2011 MIYHS GRADE 5-6 REPORT

UNDERSTANDING THE DATA - SCHOOL AND SCHOOL DISTRICT REPORTS

Student Confidentiality and Reporting Thresholds

To protect student confidentiality, responses based on fewer than 6 individuals will not be shown in any report. Also, individual reports have not been generated for schools or school districts when fewer than 20 students participated in the MIYHS. In order to receive a report, schools must have had at least a 50% student participation level in the eligible grades; school districts must have had an overall response rate of at least 50% (overall response rate = school response rate within a district x student response rate for participating schools).

How to Read this Report

For grades 5 and 6, all non-demographic questions included on the 2011 MIYHS survey instrument are presented in this report. For middle school (MS), only questions that appeared on all four survey modules are included in this report; the same applies to high school (HS). Questions are grouped by topic area.

Please note that the numbers listed to the left of the questions in this report are for formatting purposes only; they do not represent actual question numbers on the survey instruments themselves.

When questions and/or answer options have changed from 2009 to 2011 and there may be a change in the way the results could be interpreted, the word "Modified" is listed after the question. Please go to <http://www.maine.gov/dhhs/osa/pubs/data/modifiedvar.pdf> for more information on the modified variables.

Each estimate is the percentage of students who answered in the way specified in the question title; for instance, 28.0% of Maine's high school students said they had consumed alcohol at least once in the 30 days prior to taking the MIYHS.

Because the percentage is an estimate, there is some error involved. This is reflected in the Confidence Interval, which is bounded by the **Lower Confidence Limit (LCL)** and the **Upper Confidence Limit (UCL)**. Confidence intervals reflect how precise and stable the percentages are for students in your school / school district. If your report indicates that in the past 30 days 29% of your students drank alcohol and there is a confidence interval of 27% to 31%, this means that there is a 95% chance that between 27% and 31% of your students engaged in this behavior in the past 30 days, and a 5% chance that fewer than 27% or more than 31% engaged in that behavior. In other words, if the survey were conducted 100 times at your school / school district, 95 of those times the percent of students who drank alcohol in the past month would be between 27% and 31%. Wider confidence intervals reflect more variability in student responses compared to more narrow confidence intervals. The narrower the confidence limits, the more confidence we have in the percentage. In general, the greater the proportions of eligible students taking the survey, the more confidence we have that the percentages reflect the true underlying population of students.

Comparing Local Data to Maine's: Is the Difference Statistically Significant?

In the last three columns of the report, we present the results of statistical tests designed to determine whether the difference between values is more than would have been expected by chance. Your school or district is compared to the state in 2009 and in 2011, and your school/district's values for these two survey years are compared as well. If there is an "H" in a *significance tests* column, your school/district's percentage on this indicator is statistically higher than the state average or the previous survey year; if there is an "L", this indicates that your school/district's percentage on this indicator is statistically lower than the state average or the previous survey year. Another means of assessing statistical significance is to compare confidence intervals. If the confidence interval around one percentage does not overlap with the confidence interval around another percentage, then the estimates are considered significantly different.
