.

ENTRANCES ON SIDEWALK SECTIONS
801(01)
Use on either curbed or non-curbed sections.

Subgrade

Level to -4%

Enters

3'-0" 3'-0" 6'-0" 6'-0"

1'-0"

Use on either curbed or non-curbed sections when drainage is a factor. (Always construct berm behind curb to prevent gutter drainage from entering entrance.)

Subgrade

* -9% max. -15% max.

Edge of Shoulder or Gutter Line

Use only on non-curbed sections on seasonal or limited use entrances or when drainage is not a factor.

GENERAL NOTES:
1. The first 3 feet shown as pavement shall be paved only when abutting a paved area.

2. All residential or commercial entrances 10% and over shall be paved.

NOTES ON MAXIMUM ENTRANCE PROFILES:
1. These profiles are a guide for the majority of cases, but should be field checked when the main line grade is steep (4% to 6% or greater) or the angle of approach to the entrance is unusual.

2. Generally the majority of entrances on a project should be built with flatter profiles than these maximum cases.

3. When grading entrances which are flatter than the maximum profiles the following rule of thumb should be used. Do not exceed a grade % change of more than 9% in a 6 foot increment of entrance length. This applies to both up and down profiles.

4. Entrances with grades exceeding 15% must have a design exception. Field entrances with grades exceeding 22% must have a design exception.

5. Any design change to an existing entrance that is steeper than (+ or -) 6% that adversely changes the grade (+ or -) by more than 3% will require a design exception.

\* Design exception to be approved by Program Manager (or designee).

ENTRANCES ON NON-SIDEWALK SECTIONS

801(02)
Provide 3' min. paved apron for gravel entrances on all projects.

Match existing entrance width at limit of grading.

Radii apply to all angles of entrance.

Entrance angle should not be less than 45°.

~ GRAVEL ENTRANCE ~  ~ PAVED ENTRANCE ~

1. Entrance angle should not be less than 45°.
Entrances with a high number of truck movements may be designed on an individual basis.

Provide 3’ min. paved apron for gravel entrances on all projects.

Maintain designated radii for all entrances skewed or square.

Edge of Shoulder

Edge of Travel Lane

Highway

42’ max.

42’ max.

= GRAVEL ENTRANCE =

= PAVED ENTRANCE =

Entrance angle should not be less than 45°.
NOTES:
1. This type of entrance is suitable for other high traffic volume, public-type installations.

2. All island borders shall be curbed.
RESIDENTIAL ENTRANCE ONTO CURBED HIGHWAY (WITH/WITHOUT SIDEWALKS)

NOTES:

1. Minimum curb opening is 20' where the shoulder width is ≥ 6' and 26' where the shoulder width is < 6'.
Minimum entrance angle is 45° where the shoulder width ≥ 6’ and 60° where the shoulder width < 6’.

If there are high truck turning volumes, the designer should consider providing turning radii of 15’ - 25’ and/or a wider opening and/or limiting the angle of turn to accommodate trucks.

**UNCURBED COMMERCIAL/INDUSTRIAL ENTRANCE ONTO CURBED HIGHWAY (WITH/WITHOUT SIDEWALK)**

801(07)
Minimum entrance angle is 45° where the shoulder width ≥ 6' and 60° where the shoulder width < 6'.

~ PAVED ENTRANCE ~

1 Minimum entrance angle is 45° where the shoulder width ≥ 6' and 60° where the shoulder width < 6'.

T.W. = Traveled Way Pavement & Cross - slope
S. = Shoulder Pavement & Cross - slope

PAVEMENT TRANSITION AT BRIDGE
80i(10)
1. Maximums and minimums do not have tolerances and are not to be exceeded or unmet.

2. The standard turning space (level landing) is 4'-0" x 4'-0" sloping no more than 2.0%. Where the turning space is constrained, the turning space shall be 4'-0" minimum by 5'-0" minimum. The 5'-0" dimension shall be provided in the direction of the ramp run.

3. Detectable warnings shall be installed at all signed or signalized intersections. They shall have a truncated dome surface. The domes shall be in a square pattern and aligned with pedestrian traffic where possible.

4. Detectable warnings shall span the width of the pedestrian ramp. See Standard Detail 608(02).

5. All detectable warning fields placed at the same intersection shall be made up of the same uniform material type. Detectable warnings shall be contrasting in color to the adjacent walkway.

6. A ramp with a running slope less than 5.0% is defined as a "Blended Transition". Blended transitions do not require a level landing at the top of the ramp. See 801(26) for details.

7. The ramp length shall not exceed 15 feet. Adjust ramp length or slope as needed to provide access to the maximum extent feasible. See 801(03) for details.

8. All curb ramp joints and grade breaks shall be flush.

9. Ramp grade breaks shall be perpendicular to the running slope.

10. There shall be a minimum of 12" Aggregate Subbase Course - Gravel under the sidewalk surface on pedestrian ramps.

11. Drainage structures, traffic signal equipment, or other obstructions shall not be installed in the curb ramp or turning space areas.

12. Before retrofitting ramps, the contractor shall verify removal limits are sufficient to provide positive drainage, maintain existing drainage patterns, and avoid ponding in the final configuration.

13. A temporary pedestrian access route shall be provided whenever the existing pedestrian access route in the public right of way is blocked by construction, alteration, maintenance, or other temporary conditions. Refer to MUTCD for guidance.

