This fact sheet provides consumer information about the power sources and air emissions of service provided by these electricity suppliers.

*This table compares air emissions from this supplier's electricity mix to average emission levels from all New England power sources.*

	<u>Supplier's</u> <u>Mix</u> (lbs/MWh)	
<b>Carbon Dioxide (CO<sub>2</sub>)</b>	<b>683.84</b>	This is 3.72% lower than the New England Average.
<b>Nitrogen Oxide (NO<sub>x</sub>)</b>	<b>0.54</b>	This is 92.50% lower than the New England Average.
<b>Sulfur Dioxide (SO<sub>2</sub>)</b>	<b>0.34</b>	This is 44.09% higher than the New England Average.

*Notes: lbs/MWh = pounds per Megawatt-hour  
1 Megawatt-hour = 1,000 kilowatt-hours*

### Additional Information and Required Notes:

#### **Notes:**

**Power Sources**—Maine law requires retail electricity providers to periodically provide information to their customers on the mix of power sources used by the provider to serve their Maine customers' load.

**Emissions**—**Carbon Dioxide** (CO<sub>2</sub>) is released when certain fuels are burned. It is considered a greenhouse gas and a major contributor to global warming. **Nitrogen Oxides** (NO<sub>x</sub>) form when certain fuels are burned at high temperatures. They are considered contributors to acid rain and ground-level ozone (or smog). **Sulfur Dioxide** (SO<sub>2</sub>) is formed when fuels containing sulfur are burned. Major health effects associated with SO<sub>2</sub> include asthma, respiratory illness and aggravation of existing cardiovascular disease. The production of electricity can produce other harmful emissions and have other environmental impacts. Environmental impacts differ among individual power plants.