**PEDESTRIAN RAMP REQUIREMENTS**

801(12)
Choose roadway profile grade by rounding up for positive grades and down for negative grades. Round to the nearest whole integer. If constraints prevent placement of the ramp length required by the table, place the maximum length possible and check the slope. If above the maximum allowable slope, consider design modifications before considering technical infeasibility.

802(17)
1. Payment for connection from the inspection standpipe to the proposed underdrain system shall be a 6 inch underdrain outlet, item no. 605.10, or as directed by the resident.

2. Inspection standpipe shall have a solid cover and be installed within the state’s right of way.

3. A check valve to prevent back flow to property may be installed. Check valve should be installed at the upstream side of the inspection standpipe and outside of the state’s right of way. Installation of check valve shall be the responsibility of the property owner.

4. Payment for connection of the existing cellar drain to the inspection standpipe shall be incidental to the item no. 801.141 or 801.16.

5. The station locations may be changed to fit field conditions, as directed by the resident.

6. A 3 foot length of #4 rebar shall be placed adjacent to standpipe and flush with cap. Installation of the rebar and the concrete footing shall be incidental to item no. 801.141 or 801.16.
The bituminous binder material for the mixture shall be viscosity grade AC-10 or 20 asphalt cement.

The density requirements are waived.

**ADDITIONAL PAVING NOTES**

The Department will pay for the work specified in Subsection 401.11 for the HMA used, except that cleaning objectionable material from the pavement and furnishing and applying Item 409.15 bituminous material to joints and contract surfaces is incidental.

A tack coat of emulsified asphalt, RS-1 or HFMS-1, Item 409.15 shall be applied to any existing pavement at a rate of approximately 0.025 gal/sq.yd, and on milled pavement approximately 0.05 gal/sq.yd, prior to placing a new course. All joints between existing and new pavement will be tacked.

Crossings shall be paved within 20 days following the completion of the crossing reconstruction.

Paved shoulders within the gage of the rail to point 24" outside of the field side of each rail shall be a standard 6" depth of pavement. Paved shoulders outside of this area shall be paved with 2" surface mix only.

- The bituminous binder material for the mixture shall be viscosity grade AC-10 or 20 asphalt cement.
- The density requirements are waived.
RAILROAD CROSSING GENERAL NOTES

1. The highway section over railroad crossings shall be designed with a minimum of 2-lift travelways and 6' shoulders. 4' shoulders may be designed if field conditions warrant.

2. Signals shall be located as per standard detail and shall comply with the latest edition of the Manual of Uniform Traffic Control Devices.

3. The standard crossing surface shall consist of a rubber railseal interface as manufactured by Polycorp or Performance Polymers, Inc., or approved equivalent. Alternative crossing surfaces may be installed with approval of MaineDOT.

4. New 136 # prime welded rail shall be provided for crossing reconstruction. The minimum length of welded rail shall be 117' or extend 30' beyond each edge of pavement whichever is longer. The full depth excavation area shall extend 10' beyond the welded rail and excavated to a minimum depth of 12" below bottom of tie elevation.

5. 7" x 9" ties (8'6" or 9' long) shall be installed under the welded rail and shall be fully box anchored. Anchors may be omitted beneath the crossing surface in order to accommodate the installation of rubber railseal.

6. Geotextiles provided for rail crossings shall be the following minimum weights: 8 oz./s.y. for non-woven fabrics and 6 oz./s.y. for woven fabrics. The minimum width through the crossing area shall be 17'. Geotextile fabrics shall be placed throughout the entire full depth construction area.

7. Construction signs and traffic control devices shall be erected and maintained during the construction of the project.

8. Field work performed between December 15 and March 15 shall be approved in advance by the MaineDOT Resident.

9. Erosion Control shall be installed and maintained as per approved Erosion Control Plan until all permanent measures are in place.

   | No. 50 - 1/64" sieve | - 1% |
   | No. 200 - 0.003" sieve | - 2% |

3. Compaction of the new Hot Mix Asphalt Pavement will be obtained using a minimal roller train consisting of a 3-5 ton vibratory roller. An approved release agent is required to ensure the mixture does not adhere to hand tools, rollers, pavers, and truck bodies. The use of petroleum based fuel oils will not be permitted.
NOTE:
The slope of the 8' shown, in no case, shall be above the plane of the rails either side of C/L per P.U.C. General Order # 2.

RAIL ROAD CROSSING GRADING

RAIL ROAD CROSSING GRADING

803(05)
NOTE:
1. Flood lights should be provided to mark flagger stations at night as needed.
2. If entire work area is visible from one station, a single flagger may be used.
3. Warning lights should be used to mark channelizing devices at night as needed.
4. Channelizing devices are to be extended to a point where they are visible to approaching traffic.

TYPICAL APPLICATIONS OF TRAFFIC CONTROL DEVICES ON 2-LANE HIGHWAY. ONE LANE IS CLOSED AND FLAGGING IS PROVIDED.

50 mph | 850'
55 mph | 950'
60 mph | 1100'

~ SUGGESTED MIN. PAVEMENT MARKING PLACEMENT DISTANCE ~

NOTES:
1. When used, a portion of the pavement marking symbol shall be directly opposite the Advance Warning Sign (W 10-I). If needed, supplemental pavement marking symbol(s) may be placed between the Advance Warning Sign and the crossing, but should be at least 50’ from the Stop Line.

2. A three lane roadway should be marked with a centerline for two-lane approach operation on the approach to a crossing. On multi-lane roads the transverse bands should extend across all approach lanes, and individual RXR symbols should be used in each approach lane.

3. Refer to Standard Alphabet for Highway and Markings for RXR symbols details.
